VOL. LXII NEW YORK, THURSDAY, JANUARY 3, 1907 No. 3031

Entered at the New York Post Office as second-class mail matter.

The Year at Home and Abroad

The President's Influence

In the United States, the past year was one of great crops, increased dividends and wages, rising prices and great industrial activity. All this was shown in the review which we published on the 20th ult. In the field of national politics and legislation the dominating influence was that of President Roosevelt. This appears most clearly in the record of the session of Congress which ended on June 30th. His aim, as to domestic questions of economic policy, has been to bring the great corporations and combinations under the intimate supervision of Federal authority, to prevent a misuse of great private fortunes, and to limit the growth of such fortunes by taxation. In his speech about muckraking, last April, he warned the rich who were striving to prevent Federal control of interstate business, predicted the ultimate imposition of a progressive tax on the transmission of "fortunes swollen beyond all healthy limits," and remarked that no amount of charity in spending could compensate for misconduct in acquiring such wealth. Again, in October, at Harrisburg, he spoke in the same strain, denouncing the ingenious legal advisers of the holders of vast corporate wealth, advocating a broader construction of the Constitution in order that great wealth and powerful corporations might be curbed, and opposing Government ownership of railways as an evil to be avoided by Federal supervision and regulation. In his recent annual message he recommended the imposition of graduated Federal inheritance and income taxes, and urged further action for the control of great corporations, saying that consolidation was not to be prevented, but to be regulated and supervised, and urging the withdrawal from entry or sale of the Government's coal and oil lands in order that they might not become the property of monopolistic combinations. The legislation which he has promoted during the past year, and the important prosecutions instituted under his direction, are in accord with the policy which he has repeatedly advocated in messages and public addresses.——From time to time his determination not to accept a renomination has been asserted by persons representing him. At the end of the year, Secretary Taft announced his preference for judicial honors, but said that he would not decline a Presidential nomination, although he was inclined to think he would not be regarded as "available." Some have thought that the President would like to be a Senator from New York; Senator Platt's term and the President's will expire on the same day.——Mr. Bryan was received with highest honors when he returned, at the end of August, from his tour around the world, and he appears to be the leading, if not the only, candidate on the Democratic side. In his long address at Madison Square Garden, the passage exciting the most interest was that in which he advocated Government ownership of trunk railway lines and State ownership of local branches. But this policy is vigorously opposed by the leading Democrats of the South.——Several changes in the Cabinet have taken place, and others are near at hand. Attorney-General Moody on December 17th became a Justice of the Supreme Court. His successor is Secretary Bona-

parte, whose place at the head of the Navy Department is taken by Secretary Metcalf. The latter's successor as Secretary of Commerce and Labor is Oscar S. Straus, of New York, a Hebrew. Mr. Hitchcock will soon retire from the Interior Department. His successor will be James R. Garfield, now Commissioner of Corporations. Mr. Shaw will leave the Treasury Department on March 1st, and it is expected that Postmaster-General Cortelyou will succeed him there, while the Cabinet office thus vacated will be given to George Von L. Meyer.

The Year's Elections

At the elections of November 6th, the Republican party was sustained, but with some reduction of the extraordinary majorities of 1904. In the next House, its majority will be 58, instead of 114, but it will gain in the Senate, increasing the number of its representatives there to 61, while the number of Democrats will be only 29. Among the Republicans of the present House who were defeated are Mr. Wadsworth, of New York (because of his opposition to the Meat Inspection bill), and Mr. Babcock, of Wisconsin, who was for years the chairman of the Congressional Campaign Committee. The efforts of the Federation of Labor to prevent the re-election of members who had opposed the anti-injunction bill had but little effect. Speaker Cannon and Mr. Littlefield (at the Maine election in September) were prominent objects of the Federation's attacks, and their pluralities, partly for other reasons, were reduced. Mr. Hearst obtained the Democratic nomination for Governor of New York by an alliance with Mr. Murphy, the Tammany leader, whom he had been accustomed to denounce in his newspapers as a man who ought to be wearing prison stripes. Against this nomination there was a considerable revolt in the party. The Republican candidate was Mr. Hughes, widely known as the lawyer who, before the Armstrong committee, had exposed the offenses of the great life insurance companies' officers. His nomination had been supported by Mr. Roosevelt. Near the close of an exciting campaign, Secretary Root made, at Utica, a notable speech, in which, upon the President's authority, Mr. Hearst's newspapers were accused of promoting indirectly the assassination of McKinley. Mr. Hughes was elected by a plurality of 58,000, but the Democratic candidates for all the other State offices, including that of Lieutenant-Governor, were successful, together with the judges nominated by Mr. Hearst and Mr. Murphy in the city of New York.——In Massachusetts, District-Attorney Moran, regarded as representing the Hearst movement, was beaten; in Pennsylvania, and in Philadelphia, the Reform Fusionists were overcome; in Oregon (at an earlier election), a woman suffrage amendment was lost by a large majority, and Jonathan Bourne was nominated at the polls, for Senator. About one-third of the new Senators who will take their seats in March will have been elected by what is virtually a popular vote.

Legislation of Congress

Congress adjourned on June 30th, with a remarkable record of important legislation. Among the measures enacted were the Railroad Rate, Pure Food, Meat Inspection, Statehood, Denatured Alcohol and National Quarantine bills. As passed by the House, the Statehood bill admitted Oklahoma and Indian Territory as one State, and required Arizona and New Mexico to unite in the same manner. As finally past, however, the last two Territories were permitted to decide at the polls as to such a union, and in November Arizona voted against it, six to one. The Meat bill, suggested to the President by Upton Sinclair's novel, "The Jungle," and by the report of an investigation made by Commissioner Neill and James B. Reynolds, was passed quickly in the Senate, but the opposition of the packers' friends in the House caused the President to publish the memorable Neill-Reynolds report, which attracted attention all over the world. This was sufficient. Incidentally, some sharp letters past between the President and Mr. Wadsworth. The latter lost his seat at the November election. The tax on alcohol, denatured for use in manufactures and the arts, was removed. Quarantine was placed wholly under national control. It was decided that the Panama Canal should have locks.

Passage of the Railway Bill

The Railway Rate bill, passed in the House in February by a vote of 346 to 7, was the subject in the Senate of a memorable debate. No agreement could be reached in the Senate committee, and at last, upon Mr. Aldrich's motion, the House bill was reported by Mr. Tillman, a Democrat, and the bitter personal enemy of Mr. Roosevelt. While the long debate was in progress, legislation of this character was continually suggested by official and other reports concerning rebating and unjust manipulation of freight rates, by evidence as to railway monopolization of coal supplies, and by the prosecution and conviction of rebaters. There was little open opposition. Those who demanded provisions for broad judicial review of the Commission's rate orders at last consented to accept what was called the Allison amendment. The end of the debate was marked by bitter controversy over negotiations said to have been carried on by the President and Attorney-General Moody with Mr. Tillman and other Democrats thru the agency of ex-Senator William E. Chandler. Written statements were read and sharp speeches made, Mr. Tillman (virtually supported by Mr. Chandler) asserting that the President at a critical moment had deserted the Democrats with whom he was seeking an alliance. There was an issue of veracity between Mr. Chandler and the President. The bill was past on May 18th, by a vote of 71 to 3, and Mr. Tillman admitted that if it had not been for Mr. Roosevelt there would have been no such bill. The rate-making provisions of it had been opposed by the leading railway officers of the country. Important and radical amendments were added in the Senate, covering pipe lines, express companies, etc., and designed to prevent railways from owning coal mines. There has since been a voluntary reduction of rates. Some estimate at $50,000,000 to $100,000,000 a year the gain due to a discontinuance of rebating.

Prosecution of Railways and Trusts

Beginning in January with the indictment of the Burlington road, there was a remarkable list of prosecutions of railways and shippers for rebating. Nearly all of the leading railroad companies have been indicted more than once, and with them the Standard Oil Company, the Sugar Trust, the Beef Trust, and other combinations. Indictments of the Standard, found by Federal grand juries in several States, contain more than 9,000 counts, by reason of which, in case of conviction, it would be lawful to impose fines amounting to more than $180,000,000. A majority of these indictments were based upon information obtained by Commissioner Garfield, whose report concerning secret and open discrimination in rates for the benefit of the Standard was sent to Congress in May. Several railroad companies, and a few officers, have been found guilty and fined. In Kansas City, two freight brokers indicted for conspiracy (by direction of Attorney-General Moody) under an old statute (Section 5,440) which permits imprisonment, were sentenced to go to jail; but in New York a few weeks later, Judge Holt decided, in the cases of two indicted railway officers, that this old statute could not be so used against rebaters. A notable group of cases were tried before Judge Holt, among the defendants being the Sugar Trust, the New York Central, and other railroad companies. All were convicted, and in one month he imposed $312,000 in fines. The accused companies and officers were defended by Joseph H. Choate and Alton B. Parker. Under the Tillman-Gillespie resolution, passed in February, the Commission made investigation as to the relation of railways to the coal and grain trades, and the evidence thus obtained was the basis of many indictments for rebating and land frauds, one of the defendants being the Union Pacific road. Disclosures as to the acquisition of coal shares by Pennsylvania Railroad officers without paying for them excited much interest. In several States, laws reducing railway passenger rates have been passed or are proposed.——In November, at St. Louis, the Government brought suit under the Sherman act against John D. Rockefeller and his associates, the Standard Oil Company, and its seventy controlled corporations, for a dissolution of the combination. In a

State suit, the Standard had been convicted at Findlay, Ohio, but the judgment has recently been annulled because the proceedings were in the wrong court. Indictments returned to the right court are pending there. At the Findlay trial the use of a London holding company for one of the Standard corporations was revealed. At the trial of the Beef Trust, at Chicago, in March, Judge Humphrey discharged the sixteen indicted packers on the ground that they had gained immunity by giving information to Commissioner Garfield. For this he was criticised by the President. In the summer, the ice dealers and companies in many cities were indicted for unlawful combination, and several have been prosecuted to conviction.

Cuba's Revolution

The year in Cuba was uneventful until August 19th, when suddenly many prominent men of the Liberal party were arrested by the Government and placed in prison. Thus was ushered in the revolution which was soon to cause intervention. The presence of bands of armed revolutionists in the western provinces and not far from Havana became known, and these bands grew rapidly. This movement was a protest against the frauds and the intimidation by which the Government and its supporters had carried the elections of 1905. Realizing that he could not subdue the rebellion, President Palma (on September 8th) asked secretly for intervention and American ships. Four days later, he begged for 3,000 soldiers. On the 14th, Mr. Roosevelt sent Secretary Taft and Assistant Secretary Bacon to Havana, also publishing a letter giving the Cubans a friendly warning and defining his own attitude. After conferences and investigations which excited his disgust, Secretary Taft, on September 29th, established a provisional government, with himself at its head. President Palma had insisted upon resigning. The rebels gave up their arms, and the island was garrisoned by American troops. Judge Magoon has been Governor since October 9th. There was but little fighting before the arrival of Mr. Taft, and the island has since been peaceful. It is thought that new and honest elections may be held in June, but it is not yet clear that the Cubans will be able to govern themselves decently and justly.

The Panama Canal

Early in the year, the published criticisms of Poultney Bigelow drew long statements in reply from the President and Secretary Taft. Testimony was taken by the Senate Committee. THE INDEPENDENT sent two members of its editorial staff to the Isthmus, and their elaborate report began to appear on March 15th. Altho a majority of the Advisory Board of Engineers preferred a sea-level canal, the Commission approved the report of the minority in favor of a canal with locks, and was supported in this by the President, Secretary Taft and Chief Engineer Stevens. In June, a canal with locks was ordered, the vote being 110 to 36 in the House and 36 to 31 in the Senate. It was also ordered that supplies should be bought in the United States, unless the President should deem the prices extortionate or unreasonable. The eight-hour law, as affecting aliens employed, was repealed. It was decided to let out the work by contract, and to employ 2,500 Chinese, as an experiment, altho the labor unions protested against this. Mr. Roosevelt sailed for the Isthmus on October 9th, and spent three days in strenuous inspection along the canal route. His report was laid before Congress in December, in the form of a long and wholly optimistic message.

The Philippine Islands

Governor Wright was made Minister to Japan in January. His successor, Judge Ide, held the office until September 20th, when he retired, and General James F. Smith was inaugurated to serve in his place. Tonnage dues at Manila have been abolished, and the Commission has begun to establish postal savings banks in all the cities. Congress has deferred until 1909 the application of our coastwise navigation laws to traffic between the islands and the States. The bill reducing our tariff on Philippine sugar, tobacco and rice to one-quarter of

the Dingley rates, and placing other products on the free list, was passed in the House by a vote of 258 to 72, but was rejected by the Senate committee, which refused to permit even an adverse report. Bids for $12,000,000 worth of railroads in Panay, Negros and Cebu have been accepted, and a syndicate has undertaken to build 425 miles of road in Luzon. It has been decided at Rome that at least two-thirds of the $7,000,000 received for the friars' lands shall be expended in the islands. Aglipay was defeated in the courts, which ruled that the parish church property seized by him and his followers belonged to the Roman Catholic Church. In Samar and Leyte, the Pulajanes have been active. In their battles with the troops and constabulary there has been considerable loss of life on each side. The destruction of a band of Moro outlaws at Mt. Dajo, in March, excited discussion, owing to the killing of women and children, which appears to have been unavoidable.

Other Events

Owing to the limits of our space, only brief reference will be made to other events, some of which have recently been reported at length in this department of the magazine. Among these was the segregation of the ninety-three Japanese school children of San Francisco by the order of October 15th, and the President's dismissal in November, "without honor," of the negro soldiers of three companies in the regular army. We published last week long summaries of the messages and reports relating to these interesting questions. —— Thruout the year, there was a vigorous prosecution of land thieves. Of 490 indictments, eighty-nine were tried, with conviction in every case.——A great strike of the anthracite coal miners was threatened in April, mining having been suspended on the 2d, but after many conferences the men laid aside their demands and (on May 7th) consented to a signed agreement continuing the old conditions for three years.——Beginning in November, and due mainly to the higher cost of living, there was a general increase of wages on the railroads and in the cotton factories, mills, mines, etc., amounting to more than $100,000,000 a year.

Great Britain

In England as in France the difficulties incident to the separation of Church and State have been the center of political interest during the past year. The Liberal Ministry under Sir Campbell-Bannermann received an overwhelming vote in the elections, and all its measures have been stanchly supported by its large majority in the House of Commons, yet it has disappointed its adherents because so little has been practically accomplished toward carrying out its political program. It is able, however, to lay the blame for this to the determined opposition of the House of Lords to any radical legislation. A new factor in parliamentary politics has been the presence of a number of members representing the interests of the laboring classes, who, tho they are partly Socialists and partly trades-unionists, have formed under the leadership of Keir Hardie an independent group, like the Irish members, and have been able in several instances to dictate the actions of the Government. As the opposition of the non-conformists to the present Education Act was one of the main causes of the success of the Liberal party, a new Education Bill was brought forward early in the session by Augustine Birrell which provided that no money raised by public taxation should be used to pay for religious instruction, or should be expended on private or sectarian schools. The bill was admittedly a compromise measure and contained obvious anomalies, so it was sharply and logically attacked by extremists on both sides, but it was forced thru the House of Commons by the use of the closure after long discussion. In the House of Lords it was so extensively amended as to destroy the primal purpose of the bill, and on its return to the lower house the Commons refused to consider the amendments. In the meantime the situation had assumed a new phase by a decision of the Court of Appeals that the existing Educational Act does not require or authorize the school authorities to raise funds for religious instruction, and therefore the "passive resisters" were legally justified. The two Houses of Parliament also came into conflict in regard to other bills, most important of

which were the Land-Tenure Bill permitting tenants to raise such crops as they please on the land they lease, the Plural Voting Bill, which prohibits one man from voting in several different districts if he possesses property in them. and the Aliens Bill, prohibiting the importation of foreign labor as strike-breakers. All these were passed by the House of Commons and rejected by the House of Lords. A bill passed both houses reversing the Tatt Vale decision which made the funds of the labor unions liable for the illegal acts of the members. A plan was presented by Secretary of War Haldane to reduce the expenditure for military purposes without impairing the efficiency of the army. An appropriation of $1,000,000 was made for the unemployed and one of $22,500,000 to purchase land and build cottages for Irish crofters.

France

The year 1906 has been an eventful one for France, chiefly owing to the energy and determination of the Government, which has been successful in carrying thru several radical measures that a few years ago would have been regarded as impossible. Chief of these is the severance of the close relations that have existed between the Roman Catholic Church and France since the Middle Ages. On January 17th, Clément Armand Fallières, president of the Senate, was elected President of the republic to succeed M. Loubet. The Rouvier Ministry fell, chiefly on account of the disorders resulting from the attempt to inventory the Church property. The new Ministry was headed by M. Sarrien, but he was quite overshadowed by the dominant personality of M. Clemenceau as Minister of the Interior, who later became Premier. The Catholic bishops, now for the first time permitted to meet in freedom because of the revocation of the Concordat, decided by a majority of twenty-two votes that it was best to comply with the law, but the Pope disapproved of this compliance on the ground that placing an association composed chiefly of laymen in charge of the churches of a parish was a violation of the fundamental principle of the Church and undermined the rightful authority of the bishops and the Roman pontiff. The Government suggested as a compromise that the churches could remain open for worship under the law regulating public meetings in general, but the Pope refused to permit the necessary applications to be made to the local authorities for permission to hold services. The Protestants, Greek Catholics and Jews formed the lay public worship associations in accordance with the Separation Law, and accordingly will retain their property, but the Roman Catholics will forfeit church buildings and other ecclesiastical property to the amount of $250,000,000. After December 11th, the date when the law went into effect, the Government took possession of the episcopal palaces, parish houses, seminaries and other buildings thruout the country, and their occupants were evicted. The clergy will also be deprived of the pensions, amounting to some $8,000,000 a year, which the Government had granted in lieu of their former salaries, and the theological students will be compelled to perform military service like other young Frenchmen. The churches have not been closed, as it was realized by the Government that such action, tho legally justifiable, would arouse opposition too violent to be withstood. The elections of May 6th showed that the country in general approved of the radical policy of the Government. An explosion in a coal mine at Courrières, near Lens, in which over a thousand miners were killed, precipitated a dangerous strike, in which 46,000 men took part. Anarchists fomented the disorder until the whole Pas-de-Calais region was in a riotous state, but M. Clemenceau, by a mixture of firmness and tact, established order. The Dreyfus case was finally settled by the Court of Cassation, which declared him innocent of treason, and reported that the documents on which he had been convicted were either forgeries or irrelevant. Dreyfus was reinstated in the army, and Picquart, who had been dismissed from the army in disgrace for asserting his innocence, was made Minister of War in the Clemenceau Cabinet. Among the other acts of the Government must be mentioned the abolition of the guillotine, the reform of courts-martial, the purchase of the West-

ern railroad system, and the passage of a law providing that all employees in most industries and commercial establishments shall have one day of rest a week.

Russia

The end of the year finds the Russian autocracy more powerful and apparently more secure than the beginning. The long expected revolution is postponed to the indefinite future. During the year all known forms of opposition to an established government—parliamentary protest, passive resistance, industrial strikes, agrarian riots, military mutinies, territorial rebellion, financial embarrassment and political assassination—have been tried and have failed. At the beginning of 1906 it was commonly thought that the revolutionists had gained a foothold in the Caucasus and in the Baltic provinces, that the army and navy could not be relied upon by the Government, and that the Duma would inevitably become the controlling power in Russia. All these expectations have been disappointed. The incipient rebellions and mutinies were crushed out by the loyal troops, and the Duma was convoked and dismissed without having accomplished anything. In the elections for the Duma the Socialists and workingmen in general took no part, and in consequence the first Russian parliament was largely composed of the Constitutional Democrats, who were in favor of moderate and orderly reform. Their policy was, however, modified by the necessity of making concessions, for the sake of unity, to the peasant members, who insisted upon very radical measures, especially in regard to land. The Czar deprived the Duma of much of its power before its assembling by issuing a ukase retaining in his own hands the right to negotiate loans, to declare war, to make treaties, to control the army and navy, and to put cities and provinces under martial law. The Duma met May 10th and was received in state at the Winter Palace, listening in silence to a speech by the Emperor. The representatives of the people quickly responded with their demands, which included general amnesty for all political prisoners, the abolition of the death penalty, equal suffrage without distinction of sex, wealth, race or rank, the appropriation of the crown and Church lands for the peasants, the equality of all citizens before the law, and liberty of press, speech, meeting, association, strike, conscience and domicile. Some of these proposals were formulated into laws and past by the Duma, but were rejected by the Government. The only measure which became a law was an appropriation from the treasury for the relief of the famine sufferers. On July 21st the Emperor suddenly dismissed the Duma, with a reproof for their meddling with what did not concern them, instead of applying themselves to productive legislation. Most of the members of the Duma assembled immediately afterward in Viborg, Finland, and 213 of them signed an appeal to the people to support them by adopting a policy of passive resistance, refusing to pay taxes and to enter the army. This manifesto had little effect, since direct taxes are slight and the increase of drinking among the people brought additional revenue from the Government liquor shops. No revolutionary outbreak, except ineffectual mutinies in the fortresses of Sveaborg and Kronstadt, followed the dissolution of the Duma. The Government has since pursued a policy of stringent military repression. Mutinous soldiers and riotous peasants have been shot in squads. Opposition newspapers have been suppressed, and arbitrary arrests and banishment to Siberia have been more extensively resorted to than ever before. In retaliation the revolutionists have been active and often successful in throwing bombs and shooting at police officers and promiment members of the Government. During the year there have been massacres of the Jews at several places, notably at Bialystok and Siedlce.

Africa

The conference of the Powers assembled at Algeciras, Spain, January 16th to consider the condition of Morocco came to an agreement after two months and a half of discussion, in which the plans of Germany found little support except from Austria. According to the convention adopted, France is to be responsible for the maintenance of order in four of the ports and Spain in two, and the most

important ports, Tangier on the Mediterranean and Casablanca on the Atlantic, are to be policed by these Powers jointly under a neutral inspector. In the new Bank of Morocco each country is to have one share except France, which is to have three. Altho the convention is not yet ratified by several of the Powers, the increasing disorder in Morocco has forced France and Spain to begin their joint task, and a squadron of Spanish and French vessels is now at Tangier. The bandit Raisuli has more power than the Sultan, and his men even enter the market-place of Tangier to enforce his orders.——In Natal there was a native rising of some seriousness. Chief Bambaata and other Zulu tribesmen went on the warpath because of the imposition of new taxes, but after a month of fighting the revolt was ended by the killing of Bambaata and 3,500 of his followers.——The commission appointed by King Leopold to investigate the charges of abuse of the natives in the Kongo Free State confirmed in its report much of the reported cruelty and oppression, altho the testimony taken was not published. Great Britain has given a decided hint that an international conference will be called unless the conditions are remedied, and King Leopold has been sharply criticised in the Belgian Chamber of Deputies. He has recently sold to American and European capitalists extensive concessions of territory in the Kongo for the exploitation of rubber and other products.——A very liberal constitution has been granted to the Transvaal. Both English and Dutch are made official languages, and every white man is given a vote, regardless of race, the representation being distributed according to population. The British Ministry upon coming into power put a stop to the making of any further contracts for the importation of coolie labor for the Rand mines, and the 50,000 Chinese now there will be gradually sent back home.——In consequence of the revelations of graft by high officials in connection with the supplies for the troops in German Southwest Africa and of atrocities inflicted upon the natives by officers and soldiers, a joint attack was made in the Reichstag on the Government by the Catholic Center and Socialist Left, and Chancellor von Bülow was forced to dissolve the Reichstag and order new elections.

Other Foreign Events

China has entered upon the policy, so successfully pursued by Japan during the era of Meiji, of the gradual assimilation of foreign ideas and the modernization of government and society by internal forces. Upon the recommendations of the commissioners sent around the world last year and of the Chinese officials educated in Japan, America and Europe, many reforms have been introduced. A well drilled army has been created, the power of the viceroys curtailed, a cabinet of departmental ministers established, the postal and customs service taken under Chinese control, schools started, divination in the temples stopped, and opium is to be prohibited in ten years. The Russian and Japanese troops, except the railroad guards, have been withdrawn from Manchuria and that country opened for commerce.——Owing to pressure brought upon the Shah of Persia by the merchants and priests of Teheran he has called a national parliament and promised a constitution. The Shah is now dying, but the Crown Prince has agreed not to dismiss parliament for two years and to accept a constitutional government.——The tension between the Emperor-King and the leaders of the Magyar party in Hungary has been temporarily relieved by a compromise. The Magyar leaders have agreed to postpone the vexed questions of the language of military command and the customs between Austria and Hungary, and to form a Hungarian ministry under Dr. Wekerlé.——In Spain there have been a rapid succession of changes in the cabinet which has, however, continued to bring forward measures tending toward an eventual separation of Church and State. The laws legalizing civil marriage and restricting the friars aroused great antagonism in the clergy. King Alfonso was married on May 31st to the Princess Ena of Battenberg, with an elaborate ceremonial which was marred by an attempt by an anarchist to assassinate the royal pair by throwing a bomb at their carriage.

American Ships on the Pacific

BY JOHN D. SPRECKELS

[Mr. Spreckels is one of America's most eminent merchants and financiers. He is the founder of the J. D. Spreckels & Brothers Company, shipping and commission merchants, which owns a large fleet of tugs and trading vessels; is the president of the Oceanic Steamship Company, the Beaver Hill Coal Company, the Western Sugar Refining Company, and is the proprietor of the San Francisco *Call*.—EDITOR.]

THE possibility is suggested of a Congressional compromise on the Ship Subsidy bill which has just passed the Senate but is yet held up by the House Committee. It is asserted that this compromise may result in a new bill practically eliminating the Pacific mail lines, and I am asked to give my views as to the absolute needs of other transpacific lines than those which may run to the Philippines, which are excepted from the proposed elimination.

Briefly, the necessity is imperative that the mail routes in question receive Government protection and encouragement, if they are to continue to fly the American flag on the Pacific. I might speak in a general way, as an American citizen conversant with Pacific commerce, as a resident of the Pacific Coast jealous for its development, knowing the local benefits and the possibilities of trade to the whole country to be derived thru American shipping for American products, and the blow which it must inevitably be to our entire nation if our flag is forced from the Pacific trade—as it surely must be, as a simple business proposition, if obliged to comply with American laws and shipping conditions, which render the cost of operation very materially higher than is the case with the ships of any other nation, and left without Government aid to compete with these ships, all of which are heavily subsidized by their respective Governments.

I might, on purely patriotic grounds, refer to the disastrous effects if our products, our manufactures, mails and traveling public are to be left to depend —even in time of peace—entirely upon such service as foreign ships find it for their advantage to render. I might suggest the embarrassment to our nation in time of war and the fatal blow to our commerce if our flag is removed from this ocean and the supremacy of the Pacific, which she is so assiduously striving to obtain, is thus early and and easily surrendered to Japan.

But in so doing I might lay myself open to the charge of speaking with a double purpose or sinister motive, on account of my personal interest in the Oceanic Steamship Company, known, officially, as Ocean Mail Route No. 75. I will, therefore, take the bull by the horns and use this line as a single instance, giving as briefly as possible a few exact and significant details which will be more convincing of what I have already suggested than any general argument could be. I will confine myself to the potent facts in the story of this one line, running from San Francisco to Australia, via Honolulu, Pago Pago and New Zealand, with exact figures and careful comparisons, sufficient I am sure, to convince any thinking man—patriot, shipper or producer—that if there are benefits to be derived by our commerce or our country, thru an American merchant marine, such Pacific lines as the Oceanic have a more just claim for Government protection, stand in greater need of it and will return a better compensation than any other lines engaged in ocean traffic. It should also be borne in mind that the trade already gained by this line, thru a losing struggle of years,

is tangible and real—not the imaginary possibilities which may follow the opening of new lines—and is as well worth saving from surrender to some foreign nation as any new trade is worth achieving. I confine myself to this one line not because it stands alone but because concerning it I know every minute detail and can be frank to acknowledge its losses in exact figures which tell the whole story better than many words and place the proposition fairly and clearly before the mind of any practical business man.

Previous to the McKinley Administration the Oceanic Steamship Company was operating a line between the same points as at present, composed of two American steamships and one British ship, of a little over three thousand tons each, jointly making thirteen trips a year and receiving $135,000 per annum for carrying the American outward mails. The growth of commerce, competition and changing trade conditions rendered it necessary to increase the size and speed of these ships if the route was to be sustained. President McKinley and Postmaster-General Smith, recognizing the importance of maintaining the only direct mail route between the United States and the South Pacific British colonies, advertised under the law of March 3d, 1891, for a service to be performed by vessels of the second class (not less than 5,000 tons register), making seventeen trips per annum, time of voyage to be twenty-one days; these vessels to be constructed in America, capable of sixteen knots speed and to meet the requirements of auxiliary naval cruisers; the rate of compensation for such vessels, for mail carrying, to be not over $2 per mile for the outward trip.

The Oceanic Company was the only bidder, and entered upon a ten-year contract with the Government, immediately building three steamers, as required, of a little over six thousand tons each and of seventeen knots speed. It began the new service in 1901.

The schedule time requires an average speed thruout the voyage of fifteen knots. The distance in nautical measure is 7,210 miles. Most of the voyage lies thru the tropics. No other steamship line in the world performs such a fast service under similar conditions of climate and distance. The advantages gained by the public thru this transaction were three American steamships available as auxiliary cruisers, a reduction of time in the delivery of mails from twenty-four and three-quarters days to twenty-one days, an increase in the number of voyages per annum from thirteen to seventeen, with better facilities for transportation, an increase in the number of crew demanded, from 182 to 471, all, by law, required to be white, a certain percentage American citizens, all shipped in the United States, and eighteen American boys as cadets; resulting in an increase, in wages alone, of $144,120 per annum.

Each of the three steamships thus made available as auxiliary cruisers, built under Government inspection, is capable of mounting at least four six-inch guns and a large complement of smaller caliber, has a steaming radius without refueling of 8,250 statute miles at fifteen knots average speed—shorter distances at seventeen knots—and must always be maintained at the company's expense, at the highest rating known to maritime commerce.

All of this advantage to commerce and postal service, increase of naval strength and employment of American seamen costs the United States, annually, less to maintain than one man-of-war, of the type of the "Buffalo," and that without any consideration of interest, depreciation, insurance and taxes, borne by the company.

Years of actual operation have clearly demonstrated the inadequacy of the compensation already allowed, under the conditions of speed, frequency of voyage and size of vessels required on the Australian mail route. I believe that the figures will easily demonstrate this.

The Oceanic line must maintain its position against the operation of six important steamship companies, all heavily subsidized by their respective nations—England, Germany, France and Japan—in order to secure for these nations the valuable trade of the Australasian markets. England has the natural advantage that they are British colonies. The American Consul at Sydney, in his report of November 10th, 1904, says: "There is a strong sentiment favoring British goods, without regard to quality or price." Germany and France seek

by greatly overshadowing subsidies to enable their lines to divert the trade, while Japan is in the race more vigorously than all the rest, not only to secure the trade, regardless, but to establish herself in maritime supremacy on the Pacific. Incidentally, as the result of increased subsidies, German lines, a few months ago, began carrying freight from Europe to Australia for five shillings a ton. This indicates the appreciation of the German Government of the value of the Australasian trade.

Speed, frequency of voyage and type of vessel employed are all factors in this race, and we must meet a constant advancement along these lines to keep pace with the growth of commerce and competition. But in addition to this United States ships must meet by far the most stringent and exacting shipping laws, greatly increasing the burden and expense, on one hand, while it contends against heavily subsidized ships on the other hand, handicapping it beyond the possibility of sustaining itself in the unequal struggle. The Oceanic Line is hopelessly outclassed by these others, not only in the matter of subsidies, but also in the crews it must employ, in the wages it must pay, in the original cost of its vessels and in the cost of maintenance and operation; so that above the compensation for carrying the mails, under the contract I have mentioned, the average annual loss, on ocean mail route No. 75, has been just $373,349.02.

To make clear what I have said of the direct competition with which the Oceanic Line is brought in contact, as effected by subsidies, on one side, the accompanying table of lines, all having Australia as their terminal, will show something of the present inequality.

It will be seen by this table that the lowest subsidy paid is to the British Peninsular and Oriental Line—$313 per voyage less than the amount paid to the Oceanic Line; but the British line is allowed to carry Lascar crews, giving it overwhelming advantage in the matter of wages as well as in the cost of feeding the crew, and two knots an hour less speed is required of their vessels, while their original cost, to build, ton for ton, was 30 per cent. less than the American vessels. Allowing 20 per cent. for greater efficiency of American firemen, the wages paid by the Oceanic company still exceed those paid by the British company just $123,404 a year. The excess of speed required of the Oceanic Line means the additional consumption of over thirty tons of coal a day, which amounts to $97,996 a year, besides the loss of freight space required by the extra coal. The insurance, interest and depreciation on the extra cost of its vessels amounts to $123,690 a year to the American line. If the same scale of food were used on the American and on the British line the saving in the cost of feeding the men, alone, would amount to $32,217 per annum. So that the actual cost of operating the Oceanic Line exceeds the cost of operating the British line under precisely the same conditions, $447,567 a year. In other words, if the Oceanic steamships were British built and allowed the freedom of the British line it would cost $447,567 a year less to operate them.

As a business proposition it is necessary to success to run on a schedule of fifteen knots, so that so far as this comparison relates to a claim upon Government aid, the items bearing upon coal consumption should be eliminated, which would leave $285,311 as the actual difference in operating the line under American conditions as against British conditions—the actual handicap placed upon the line by American shipping requirements. And it must be borne in mind that these comparisons are based upon the conditions of the lowest subsidized of all the lines with which the Oceanic comes in competition. Any advantages which the line may have are represented in its gross income, and the disadvantages in its gross expenses. The annual deficiency of $373,349 tells the story and the comparison shows where it occurs. Ob-

Name.	Nation.	Speed.	Trips.	Subsidy.
Messageries Maritimes	French	14 knots	13 voyages	$621,587.00
North German Lloyd	German	13.5 knots	12 voyages	499,245.00
Peninsular and Oriental	British	13 knots	26 voyages	425,000.00
Orient	British	14 knots	26 vogages	600,000.00
Nippon Yusen Kaisha	Japanese	00 knots	12 voyages	263,000.00
Canadian-Australian	British	14 knots	12 voyages	330,000.00
Oceanic Steamship Company	American	15 knots	17 voyages	283,203.00

viously this must in some way be made good if the mail route is to exist as a distinct American service, for the Oceanic Line has staying qualities and has proven its ability to exist against odds, if any line could. Personally I cannot conceive of arguments which could justify encouraging new lines to South America and at the same time abandoning this established line to Australia.

In this latter connection there are doubtless very few who realize the difference in cost of operation which exists even in our own shipping between the Atlantic and Pacific. The experience of years confirms as a conservative estimate that there is a difference of over 30 per cent. in the price of wages and fuel, between the two oceans. I wish that I might emphasize this fact. If it were possible to apply the Atlantic Ocean rates of wages and price of fuel to the American steamships sailing out of San Francisco, the Oceanic Line would effect an annual saving of $249,883.

The Oceanic Line is obliged to pay the highest wages of any ocean steamship line in the world. Its ports of call bring it under the law which prevents its having Lascar crews. It employs all white men and besides carrying eighteen American cadets, required, and shipping its crews in the United States, in order to obtain the necessary percentage of American citizens for its crews, it is forced to rely upon union labor, pay union prices and practically hire none but union men. The total amount paid per annum in wages by the Oceanic Line, is $235,440. If the same crews were paid on the basis governing the Canadian-Australian Line, the total amount would be but $176,690. If they were paid on the basis of the Peninsular and Oriental Line, the amount would be only $123,404. If they were paid on the basis of wages on the Nippon Yusen Kaisha, the Japanese line, the total amount would be $97,708.

The importance to the United States of maintaining the present mail service is significantly expressed in the growth of our trade with British Australasia. From 1896 to 1900 our imports were $20,449,640. Our exports were $79,095,730. From 1900 to 1904, the four years following, our imports were $24,250,761, an increase of only $3,807,121, but our exports were $118,756,924, an increase of $39,661,194. It does not make the prospect of new trade with South America less alluring to protest, as an American citizen, that a trade like this is also worthy of consideration. Our exports to Australia compare well with others that we consider valuable markets. In the year ending June 30th, 1904, our exports to British Australasia were $27,343,741, to Cuba were $26,908,986, to Japan $24,955,032, to China, including Hong Kong, $28,864,035. Surely such a trade is worth conserving, especially when we consider that of them all it is yet in its infancy and that it has been wrested for America under difficulties which, if removed, leave promise of still greater increase.

The thread which binds this trade to the United States is the one direct mail service performed by the Oceanic Line at an annual loss of $373,349. This, to my mind—and I am sure without prejudice—constitutes as good a claim as could exist, for Government protection.

No market in the world can be won and retained without mail communication. It is the imperative need of commerce. It compels the nations, regardless of expense, to foster and expand their postal service. The better the facilities they provide the greater the expansion of their national industries. All nations transport their mails under their own flag if possible, and the constant effort, everywhere, is to secure the most rapid and frequent means of communication between cities, States or countries, because all the world recognizes that the approach to the market must be quick and convenient. Hence the imperative demand for fast and frequent passenger and mail steamers on all the ocean highways of the world—steamers flying the American flag if we would induce foreign capital to invest in the products of the United States.

I feel this as an American, not as a shipowner personally interested in any

The Oceanic S. S. "Sonoma"	6,253 tons, 157 men,	average wage $41.65
British S. S. "Orizaba"	6,300 tons, ———	average wage 17.00
Japanese, "America Maru"	6,307 tons, 180 men,	average wage 13.95

line; not even as a Californian jealous for the development of the Pacific Coast. For even if the portion allotted to the Oceanic Steamship Company in the original subsidy bill is finally credited to her, it will not make the line a paying investment. It will only enable it to continue the service which it has heretofore been rendering at such a loss as to make further efforts hopelessly unadvisable.

The foregoing is the best comment I can make upon the proposition that Atlantic lines to South America should be encouraged by subsidy, in the hope of building up a trade, while the Pacific, with such trade as I have indicated already established and a trade that is rapidly increasing, should be ignored and the position deliberately sacrificed and abandoned.

Wholly aside from its commercial value there are two reasons of national importance—grave and economical importance to the Government—why such a line as the Oceanic should be protected and sustained. It is the only means of regular communication with Tutuila, the insular possession of the United States, where the Government Naval Station of Pago Pago is established. This is the best port of the South Pacific Ocean, a highly strategic position of great value, nearer to Manila by 1,341 miles than by way of Honolulu and Guam. Oceanic steamships call there twice every three weeks, thus saving the Government the expense of a special service, which would be indispensable, as there is no cable or other means of communication.

The other reason is the naval auxiliary needs of the United States as taught us in the Spanish War, in the Russian-Japanese War, in the British South African War.

The three United States converted cruisers, "Buffalo," "Yankee" and "Prairie," of practically the same registered tonnage, of only 11,200 horsepower and fourteen knot speed, with an armament of twenty-two guns, from four to six inch and other of smaller caliber, cost the United States, in 1904, over $1,041,000 to maintain and keep in commission. The Oceanic fleet, "Sonoma," "Sierra" and "Ventura," built under Government specifications for speedy conversion into auxiliary cruisers for the navy, 22,500 horse-power, seventeen knots, capable of an armament of twelve six-inch guns, with a large complement of smaller caliber, cost the Government only $196,402.84, in 1904, by way of a mail contract. Is it not obviously cheaper for the Government to subsidize naval auxiliary cruisers which in time of peace are upbuilding commerce at private expense and anxiety, ready at short notice to respond to the demands of war, than itself to bear the entire cost of maintenance of an equal amount of tonnage of no practical service except in time of war?

Within the past few weeks imaginative Americans have talked of immediate war with Japan. It is not immediately possible, but every one knows that it is a remote contingency. Every one knows, too, that Japan, having already a steamship line from Yokohama to the Pacific Coast and from Yokohama to Australia, is anxious to complete a triangle, tending toward her ambition for Pacific supremacy, with a line from America to Australia.

Suppose that thru lack of protection to balance the imposed burdens the few American flags now flying on the Pacific are forced to surrender our commerce, mail and passenger traffic to the waiting Japanese, and then — suppose the war! Suppose it occurred before the Panama Canal was completed. It is not commerce and passenger traffic and mails alone which would suffer. Where would the United States find ships even to transport her soldiers and war material beyond the coast to all our unprotected new possessions? We had to charter and buy ships from everywhere on the Atlantic for the puny Spanish War, and even then we were very short. Ships are not so abundant on the Pacific, and would be very scarce if the war was with Japan.

To my mind it behooves us to make every effort to get more instead of abandoning what we have, looking at the matter from whatever point of view we may, and it is difficult to comprehend as statesmanlike the penny-wise and wasteful and sacrificial economy which objects to just protection enough to protect our merchant marine on the Pacific.

San Francisco, Cal.

Ferdinand Brunetière

BY THEODORE STANTON

[Mr. Stanton, during a long residence in France, has often met the late editor of the *Revue des Deux Mondes* and notes below some impressions of him.—EDITOR.]

THE late M. Ferdinand Brunetière was not a very sympathetic figure for progressive Americans. When he first began to be known in the field of letters, M. Brunetière was, if not exactly, a free-thinker, at least not the pronounced Catholic which he became in the closing years of his life. He was one of those unfortunate men who grow conservative as they grow older. In politics he was not a true republican and violently opposed all the efforts of the present régime to check clerical domination. During the Dreyfus incubus, he would not even keep still, but came out strongly, publicly and repeatedly on the side of "the army against the nation." He made the powerful *Revue des Deux Mondes*, of which he was the editor-in-chief for nearly fifteen years, the organ of all that was contrary to the doctrines of the Third Republic. Even on the question of militarism, war and arbitration, he sided openly with the old ideas. In a word, Ferdinand Brunetière was one of those brilliant, intellectual Frenchmen who prostituted great talents to the championing of a worn-out past.

In one respect only can Ferdinand Brunetière claim some attention from a periodical like THE INDEPENDENT. He was one of the first Frenchman to make a lecture tour in America and was the leader in time and talent of that now long and notable list of literary Frenchmen who have visited the United States, studied more or less superficially but in a friendly spirit our men and women, our customs and institutions, and then, having returned to France, have let no occasion pass of explaining to their fellow-countrymen the meaning and nature of American life and manners. Their explanations have not always been strictly exact and their bias has sometimes been too evident. But on the whole their intentions have been good and thus we have in Paris, "the heart of France and the head of Europe," as somebody has said, a galaxy of men and women writers who are more apt to praise than censure Americans and things American. They are the de Tocquevilles and the Michel Chevaliers of the twentieth century and their writings are not buried in stately volumes but are seen of all men in the daily press and magazines.

Ferdinand Brunetière led off in this group which now embraces, among others, M. René Doumic, M. Edouard Rod, Mme. Blanc, M. Mafilleau, M. Paul Adam, M. Gaston Deschamps, M. Yves Guyot, Pastor Wagner, the late Mme. Henry Gréville, M. Anatole Leroy-Beaulieu, M. Henry Bréal, Senator d'Estournelles de Constant, M. André Siegfried and Viscount d'Avenel. I know I am forgetting several names, but I have given a sufficient number to prove my statement that this body of men and women is both brilliant and numerous.

Ferdinand Brunetière's preachments concerning America, which he made public both by pen and word of mouth after his return to France, may be taken as a fair sample of what these Frenchmen think of us and what they say about us in Europe, tho his utterances were not always so laudatory as those of some other of his fellow countrymen in the foregoing list. He sometimes strained his facts to fit a favorite argument and more than once his assertions were quite wrong. But he never treated us flippantly. We had virtues which he extolled, and what he considered our shortcomings were pointed out mainly to correct a similar evil which he felt threatened his own land. He carried so far his good will toward us that more than one prominent American was invited to contribute to the *Revue des Deux Mondes*, and if few actually saw their articles in print the fault was not wholly that of the editor-in-chief.

Ferdinand Brunetière's most glaring mistake in his study of America was his oft-repeated assertion concerning the growth and influence of Catholicism in

the United States. This was due to three causes. In the first place, Brunetière became more pious as he grew old, as has already been said; in the second place, he was kept well in hand by the best Catholics when he visited this country. He would not see, because it did not square with the thesis of his declining years, that Protestantism and Liberalism, taken in the best sense of the term, are the ruling moral elements in the public and private life of this nation. He published stately essays in the *Revue des Deux Mondes* and he made clever speeches in halls and at banquets to prove all sorts of wonderful things from the tenet that the future of America lay in Catholicism. As he wrote well and spoke even better, this astounding assertion attracted wide attention thruout Europe, and more than once have I been asked by persons whose ideas count whether Brunetière's assertions were well founded.

Let me give one more example of Brunetière's proneness to present America to Europe. It happened in 1897, shortly after his return from the United States. The American University Club of Paris was giving a Washington's Birthday banquet, with the British Ambassador, Sir Edmund Monson, in the chair. M. Brunetière was the principal French guest. When the speaking began, Sir Edmund rose and, to the astonishment and delight of us all, delivered a carefully written eulogy of George Washington. The speech was so remarkable on account of the subject, the occasion and the personality of the speaker, that it created considerable comment both in Europe and America. John Hay, for instance, pronounced it "an event of no less than international impor-

FERDINAND BRUNETIERE.

tance," and the London *Times* published it in full and devoted a leader thereto. M. Brunetière quickly seized the full significance of such an address and with true journalistic instinct then and there asked for permission to give a French version of it in the *Revue des Deux Mondes,* and it accordingly appeared in extenso in the number for March 15th, 1897. The British Ambassador in Paris becoming for the nonce a contributor to the leading periodical of Continental Europe and his theme being the glorification of the first President of the United States, no French editor ever paid America and American institutions a higher compliment than when he thus threw open his pages to such a contribution from such a contributor.

I am even able to give M. Brunetière's own opinion of our national hero. It is contained in the following communication, to me apropos of this banquet, and is here made public for the first time. In May, 1897, M. Brunetière wrote as follows, in his peculiar chirography and in his idiosyncric style which reveals itself even in a translation:

"If one were to say of George Washington that, imbued with the sentiment of strict obedience to law, circumstances incarnated in him one of the greatest revolutions in history; that, tho he was one of the chief actors in founding 'the most modern' of the great nations, he had, nevertheless, 'the most antique' of souls; and, finally, that having possessed to a very eminent degree civil and military qualities of which ambition seemed to be the very reason and the spur—would not one be accused of trying to form his portrait from antitheses? But it would really be simply a proof that human logic is far from perfect and that there are in us more things than our psychology has defined, that there must be more opposites and contrasts than one is generally led to suppose in the make-up of the complex and harmonious unity of a great character."

And let me close these brief notes with a short description of the physical appearance of Ferdinand Brunetière. He was of medium hight, frail, and had a sallow, rather sickly, physiognomy. He wore eye-glasses and smoked cigarets incessantly. He was exceedingly polite in speech and manner. His conversation was easy, original and replete with unexpected phrases and words and refined, pointed humor was thickly scattered thru it. At the office of the *Revue des Deux Mondes* he received his visitors one at a time in his cozy sanctum, where he sat in a large chair behind a big desk. When the business talk was over, he would conduct you thru the adjoining ante-room, where other callers waited their turn, and he would not leave you till he had bowed you out at the farther door. Then he would walk back to his private office, looking neither to the right nor to the left, and recognizing no one, close the door behind him and ring for the attendant to introduce the next visitor. When the waiting-room was full, the last visitor might thus see the punctilious editor a half dozen or more times before he was finally ushered into his presence. This ceremony was due more to the reputation of the venerable periodical than to the character of its editor. But all this had an influence on the man, and if Ferdinand Brunetière, who, at the beginning of his literary career, seemed one of the coming men in modern French thought, but really disappeared out of tune with his times, this unfortunate literary and moral fiasco must be largely attributed to the deleterious influences emanating from the Rue de l'Université, where he passed most of his mature years, either as assistant editor or as editor-in-chief.

PARIS, FRANCE.

Intelligent Preparation for Public Service

BY ARTHUR TWINING HADLEY, LL.D.

[The following article contains the substance of a talk recently given before the members of the Yale City Government Club by President Hadley.—EDITOR.]

THE trouble with most schemes to prepare men for politics is that they do little but cram the student with facts about our political life and political machinery. These things are well enough in their way; but if anybody imagines that knowledge of facts will give him political efficiency he is greatly mistaken. He must know men rather than facts. He must know how to get at the real wishes and thoughts and feelings of those about him, so that they will see that he is a friend, and not a critic. Knowledge of facts about government is of as much use in teaching a man how to govern as knowledge of facts about poetry in teaching a man how to write poetry—and no more.

The most valuable preparation for political activity that you can make during the years of your student life is to get acquainted with as many kinds of men as possible. The boy who lives by himself in college is likely to be isolated thruout life. The boy who runs with a clique in college will probably remain his whole life long the representative of a clique. That boy, on the other hand, who learns while in college the wonderful interest of knowing and influencing different kinds of men may in after life become the representative and leader of the whole nation. Unless you care for other people you cannot know them. Unless you know them you cannot influence them. Unless you influence them you cannot lead them. I have in mind a college friend of my own who unconsciously prepared himself for large success, both at Yale and afterward, by the simple fact that he cared for so many kinds of men. There were others in his class who were more brilliant; there were others who were more tenacious of purpose; there were others who were more skilful in adapting means to ends. But there was no one else in the whole class whose welfare was a matter of concern to everybody as his was, for the simple reason that everybody else's welfare was a matter of concern to him.

For this sort of preparation for politics a college furnishes an unrivaled field. Nowhere will you have the chance to meet so many kinds of men and know them so intimately. He who utilizes this opportunity has learned thoroly the first lesson of politics. He who neglects it, no matter how many other things he may have learned, has missed that first lesson; and he will have to learn it for himself under much more difficult circumstances five or ten years hence.

Another line of preparatory work which I strongly recommend is the reading of history, and especially of American political history. The chief benefit which you will get from this is not the one which most men would suppose. It is not that you will learn facts about our government. Whatever facts of this sort you learn from books in college you will probably have to unlearn in after life, and substitute some other ones. It is that you get a background of large experience which will prevent your own little experience from occupying too much of the picture. The chief benefit derived from reading our history in times past is a certain quiet optimism which comes from contemplating the careers of men like Washington and Hamilton, Jackson and Calhoun, Webster and Lincoln. When we realize how great their difficulties seemed at the time, and yet how small they look today in comparison with the work that they did and the fame they achieved, we shall learn not to be daunted by little obstacles that look big, or upset by failures which, desperate tho they seem for the moment, may be turned into means of success if we only know how to do it. "To see a good in evil and a hope in ill success"—

this is the power which a man has acquired who has read history aright. If we have this sort of mental ballast of historical knowledge, every fact that we learn, whether from books or from experience, can be made to help us. If we have not this sort of mental ballast, the multiplicity of discouraging facts which we meet is liable to swamp us.

After leaving college the first thing which a man has to decide is whether he will go into politics directly, by identifying himself with a party and running for office, or whether he will be content to promote good government thru his indirect influence on legislation and other forms of public activity. Of course the two classes are not entirely separate. The man who has helped to draft laws and influence public opinion without the hope of office may suddenly find himself promoted to a high position in the public service at a time when he least expects it. But these cases are the exception, not the rule. The old-fashioned idea that a man could go into politics as an honorable amusement to occupy part of his time is not applicable to existing conditions.

To be able to go into politics professionally without the danger of sacrificing honor a man should have either independent means of his own or some calling like law or journalism upon which he can fall back if office can be had only at the sacrifice of principle. If he has such a second string to his bow he can be sure, and his friends can be sure, that in standing by a party when it does things of which he disapproves he is actuated by high motives of public service instead of low ones of personal livelihood. He should also be able to find a party with whose general aims and principles he is sufficiently in sympathy to enable him to work with it. For, as matters now stand, the machinery of party government is an exceedingly important thing in American politics. A man rarely gets office, and still more rarely keeps it, without the aid of this machinery. We may not like this fact; but a fact it is, and one which we are bound to recognize. Lincoln made use of party machinery. So did Webster. So did Calhoun. So has every statesman, however high his principles, from the time that American politics was organized.

If a man has not this natural affiliation with some one party and this independent means of livelihood, he is likely to do more public service by indirect influence on legislation than by direct participation in politics. If he can make it possible for others to give clean government, he can do quite as much for the country as if he were himself in public office as Governor. He can always find plenty of opportunity for this sort of political activity, whether he be rich or poor, partisan or independent.

The historic example of this kind of work is the civil service law, providing that tenure of administrative offices shall be based upon fitness and fidelity rather than upon party service. This was no political measure. The men who carried and enforced it, in its successive stages, were for the most part not actively engaged in public employment. Some were Republicans, some were Democrats, some were not identified with any party at all. Yet it would be hard to find men who did more public service than Eaton and Curtis and their associates in this movement, which strengthened the hands of every good man in political office and weakened the hands of every corrupt man.

Civil service reform is an accomplished fact. But there are other reforms equally important which yet remain to be carried out. The civil service law has put a stop to one particular form of corruption; but it remains for us to deal more fully with the sources of corruption, by laws which shall make it easier for the people to show what they want and to fix the responsibility for disregarding their wishes; which shall make it easier for men to govern in accordance with public demand instead of under the dictates of corrupt interests.

For instance, the separation of the dates of local and national elections ought to be more complete than it now is. When the two come at the same time a man lets his vote for mayor or councilman be influenced by his views on national politics; and a corrupt or misguided party leader may succeed in forcing upon the better class of voters a man whom they do not want, by persuading

them that his defeat will in some way interfere with the success of the national ticket of which they approve.

It is also important to separate the work of the State legislatures more clearly than we now do from the issues of national politics. It is for this reason that I favor the direct election of United States Senators by the people. It may be that the present system does not hurt the Senate, but it certainly hurts the State legislatures. If you send a man to the State capital, nominally to make the kind of local laws you need, but actually to elect a man to the United States Senate on national issues, you prevent an elector from voting for the legislator he wants unless that legislator happens to hold certain views about the tariff, and the currency, and some other things that have nothing at all to do with State laws. And you often make the legislator himself think that it is of very little consequence what kind of laws he makes, as long as he votes straight on a national party issue.

Another means of giving the voters power to express their opinion as to the kind of men they want in office would be furnished by what is known as a direct primary law. The old-fashioned system of caucuses gives every advantage to the professional politician in deciding who shall be nominated for office. A thousand men well organized can carry the primaries in the face of five times that number of public-spirited citizens without organization. It is the object of the direct primary law to give every member of a party a chance to vote on nominations, in the same way that every citizen afterward has a chance to express his choice between the nominees of different parties. A thoroly good direct primary law has not yet been worked out. This condition of things makes your opportunity and responsibility all the greater, for the matter is practically in your hands.

We also need a law which will fix more clearly than is now possible the responsibility of officials after they are elected for the good or bad conduct of public affairs. When the Constitution was framed our fathers were so fearful that the Executive would try to be king that they surrounded him with all kinds of checks and balances to prevent him from usurping power. In the few cases where a man is really trying to usurp power these constitutional checks are exceedingly good things; but in the ordinary, everyday running of a government, and particularly of a city government, they work rather badly. If a mayor is anxious to become a tyrant, it is a good thing to have a board of aldermen to stop him. But if he is trying to give the city a businesslike administration, a board of aldermen whose views are narrower than his may prevent him from doing it; and if he is trying to give the city a corrupt administration, the existence of such a board of aldermen may give him an excuse for saying that it is not his fault. The good man's hands are tied; the bad man is furnished with an apology for his misconduct. For thirty years we have been experimenting with city charters, to see if we could not locate power in responsible hands and hold the man responsible who had the power. Something has been done in this way. Much more remains to be done. The men who can devise the right kind of city charter will do an even greater and more difficult piece of public service than the men who established the principles of civil service reform twenty years ago.

One more word of advice and I am done. The man who would fully prepare himself for public service must not only do his duty in time of peace, but must be ready for the possible exigencies of war. The fact that for forty years we have not had a war which has seriously strained the powers of the nation should not blind us to the need of preparing to meet the dangers of international conflict from without and the still greater dangers of anarchy and lawlessness from within. If in the places where you settle there is any militia organization really worthy of the name, identify yourselves with it. If there is not, try to establish one. It may be that you will not be called upon for anything heroic in the way of military service. I certainly hope that you will not. But if you are ready to meet the danger in advance you will lessen the liability of its coming; and if it does come you will have prepared yourselves for the performance of the most vital of all public duties—the duty of protecting your country against imminent destruction.

New Haven, Conn.

On the Printing of Plays

BY CHARLES HENRY MELTZER

[Mr. Meltzer is one of America's most eminent critics and dramatists. His life has been spent in conducting dramatic departments in the great dailies, and translating, collaborating and writing plays. He is now assistant and secretary to Mr. Heinrich Conried, the Director of the Metropolitan Opera House. The following article is the first to be printed of which we are aware that describes the new literary movement of the printing and reading of plays.—EDITOR.]

IT is hard to write a play, harder to sell it, and still harder to get it produced. But till lately the most difficult task of all in the experience of the American playwright unwilling to spend money on the gratification of his literary or dramatic vanity was to find a publisher sufficiently daring, philanthropic and enlightened to print even a successful play.

For, like religion, the publishing trade has superstitions and traditions which it discards only with reluctance. And one of the most rooted superstitions of the American publisher bids him to shun modern plays.

CHARLES H. MELTZER.

The late T. Henry French might no doubt be quoted to the contrary. But the cheap yellow paper covers, and the cheaper printing which distinguished that gentleman's prompt books, could

only by courtesy be connected with publishing. The T. Henry French playbooks, indeed, were hardly known, save to the "profession," and had little (altho something) to do with the popularization or the perpetuation of the American playwright.

Out of the many comedies, farces, tragedies, dramas, farce comedies and melodramas which, somehow or other, found their way on to the boards, few were thought clever, pleasing or popular enough to be worth preserving. Once they had been performed they were allowed to perish, or were laid on the shelves of the managers, till, for lack of more immediately profitable and attractive works, they were revived. Thus the achievements of the playwright had, in a vast majority of cases, merely an ephemeral interest. They lived, as roses live, a few brief hours, and lapsed into oblivion.

What was the consequence?

Naturally, having no incentive to be literary, American writers for the stage neglected or insulted literature, until drama in this country came at last to be a thing apart, having virtually no relationship to art. Why should they waste effort in the polishing of periods? Why worry over delicacies of dialog which were never to take shape in printed books? Almost as much money might be made—nay, sometimes more—by inventing stage "business," injecting buffoonery into scenes, and thinking up "situations," comic or melodramatic, to delight the galleries. With the discarding of the old habit of printing plays, drama was inevitably divorced from literature. And the rupture profited neither the playwright, whom it tended to make sordid in his aims, nor the public, whose taste it gradually coarsened. So far removed from one another did the two component parts of all great plays appear fifteen or twenty years ago, both in England and in America, that only the most absolute optimist could have supposed it possible to bring them together again.

Then, however, Ibsen began to affect his English-speaking contemporaries, as he had already and far more deeply affected the German, Austrian and Italian dramatists. After reading Ibsen, of whose works Mr. William Archer, Mr. Gosse and others had given printed English versions to the world, men like Mr. Pinero, Mr. Henry Arthur Jones and Mr. George Bernard Shaw were smitten with the ambition to be published. Being all persistent and, I may add, importunate by nature, they succeeded before long (possibly at a personal sacrifice of a pecuniary kind) in getting some of their plays on sale, in the shape of books. But the public had lost, or had not acquired, the taste for reading stories told in the pithy and brief style, which, as we know, is essential to at least prose drama. The works of Mr. Pinero (just because they were really plays—not, perhaps of the highest order, but yet plays) caused no wonderful upheaval in the publishing business. Neither did the works of Mr. Jones (which were also, in their way, true plays) make much stir among the booksellers. Mr. Shaw, who could not be taken seriously as a dramatist, had, however, the good fortune—doubtless because his pretended plays were only half-plays—to find a market for his wares, tho they had literary merits of an unusual order. The appearance of his "Plays, Pleasant and Unpleasant," set some of the English publishers thinking, even if it converted none of them from their old, hostile attitude toward modern drama.

But a miracle was to be wrought among the distrustful Thomases of the book-printing community. And the magician who was to perform it was a poet who had been an actor and who chose to give expression to his thought in the form of drama. The literary excellence of Mr. Stephen Phillips's "Paolo and Francesca" shattered the resistance of the publishers. As edition after edition of that interesting tragedy was called for, ancient prejudices lost force, and were called in question even by hard-hearted, matter-of-fact persons to whom plays had been anathema. "Herod" succeeded "Paolo and Francesca" without injury to the new faith that had just vaguely dawned. Critics like Mr. Archer lent their enthusiasm to the support of the astonished publishing world. Mr. Beerbohm Tree did vastly more to bewilder them by actually pro-

ducing on the stage two works of Mr. Phillips which they had issued between book covers. The regeneration of the British drama had begun—modestly, maybe, but unmistakably.

It is well to guard against the too common tendency of men to confound *post hoc* with *propter hoc*. But who can doubt that the practice of printing plays (often before their performance) in France and Germany has lent dignity and literary significance to the drama of both those countries? Even in poverty-stricken Italy, where, except on "first nights," it is commonly found impossible to go to the expense of printing programs, the custom of publishing plays has been maintained. A few famous firms, like that of Treves, in Milan, make it a profitable business to issue all noteworthy comedies and dramas. Ask Mr. Heinemann, or Mr. Lane, of London, his opinion on the subject and he will tell you that—with rare exceptions—plays do not pay.

That in no case do they compare favorably, as investments, with novels, either here or elsewhere, seems sure. And, oh, the pity of it! For there is nothing more chastening to an author's conceit, nothing more calculated to correct bad taste, to disgust one with bad style, or to attract one to good drama, than reading plays. French plays, however trivial they may be, have almost invariably some virtue as contributions to literature. But dramatic literature, consisting as it does virtually of dialog, should not be weighed in the same scales as novels. Balzac could, with the most strict propriety, write book after book in his "Human Comedy" without dialog. While "Gyp" and Henri Lavedan need never, unless they choose, go to any pains in the matter of description. And yet, in varying degrees, all three may be accounted literary.

In attempting an estimate of drama, viewed as literature, it is essential to keep well in mind the claims and the necessity of characterization.

Dialog suggestive or descriptive of a character, however rude or coarse it may be, need never be excluded from literature. Fine words put into the mouths of boors or barbarians by playwrights have, on the other hand, no right whatever to respect either as literature or drama.

To illustrate the exact meaning of these last statements we make take "The Weavers" ("Die Waber") of Gerhart Hauptmann. Here we shall find a work written, from end to end, in the strange dialect of the poor, half-starved Silesian mechanics. And the effect is poignant, vivid, human, truthful—and therefore literary. As a contrast, take almost any "play" by a novice afflicted with a passion for blank verse, and you will see, in the place of reality, mock gentility, insincerity, unnaturalness, with which literature has always been at loggerheads.

He who would be literary in drama should study—not Addison, not Pope or Sir Thomas Browne, but Shakespeare, Congreve, Ibsen, or among more recent writers, Hauptmann, Porto - Riche, Pinero, Maurice Donnay, and—since the production of "The Great Divide" and "The New York Idea"—it may be added, Mr. Moody and Mr. Langdon Mitchell.

Let us hope, for the sake of the American stage, that the two plays last named will soon be printed and put on sale. They would be stimulating to many playwrights and of very considerable interest to the great reading public.

Perhaps, tho, in the case of the public generally, we should say "might be," rather than "would be"; for at present, having so rarely chances afforded them of reading decently written new plays, Americans have almost lost whatever taste they may have had for modern drama in book form. Sporadic efforts have been made during the past few years, indeed, by American publishers to find readers for plays from the pens of our own writers. Yet it is doubtful whether either the "Arizona" of Mr. Augustus Thomas, or the various comedies of Mr. Clyde Fitch, or the tragedies of Mr. Aldrich, which have been published here, have passed thru more than one edition. Indeed, if (without outraging modesty) the writer of this essay may say so, the one drama printed in English, and issued of late by an American publishing firm, which has enjoyed anything even vaguely comparable to the vogue of the "Plays, Pleasant

and Unpleasant" of Mr. Shaw, or the "Paolo and Francesca" and "Herod" of Mr. Phillips, has been "The Sunken Bell"*. And, as we know, that was originally written in German. The success of this work, as a book, has bewildered even the enterprising firm which published it. Almost without aid thru advertising, strange to say, it has sold steadily for the past six years, till now, after the appearance of a "sixth thousand," a seventh is likely to be called for.

One great advantage of the publication of plays that are really plays and really literature, is that they inevitably cause those works to be read publicly as well as privately, on the platform and in the study. "The Sunken Bell," like possibly other works with poetical pretensions, has even enjoyed the distinction of being recited and lectured about in churches. Thanks, in a great measure, to the popularity which it has thus acquired as a reading play, it has now, for the second time, found its way on to the boards, as part of the repertory of those favorite artists, Mr. E. H. Sothern and Miss Julia Marlowe. Had it not been read, it might long since have died utterly. Again, by holding its own between book covers, it has unquestionably fired more than a few enthusiasts with the ambition to emulate Gerhart Hauptmann, the admirable author who created it in the German. ("Die Versunkene Glocke.") That, on the whole, seems to the writer the most serious and important service it could render to our stage. Another, and a minor consequence, may have been the conversion of some stray manager from the imbecile heresy that denies the uses of literature in connection with the stage. This heresy, expressed blatantly and with shameless boasting by certain of the magnates who provide us with plays, has done much to belittle America in the eyes of foreigners.

The countries in which drama is, as a matter of course, regarded as fit to print, besides being fit to act, are the countries which stand in the van of theatrical progress. In France and Germany, in Italy and Norway, in Austria and Denmark, the publication of new plays quite usually either precedes or follows closely on the performance. Thereby the authors are supplied with a means of appealing from the perhaps mistaken verdict of their critics to the public, and so many a work which might otherwise have perished has been preserved to posterity. Some day, in the near future, we may be sure, America will have a dramatic literature worthy to be pitted against that of vastly older lands. And the coming of that day will be delayed or hastened according to whether plays find publishers here, or, as is now the custom, are only acted.

Poverello

BY EDWARD WILBUR MASON

"BLEST Francis, thou who art so true to me,
Give answer to thy mistress, Poverty:
What gifts or treasures shall thy soul reward,
Who labors in my name to serve the Lord?"

"Sweet Lady, grant me gift of loving words,
That I with manna may feed men and birds;
Let brute and human drawn around my knee
Be fed of kindness and tranquillity."

"But I have lovely riches all untold:
Shall I not grant thee joy like crown of gold,
And give thee for thy solemn robes of state
The wisdom and the learning of the great?"

"Nay, Lady, give me sorrow for all woe,
Give tears of pity from mine eyes to flow;
And give my soul for hidden raiment sweet
The wounds of God and His pierced hands and feet!"

CHICAGO, ILL.

For a National Investigation of Women

BY MARY E. McDOWELL

[Miss McDowell is the daughter of the famous General Irvin McDowell of the Civil War, and is now at the head of the university settlement maintained in "Packingtown" by the University of Chicago. She was recently voted the "second best woman in Chicago," by the friends of an enterprising Chicago daily paper. She is now engaged in pushing the bill before Congress described in the following article. We have read this bill and give it our hearty endorsement.—EDITOR.]

A BILL to authorize the Secretary of Commerce and Labor to investigate and report upon the industrial, social, moral, educational and physical condition of woman and child workers in the United States is now before Congress.

The working child has already won a public hearing, and has the sympathy of thinking people, but the working woman has yet to arrest attention; she is supposed to be able to look after herself. Society has not fully awakened to the fact that in protecting the women workers it is safeguarding its future generations.

Very little is known of the conditions under which the three million wage-earning women (mostly girls) are working and living. Nearly twenty years ago the Department of Labor made a very limited study of the working women in large cities. Since then we have had nothing but an enumeration of them and their occupations.

The last Census tells us that the proportion of women employed in manufactures is increasing more rapidly than men, that they are found in 295 of the 303 separate occupations, that they are not employed as soldiers, sailors, marines, street car drivers, firemen, or as apprentices to roofers, boiler makers or brass workers. For such facts we can properly look to the Census, but it is beyond the province of the Census to show what are the sanitary conditions of their employment—their hours of labor, what the effect of their work is upon the morals of young girls, upon the health of women, upon their homes, upon their children, upon the wage-earning power of their husbands, upon family desertion, upon the birth rate, and marriage rate. This investigation should be a sociological study, and will naturally be made by the Department of Labor.

Much confusion exists, and the whole subject is covered by a large interrogation mark.

The champions of the economic independence of woman welcome the "five million self-sustaining women" as pioneers of a better day for women and the home, while others prophesy disaster to that dearest of all American institutions. The increase of divorce, the lessening of the birth rate, the over-crowding of the labor market are a few of the evils laid at the door of the working women. These are some of the conclusions based upon insufficient data.

What we need is facts!

We need facts in order that justice may be done to the helpless women and girls who are inexperienced, unskilled competitors in an unwelcome labor market. The employer needs these facts to enable him to see his moral obligation to the women and children working for him.

As the average father is not quick to think of the relation of work or study to the health of his daughter of eighteen, neither has the average employer an intelligent view of the effect of night work,

or piece work upon the nervous organization of girls of eighteen, or women under twenty-four years.

The packer builds a "trimming room" where sunlight and air are shut out, where the walls run with ice-cold sweat, where the floor is covered with dampness and the temperature is 38 degrees Fahrenheit, colder than an ice box.

The room is constructed so as to "waste nothing." Is it true that nothing is wasted? Is it not quite possible that an investigation would disclose a wasted product which does not appear on the balance-sheet of the packer?

This packer will give money to help a girl who is stricken with tuberculosis, but sees no relation between her work and her health. Is there a relation? We want to know!

The films for our kodaks are made in utter darkness. The girls work nine hours under the rays of red lanterns. What is the effect upon their eyes and nerves? We do not know.

The legislators and the judiciary of our States need a body of facts to prove to them that conditions have changed since that day when "freedom of contract" meant liberty and equality to the individual; to show that a working girl is free to work all night, or seventy-eight hours a week, but is not free to protest, or to leave her job, when that job means food, clothing and shelter for herself and others. Keeping her job may mean keeping herself from worse than slavery.

We need facts, not merely to indicate the way we are tending socially, but as a basis for sane legislation in regard to woman's work. All States now prohibit her from working in mines. Ten States prohibit her from working in barrooms and concert halls; five from operating and cleaning dangerous machinery; five from night work; one protects her against the use by a boss of abusive or indecent language. In the past legislation has been meager and inadequate, but at present many States are agitating for protective legislation in the interest of women and children. Facts are needed to insure sane legislation in their interest.

This investigation must be national because manufacture and commerce are national. Competition between States makes it obligatory to provide a comparative study that will be as useful to one section as to another.

We hear of certain sections and certain trades where, as a superintendent said to me: "These people get along well—the husband and wife work together—they often own two houses. Oh! they don't have children, they leave that to other people!" Is this common in his trade in other sections?

We hear of certain employments that breed immorality; of others where the girls dip snuff, and others where they take too much alcoholic stimulants. We want to know why. Women are in this world of work to stay. Whether for weal or woe will depend largely upon our knowledge of the real conditions of their work and life. Only facts can clear the confusion that surrounds the subject at present.

However earnestly we may deplore the fact that women are in factories instead of homes, we must squarely face conditions as they exist. There are hundreds of thousands of helpless, untrained, unorganized women without the power of legislating for themselves, who are forced by stress of circumstances to earn their livelihood, and it is of vital importance that they be given the chance to be decently self-supporting under conditions which will not unfit them for wifehood and motherhood and the care of homes.

In the light of the few facts we now have we have a right to expect that Congress will vote an adequate appropriation to make an investigation that will be worthy of our nation and our need.

CHICAGO, ILL.

The Japanese Question From a Californian's Standpoint

BY JULIUS KAHN

[The Hon. Julius Kahn has lived in California since 1866, was educated in the San Francisco schools, has represented his district in the State Legislature and in the National House of Representatives during the Fifty-sixth, Fifty-seventh and Fifty-ninth Congresses and is reëlected for the Sixtieth Congress. No one was better able to understand the difficulties of the Japanese question when it suddenly became prominent.—EDITOR.]

CALIFORNIA is one of the garden-spots of the universe. No one who has ever visited that glorious State, which nature has endowed so bountifully, will attempt to contradict that assertion. She has been well christened "the land of sunshine, fruit and flowers." Her magnificent harbors, her fertile valleys, her boundless forests, her salubrious climate, and her marvelous, matchless scenery, have attracted immigrants from every quarter of the globe. Her population has been recruited from every State, from every land, from every clime. Her people have worked earnestly, loyally, unceasingly, to build up an

JULIUS KAHN.

American commonwealth on the distant shores of the Pacific, that should rank as one of the brightest gems in Columbia's diadem. But her people discovered, many years ago, that unless restrictive laws against the influx of Asiatic coolies should be enacted, our vaunted Caucasian civilization would receive, to say the least, a serious check in the upbuilding of that commonwealth.

Now any one who is at all familiar with the two races, realizes fully, and will state unhesitatingly, that Occidental and Oriental civilizations will never mix. And the people of California, after an experience of over half a century with Orientals, feel that they understand this Asiatic immigration question just a little better than many of their well-meaning countrymen who live about three thousand miles away from us, and who have beautiful theories on the subject, which, however, do not work out well in practice.

We first learned to know the Chinese coolie in the early fifties. He was brought to our shores, in those pioneer days, to work in our gold mines. That was only three or four years after the discovery of the yellow metal in this "New Eldorado" had been heralded to the world. He did not come, however, of his own volition, with the expectation of making his future home in California, as did most of the immigrants from other countries. He came under contract to one of six Chinese companies, and one of the conditions of that contract required his ultimate return, dead or alive, to his native land. He did not propose even to allow his bones to rest permanently in American soil.

He was a cheap workman, his wages averaging considerably lower than those of Caucasians employed in similar vocations. And because he was a cheap workman he was brought from China in increasing numbers as the years rolled on. Altho at first an unskilled laborer, he rapidly learned the manufacture of shoes, cigars, clothing, overalls, brooms, ladies' and children's underwear, and many other commodities of a similar character.

By 1870 there were fully 80,000 Chinese coolies in California. Few traveled beyond the borders of that State. The people of the East knew little or nothing about them, and yet, even at that early date, when a number of large manufacturers proposed to replace with Chinese coolies the white crispins of North Adams, Mass., a wave of protest swept across the entire country. Even the people of staid New England did not relish the idea of having her sober, industrious mechanics supplanted by the cheap and demoralizing coolie laborers of China.

But the yellow hordes kept pouring thru the Golden Gate in undiminished and ever increasing numbers. By 1878 California, "from Siskiyou to San Diego, from the Sierras to the Sea," as the people of that State express it, was ablaze with remonstrance. Just about that time the State Legislature submitted the question of the continuation of Chinese immigration to the voters, in order that the true sentiment of the population upon that subject might be made manifest to the rest of the Union. By the overwhelming vote of nearly 169,000 to about 600, as I remember the figures, the voters of California registered their opposition to the further influx of the Chinese coolie. It is customary, in some quarters, to sneer at the exclusion sentiment of California. That sentiment has been referred to, sarcastically, as "the utterance of the sand-lot." But the decisiveness of the vote is the best refutation of such assertions.

At the time this vote was taken we had learned to know the Chinese coolie thoroly. He was a canker in the heart of our civilization. He indulged in vices which were calculated to pollute our young men and women. That our estimate of him was correct has been amply corroborated recently, when, in a discussion in the British Parliament upon the report made by a Government official regarding the vices of the Chinese coolies working in the South African gold fields, it was shown that these vices were so horrible and revolting that the report was pronounced to be unprintable.

There is no denying the fact that he was a docile, untiring workman. As Kipling truly says, he seems to come into the world with "a devil-born capacity for doing more work than he ought." From daybreak to midnight, in season and out of season, weekdays and

HOW CALIFORNIA DEPENDS ON THE ORIENTALS TO RAISE CROPS. CHINESE AND JAPANESE LABORERS IN A VINEYARD.

Sundays, more like a machine than a human being, he toiled away in his stuffy quarters, where light and air were at a premium. As he worked for a mere pittance, he rapidly drove out the white mechanic from many fields of industry. Finally race riots occurred, and California appealed to Congress for relief. After several years of agitation laws excluding Chinese laborers from the United States were placed upon our statute books, and altho sporadic attempts have been made to modify or repeal those laws, they have remained practically intact up to the present day.

And now, once more California is threatened with an Oriental invasion. Since the great disaster which overwhelmed the city of San Francisco in April last, Japanese laborers to the number, practically, of 1,000 per month, have been swarming thru the Golden Gate; and I think that I am not stating the facts too strongly when I say that the people of California regard these Japanese coolies with greater abhorrence, aye, with greater fear, than they did the coolies from China. We feel that the former have all the vices of the Chinese, with few or none of their virtues. In business they are absolutely devoid of the stern sense of honor of the Chinaman. The latter invariably lives up to the letter of his obligation, while the Japanese never hesitates to break that obligation if it suits his purpose so to do. Why, even in Japan all the principal banks and commercial houses employ Chinese in the two important positions of compradore and shroff. The compradore is the purchasing and selling agent who acts as the go-between between his employer and the firms with which he does business. The shroff is the exchange expert, a necessary adjunct to all large business houses in a land where the value of silver, which is the common medium of exchange, fluctuates from hour to hour. As a rule foreign firms doing business in Japan place full reliance on the word of the Chinese compradore, even tho they have little

faith in the integrity of the Japanese proprietor. And if the bankers and business men are not to be relied on, what reliance is to be placed on the lower classes of Japanese society? But the people of California have never made objection to merchants, bankers and professional men from Japan. It is the coolie against whom they protest. And just one word in this connection. It has long been the policy of our Government to protect the products of our farms, our factories and our workshops from the products of the pauper labor of Japan and all other countries. Then why not protect the workman himself—the man who creates those products of our farms, our factories and our workshops, from that very pauper *laborer?*

Much has been said in recent discussions to the effect that the Japanese have been denied their treaty rights in California. The people of that State deny this assertion most emphatically. But in speaking of treaty rights, Californians freely express the belief that the existing treaty, under which Japanese coolies come to our shores at the present rate of 1,000 per month, is not an altogether equitable instrument. They contend, on the contrary, that the treaty is altogether one-sided. True, it guarantees to the citizens of either country full right of entrance into and residence in the territory of the other. But who ever heard of American laborers, or American mechanics, going to Japan in large numbers? Why, industrial conditions in the "Land of the Rising Sun" are absolutely prohibitive, so far as the emigration of the American workman to that country is concerned. The latter receives from two dollars and fifty cents to seven dollars a day in his own land. It would be an insult to his intelligence to assume that he would want to sail to far-off Nippon for the privilege of working there at the prevailing rate of wages paid to mechanics, to wit, thirty, forty, fifty or sixty cents a day. It is the high wage that prevails here that is attracting thousands of the little

CALIFORNIA RANCH ON WHICH CHINESE AND JAPANESE ARE THE ONLY FARM HANDS GATHERING A CROP OF BEANS.

brown men to our shores. Unless prohibited by legislation they will come in still greater number, while the number of Americans who expatriate themselves in Japan, by reason of the conditions that prevail there, must, necessarily, always remain limited. And for these reasons Californians feel that the treaty with Japan is entirely one-sided.

But the Japanese coolie who comes to California, for the most part, is not an unskilled laborer. He is a cobbler, tailor, gardener, cook, waiter, or one or other of a dozen classes of workman, as the case may be. He can, and does, live just as cheaply as the Chinaman. A handful of rice, a little dried fish, and a cup of tea make a square meal for him. And we feel convinced that if he be allowed to come to these shores in undiminished numbers, he will ultimately drive out all Caucasian competition in every occupation which he enters, just as the Chinese coolie did a quarter of a century ago. He has already driven the cherry orchardist out of the productive Vaca Valley, about sixty miles north of San Francisco. But it is in the latter city that he is the greatest menace. To speak specifically, let us take the case of a cobbler. He has learned his trade in his own country. He has scarcely set foot in that city, when he rents a dingy little room in close proximity to a white shoemaker who has been established in that location for many years. Then the little brown man puts up his sign and announces his scale of prices. A perusal of the latter shows that he asks about one-half the amount charged by his white neighbor for similar work. Gradually his business increases, while that of his white neighbor diminishes. The white man, with a white man's habit of living, trying to bring up his little family decently and honestly, trying, if you please, to give his children the benefit of a good education, finds that he has been brought face to face with an

STRAWBERRY PATCH AND PEACH TREES IN WENATCHEE VALLEY, WASHINGTON, 1905. FRUIT RANCH EMPLOYING JAPANESE LABOR.

alien competitor whose material wants are few, and who can subsist on fare on which a Caucasian would starve. He tries to stand it for a little while, but sooner or later, when he sees the blanched faces of his little ones, when he begins to realize that he cannot provide for them as has been his wont, the iron enters his soul. He begins to understand that this unequal competition means that he must come down to the Japanese's standard of living, or he must quit the neighborhood in which he has been established these many years, to begin anew the struggle for existence in some other section which the little brown man has not, as yet, invaded. I have not overdrawn the picture. It has its counterpart in practically every street in San Francisco. It is such conditions that ultimately lead to bloodshed and race riot. We want, by all means, to avoid anything of that kind. We are peaceable, law-abiding citizens, but we want the Japanese coolie kept out of our State. Nor do we think we are unreasonable in our demand. If similar conditions confronted the citizens of Massachusetts we feel confident that they, too, would feel as we do. The Japanese in his native land is a great fisherman. Suppose ten thousand of these Japanese fishermen should settle near Gloucester and embark in the cod-fishing industry. Would the Gloucester fishermen stand it with equanimity, or would they, like their brethren in California, raise their voices in indignant protest? And so with every other community, and every other class of workingmen.

Since the disastrous conflagration of last April the situation has been intensified by the manner in which many white tenants were practically evicted from their homes by Japanese. The latter elected to establish themselves in one of the most desirable residence sections of San Francisco. They would offer the landlords of property twice and thrice the amounts that were being paid by white tenants, and after the latter had been dispossessed, would open Japanese boarding houses with swarms of occupants, in these desirable residences. When the white man saw that he was being ousted to make way for the Oriental it did not serve to establish a more cordial relationship between the races. One must also bear in mind that at this time, by reason of the conflagration, houses for rent were exceedingly scarce, and many of the families thus dispossessed had to seek homes on the other side of the Bay of San Francisco.

And then came the incident of the public schools. Many parents had objected to having their little ones seated with adult Japanese. The frequency of these complaints finally caused the Board of Education to segregate all Japanese scholars from the white children. It may be well to emphasize the fact that the Japanese were never denied the privileges of free education. They were merely ordered to attend the Oriental school, which has been in existence for many years, and which had been established for, and was freely attended by, the children of Chinese parents. In so doing the Board of Education did not feel that they were violating any of the treaty rights of the Japanese, and they do not now feel that any of those rights have been violated. And the sentiment of the entire State is behind the Board of Education; and this sentiment is backed up by the opinions of some of our most eminent jurists as to the legality of the Board's contention. I feel confident that Californians will never permit their young children to be thrown into close contact with adult Japanese.

In this very connection it is well to bear in mind that the maturity of males and females in Japan is far earlier than with the Occidental. Besides, the relationship between the sexes is entirely different. The old marital law of Japan determined that "the association in life of man and woman is a fundamental law of human society. Whoever has passed his *sixteenth* year should no longer live in isolation, but select a bride-wooer, and thru this means contract a matrimonial union." They have legalized relationships between the sexes, which, according to our standards, are positively immoral. The people of California understand this matter fully. Mawkish sentimentality and even threats of military interference will make them all the more steadfast in their purpose. While some of the fruit-growers of our State may be opposed to the exclusion of Japanese coolies, they

will all be found in thoro accord with the efforts of our Board of Education to segregate the children of Caucasian parents from Japanese students. Nor will there be a war as the result of the action of the San Francisco authorities. The sober, good sense of both countries will prevail in the matter. Japan does not want war any more than we do. Indeed, it will take her some years to recover from the effects of her recent conflict with Russia. The fact that she finally failed to receive a money indemnity was a source of sore disappointment to her people, and they rather hold us Americans responsible for their failure in that direction. If the reports of the newspapers of about a year ago are to be credited, some prominent Americans received rather harsh treatment at the hands of the anti-American mobs at Tokyo, shortly after the conclusion of the treaty of peace at Portsmouth.

I am positive that I voice the unanimous sentiment of California when I say that we do not want our naturalization laws extended to the Japanese. Those laws at present apply only to whites and alien Africans, or aliens of African descent. Several efforts have heretofore been made to amend these laws. On July 4th, 1870, a memorable debate took place in the Senate of the United States over an amendment to strike out the word "white" wherever it occurs in those laws. That amendment had been offered by Senator Charles Sumner, of Massachusetts. The question of naturalizing Asiatics was fully discussed in that debate. Many of the Senators who spoke and voted upon that amendment had led the vanguard in the fight for the enfranchisement of the African freedmen, but a goodly number of these drew the line at Asiatics, and the amendment was finally defeated by a vote of 27 to 12. And Californians see no reason why our Government should change its attitude upon this question at this time. We who have learned to know the little brown man, by reason of our close association with him, have no faith in his professions of loyalty to any country but his own. We feel that even tho he might go into our courts and forswear allegiance to the Mikado, if ever the time should come when there might be a struggle between our country and his native land, his sympathies, his influence and his actual support would go to that native land. He does not recognize the binding force of our oaths. All men who have had dealings with him will testify to that. And so the mere formality of having taken an oath of allegiance to the United States would not be considered by him as binding upon himself in an emergency of that kind.

There can be no gainsaying the fact that he is intensely patriotic and devoted to his Island Empire. All Americans admire him for that devotion. We remember that during the war with Russia hundreds of Japanese left this country to enter the ranks of the Mikado's army. Thousands of others sent their mite to the Imperial Treasurer to help defray the expenses of that war. We saw innumerable instances of his patriotism, and we sincerely admired him for it. But the people of California, after having had him among them for many

POTATO FIELD WITH CORN.

years, feel satisfied that he will always remain loyal to the Mikado, and that the oath of naturalization would be to him but a hollow mockery, an empty formality signifying nothing. We do not want that kind of citizenship, and we do not intend to have it, if we can prevent it.

Just a few words in conclusion. There is no use in losing one's temper over this Japanese question. We can still discuss it calmly and dispassionately. It will be the part of wisdom to study it, not alone in the light of the present, but also in the light of the future. Today, both the people of the United States and the people of Japan are engaged in a friendly struggle for the commerce of the Pacific. With the passing years this competition will grow more keen, the possibility of friction will become more and more probable. There are still some things that the world is not willing to submit to arbitration. History has taught us, too, that most of the world's great wars have arisen out of greed for commercial supremacy, or greed for territorial expansion. He will rank as a wise, far-sighted statesman who will constantly, from this time forward, remind his countrymen that we should, "in time of peace prepare for war."

WASHINGTON, D. C.

The Filipino Gospel

BY DAVID J. DOHERTY, M.D.

THE Independent Filipino Church has distributed advance sheets of its "Oficio divino" which is to contain two parts: First, "El Novisimo Evangelio" (the latest gospel), and second, "El Culto Eucaristico" (the Eucharistic ceremony). The thirty-two pages which have appeared contain the approbation of Archbishop Aglipay and his episcopal counsellors, the preface, and twenty-six paragraphs of the Filipino Gospel. The book is announced as "the property of the editor, Isabelo de los Reyes," a well known political agitator of the islands who is now in Barcelona, Spain.

The approbation of Archbishop Aglipay is as follows:

"Inasmuch as the Venerable Supreme Council of our Bishops has approved and we have sanctioned this divine office of the Independent Filipino Church, we strictly ordain upon our virtuous priests its faithful observance and its early translation by them into the dialect of each locality, so that the public may hear it and may understand the purity of our doctrines (as the Apostles commanded, I Corinthians, 14) and particularly the Gospel. And instead of the imaginary lives of the Saints of the Breviary, they shall read in the evening the entire Gospel of the day, meditating one by one and striving to put in practice the heavenly teachings of the Divine Master which it contains."

The title to the preface runs:

"The Unified Gospel carefully expurgated from heresies and other interpolations and amplified from the writings of Moses, the Prophets and the Apostles."

It gravely announces:

"We have not spared time nor patience in resorting to the best libraries of Europe, nor money in purchasing the hundreds of works of all schools and sects, ancient and modern, that we have deemed it necessary to consult in our most delicate undertaking of preparing the best possible gospel for the Independent Filipino Church."

It enters upon a lengthy discussion of the gospels, the occurrence of miracles, the existence of a devil, etc., etc. The names and the arguments of Baur, Strauss, Renan, Eichhorn, Voltaire are freely used, and the conclusions reached are for the most part in accord with those of these writers. Yet the bishops deny that they follow Renan, Strauss and the others, because they accept the Divinity of Christ.

"Neither the Evangelists nor the Apostles were infallible," and the gospels are later records of early traditions of the Master's words, and hence the errors, contradictions, interpolations, alleged miracles, etc., which disfigure them. The exegetical skill of Mr. de los Reyes has separated the wheat from the chaff, and he presents us the pure and undefiled word in this Filipino Gospel.

He frankly states that "the Protestant principle of blind faith" is inadmissible, and that it has been the cause of "the

frightful absurdities and the wild imaginations which Protestants and Romanists resort to when they defend a manifest error or a biblical contradiction."

into readings for each day, each reading terminating in an explanatory homily. There are elaborate footnotes, justifying every text. The pages thus far issued

ARCHBISHOP AGLIPAY.

The preface concludes with the statement:

"With the help of God, the Independent Filipino Church attempts that which has hitherto not been done either in Europe, in America, or in any other region; that is, the *recasting* of the authentic portions of the four Gospels into a uniform and complete whole which contains the true life and doctrine of our Lord Jesus Christ and which is purified from ingraftings and from contradictions, both with themselves and with the Old Testament."

The text proper consists of biblical texts from both Testaments arranged according to the historical sequence of events in Christ's life. They are grouped

refer to the Messiahship, the unity of God (the Trinity is rejected as a dream of the Platonists), the incarnation of the one God from a virgin, the birth of the Messiah, the youth and baptism of Jesus, the temptation (the tempter is said to have been one of the Roman soldiers), and the Sermon on the Mount.

The readers of THE INDEPENDENT will, I fear, be slow to believe that such a preposterous book could be issued by a body of men claiming to be a Christian church. But we who know Isabelo de los Reyes are only amazed at his audacity and vagaries.

MANILA, PHILIPPINE ISLANDS.

A Plea for the Forest Reserves

BY THOMAS ELMER WILL

Secretary of the American Forestry Association.

LET us look at a picture.

Yonder is a mountain. Beginning at its base and stretching upward and away toward its summit is a noble forest. Trees of all ages, from the tiny shoot to the mighty monarch, survivor of a thousand storms, associate in fellowship. The larger ones commingle their branches and leaves and, save for an occasional opening to the sky, form, thus, a dense canopy known as the "forest cover."

This forest is treated not as a flower to be plucked, a mine to be exploited, or an enemy to be destroyed, but as a treasure to be guarded, a crop to be cultivated, cared for, and judiciously harvested. "Weed trees," species unworthy of valuable space and cumbering the ground, are cut away. Damaged trees are removed. "Seed trees," properly distributed and destined to become the parents of future generations of trees, are carefully preserved, that the forest fail not.

Moreover, the cutting is intelligently done; stumps are left low; the trees are so felled as to sustain the minimum of damage for themselves, and to occasion as little is possible to their neighbors, and especially to the younger growth, so easily crushed and destroyed by the processes of lumbering.

Care is taken that no desirable logs are left to rot on the ground, and that no

THE BARREN EAST SIDE OF WEST SUGAR LOAF MOUNTAIN.
Once covered by forests. Trees up to twelve inches diameter. Very badly eroded. White Mountains, New Hampshire.

THE RUINS OF A BRICK HOUSE DEMOLISHED BY THE FRESHET OF MAY 21, 1901, AT BAKERSVILLE, MITCHELL COUNTY, N. C.

serviceable sticks in branches and tops are overlooked. Tops, instead of being left reared high on branches to dry and form a timber bed for future conflagrations, are so trimmed that they will lie flat on the ground and quickly rot; or they are piled and burned.

Spread deep over the floor of such a forest lies a mass of vegetable wreckage; tops, branches, leaves, and decaying trunks, forming, together, a forest mulch —at once a carpet and a soil. Thru this, where light permits, minor vegetation thrusts its head, and thruout its breadth and depth there ramify the roots of ten thousand trees and shrubs, seeking standing room and food.

Now the clouds gather and the storm bursts; but the thickly falling drops are caught in the forest cover. Their force is broken by the leaves and branches, and they fall lightly to the ground. Here, as by a sponge, they are absorbed by the forest mulch. A portion of this water is taken up and utilized by the vegetation. The bulk of it, however, gradually finds its way thru the mulch into the earth. This the forest has prepared for its reception. Protected, constantly, by a dense, moist blanket, this forest soil is always humid and porous. Further, it is shot thru and thru with tree roots. Many of these are living; and downward, along their sides, the water finds its way. Others have died and decayed, leaving open channels where they grew. In either case, the unutilized water readily descends and enters the underground circulation. Gravity carries it slowly to the base of the mountain, whence it emerges thru a thousand crystal, bubbling springs. From these, it enters the visible circulatory system; passing, first, thru rivulets and rills and then creeks and rivers, in time to find its way into the all-receiving sea.

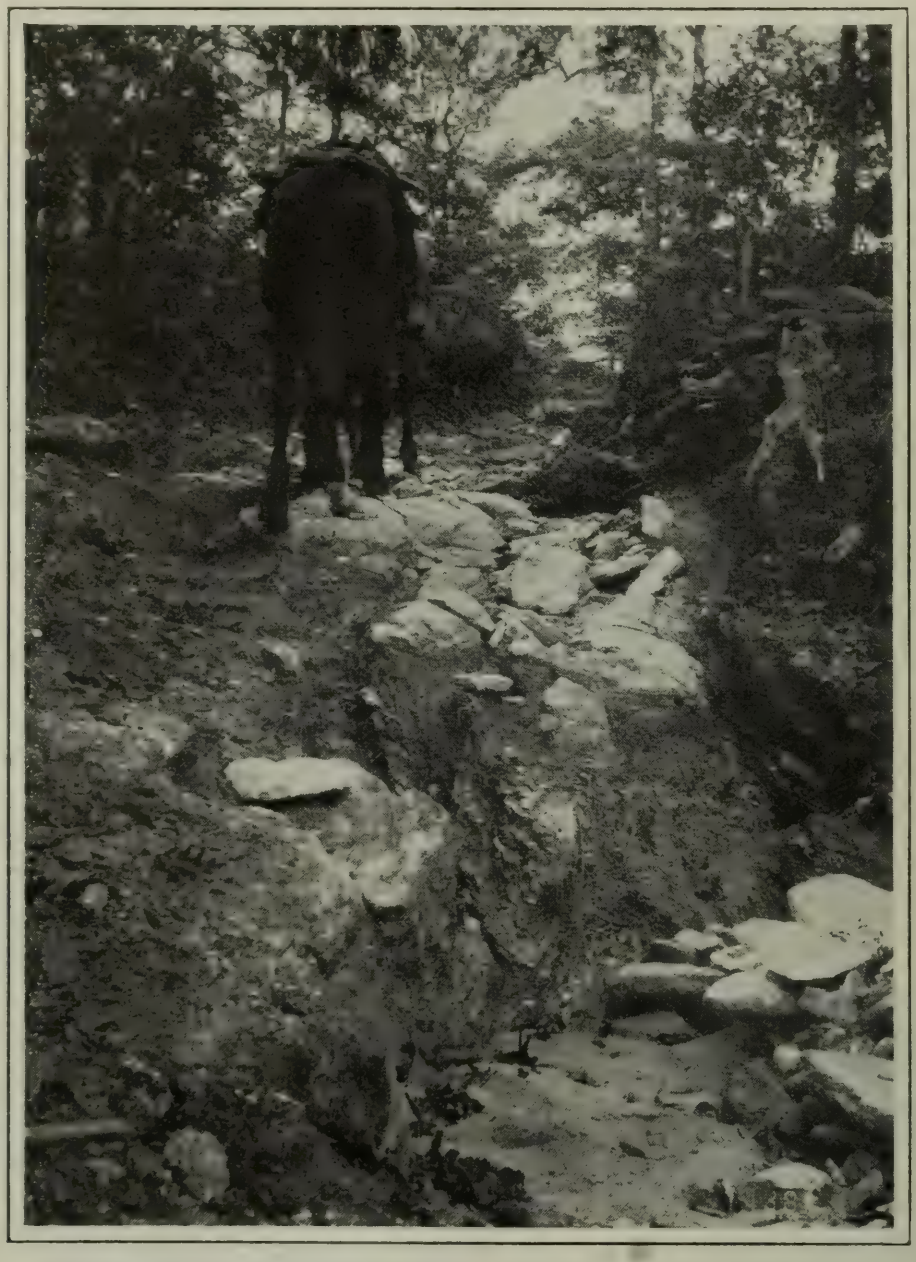
Rivers thus fed maintain, year in and year out, a substantially equal volume.

The hills and valleys to which they are tributary are watered; falls, from which, directly or thru the conversion of water power into electric power, mills are driven, can be relied upon the year round, and the channels of the rivers, and the beds of the harbors into which the rivers empty, are kept open and clean, that these waters may bear upon their bosoms the commerce thru which, largely, the wants of man are supplied.

Such is the forest administered according to the principles of forestry, and such are the beneficent results. Let us look, now, upon another picture; that, alas! with which we are all too familiar.

On the opposite side of the mountain is another forest, equally endowed by nature. Here, however, man, unrestrained by thought of consequences or by dread of law, has been left to work his will. That he may cultivate soils never intended for agriculture, the small farmer clears space after space up the mountain side. In a brief period, say from five years or twenty, these clearings, under shiftless and unscientific cultivation, have become worthless and are abandoned. Other vast areas are invaded by the lumber companies. Instead of treating the forest as a crop, to be harvested judiciously and in perpetuity, they attack it as the buffalo were attacked in the seventies, taking all they can use—regardless of the future, and destroying most of the remainder. Some, as the pulp men, leave nothing.

Thickly scattered over the area thus denuded, and in inextricable confusion, lie, as they fell, dense masses of branches and tops. In these fire, when not purposely kindled, soon catches by chance. Like a besom of destruction, it sweeps up the mountain side. What might have been a second growth disappears. With it also goes, often, even the possibility of a subsequent growth; for the former soil, composed largely of vegetable mold, is devoured by the flames. Stretching, now, from mountain base to timber line,



WRECK OF RAILROAD BRIDGE BY FLOOD OF MAY, 1901. WATER WASHED THRU TUNNELS OVER THIRTY FEET ABOVE BED OF STREAM. HAMPTON, TENN.

is a vista of blackened stumps and bald, bleak, protruding rocks.

Now, again, the rain falls. This time there is no forest cover to break its force; no forest mulch to seize and pass it slowly to underground circulation. Instead, it sweeps down the mountain side, carrying before it silt, sand, stumps, boulders, wreckage—everything movable. These, it dumps into river beds and harbors.

Now, for the two-fold reason that their waters enter them in torrents, and that their channels have been largely filled, the rivers overflow. Fruitful fields are denuded of their soils or buried beneath drift and sand. Houses, factories, railroads, bridges, even villages, are swept away. The utility of water powers is greatly diminished or destroyed, and commerce, likewise, is grievously obstructed.

The second picture is, notably, that of the Southern Appalachian Mountain region. Here lies a narrow strip of mountain land including portions of Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama and Tennessee. From a timber standpoint, this strip is of far-reaching importance. It contains our last remaining, important stand of hard woods. Here the ax of the exploiter has, till recent years, delayed to enter. Here, again, rise all the important rivers which water the area south of the Ohio and Potomac and east of the Mississippi. These rivers furnish the

WHITE WATER ROAD (EROSION), TRANSYLVANIA COUNTY, N. C.

Piedmont region with water powers, now developed and being developed, aggregating 500,000 horse power.

But the work of desolation and devastation is on, and the woods are melting like frost from a window pane. Streams and harbors are filling, greatly to the detriment of commerce. Floods are doing their deadly work, those of the single year of 1901-02 alone destroying values estimated at $18,000,000.

In the White Mountains of New Hampshire a similar situation exists, save that there the work of destruction has been carried farther. It is hardly an exaggeration to say that not only the well being but even the very existence of much of New England and the South depends upon saving the woods of these two sections.

And how may they be saved? But one way is known to man. A few more years of *laissez faire,* and the day of salvation will be past. All concerned agree that only the strong arm of the National Government is sufficient unto these things; that only by the establishment in the White Mountains and the Southern Appalachians of national forest reserves can the gloom of the second picture gradually be transformed into the brightness of the first.

A bill to authorize the Secretary of Agriculture to purchase lands in the Southern Appalachian and White Mountain regions and convert them into national forest reserves is before Congress. It has the support of all interested. It is backed by a galaxy of statesmen, business men, professional men, newspapers, and organizations, north and south. It has passed the Senate without a dissenting voice and has been favorably reported from the committee in the House. It is understood to be favored by a majority of the members of the House, and its

DEEP GULLIES ON AN ABANDONED HILLSIDE LAND ON TRIBUTARY OF CANE CREEK.
White pine is slowly restocking this area, but the erosion is so rapid that seedlings with difficulty secure a permanent foothold. Mitchell County, N. C.

favorable consideration is earnestly urged by the President.

Whether or not this bill shall become a law depends upon whether it may be brought to a vote. The decision of this question lies with the Speaker of the House.

Again, with this bill it is virtually a case of "now or never." The ground gained in the last session is retained until the 4th of March next. Then, unless the bill shall have become a law, all is lost. At another session the work will have to be begun anew. But by that time, as already in the White Mountains, the mischief will largely have been wrought in the Southern Appalachians. The horse will have been stolen and the stable burned.

Now is the time to strike the blow. Friends of the measure should arouse themselves, and every effort should be put forth to ensure favorable action by Congress while yet there is time.

WASHINGTON, D. C.

A Pioneer

BY MARY AUSTIN

GOODHOPE came out of Warwick Mead,
  Hating the law of the elder son,
And the Old-World rule by which they breed
  Each to the guerdon his father won;
Never a chance for God to make
A good true man for his manhood's sake.

Goodhope came to a big new land,
  Noblest ever a free man trod,
Hollow and hill-slope fitly planned
  Fresh from the galcier mills of God,
Rain-wet steeps where the redwoods grew,
Rivers roaring the valleys thru.

That was a land for a man to love;
  Rosy the snow the spent cloud spills
Over the dark-spiked pines above,
  Rosy with blossom the round-browed hills;
Wind-sown lichens of russet and red,
Never a rock uncomforted.

Goodhope gave of his best to the land—
  For a new land takes of a man his best,
Blood and body and brain and hand—
  Goodhope trusted the land for the rest,
And the land repaid him the deep-drawn breath,
And the high red pulse that laughs at death.

Paid him the increase of barn and byre,
  Drudged for him deep in her secret ways,
Wrought him a balm for his heart's desire,
  Rendered him coin of her noble days,
Mothered him, moulded him till he grew
Fittest for working her purpose thru.

Goodhope wrestled with flood and wood;
  And this is the law of the Pioneer—
Where one true man makes foothold good
  Ten true fellows may stand next year.
Into the wilderness drove the wedge;
Men like these were its cutting edge.

Goodhope walked in a fair, large town,
  Mill-smoke wreathing the thin white spires—
Whispers of empire ran up and down,
  Pulsing over the world-strung wires,
Heard men say with a laugh and a sneer,
"There is old Goodhope, the Pioneer."

Goodhope died at the end of days,
  Men with their feet in the ruts of trade
Dealt him a tardy dole of praise
  For the good they won from the chance he made,
Said, "It is well that our schemes have room,"
Elbowed and jostled above his tomb.

Raised to him never a monument,
  Leaving him prone in his well loved sod,
Back to its blossoms his ashes went,
  But somewhere far in the halls of God
Farther than prophet or sage can peer,
The spirit of Goodhope is Pioneer.

Literature

Early American History

Dr. J. Franklin Jameson has recently surrendered his work in American history in the University of Chicago in order to assume broader responsibilities over the whole historical field and to all historical workers in America. Years ago, before he left Brown for Chicago, he was editor of the *American Historical Review;* his resignation at Chicago has enabled him to resume this editorial work, and to become Director of the Bureau of Historical Research of the Carnegie Institution of Washington. And now he may be looked upon as administrative head of the historical profession in America, while in 1907 he will be President of the American Historical Association.

The professional position of Dr. Jameson adds significance to the work of which he now appears as general editor, and which is of first rate importance on its own account. The growth of libraries with well-developed interest in American history has, in the past three decades, placed many original editions out of question for all but the oldest and wealthiest of institutions. Various publishers have tried to meet the need of the unprovided; some with the costly limited edition, others with popular reprints. But Professor Jameson has now secured the approval of the American Historical Association for a comprehensive series of *Original Narratives of Early American History,** which shall bring the originals to the student with authoritative editorial machinery and without extortionate cost. The countenance of the association means much, for it has hitherto been reserved in spite of the vigorous effort of one editor to obtain it, and the assumption of another that it had been obtained. Its scholarly guarantee to the purchaser ensures for it a cash value to the publisher.

The first volume of the series has now appeared from the press of Charles Scribner's Sons. It deals, naturally enough, with the earliest of American discoverers, the Northmen, Columbus and Cabot. It is to be followed closely by the French and English voyages of the sixteenth century in a second volume, and a third volume including Cabeza de Vaca, de Soto and Coronado. The editors of the several narratives, as announced, seem to be well fitted for their work.

The Northmen, Columbus, and Cabot, 983-1503 is the joint work of Professors Julius E. Olson, of Wisconsin, and Edward Gaylord Bourne, of Yale. No comment upon their fitness is needed. Professor Olson arranges in his section of the volume the Saga of Eric the Red, the passages from the 'Flat Island Rock," Adam of Bremen's account, and certain selections from the Icelandic Annals and the Papal letters. He prefaces his documents with a cautious introduction that gives needful bibliographical details and refrains from attempts at definite identification of Vinland.

The Columbus and Cabot documents fill five-sixths of the volume. The former group includes the obvious letters of Columbus, the journals of the voyages, and the agreements with the crown. In the latter are the letters of Pasqualigo, Raimondo de Soncino, and Pedro de Ayala. There is a modern map of the voyages of Columbus, a facsimile of the Cantino chart, and one of the first page of the Spanish folio of the letter of Columbus.

If this series shall continue as it begins, we shall finally have in it the available general collection for which scholars have long yearned. There is a sanity and freedom from controversial bitterness in the editorial portions which commends the volume warmly to us. The hand of the master is obviously present. And the editors have recognized, as is wise, but, alas, only too rare, that the text is the thing; that the volume of reprints is valuable for the originals which it contains, and is not a proper show-place for editorial accomplishments.

* Original Narratives of Early American History. Reproduced under the auspices of the American Historical Association. General Editor, *J. Franklin Jameson.* The Northmen, Columbus and Cabot. Edited by *Julius E. Olson* and *Edward Gaylord Bourne.* New York: Charles Scribner's Sons. $3.00

Our Great Southwest

THE "See-America-First" campaign is apparently bearing fruit if one may judge by the fact that books describing various parts of the United States begin to be issued in numbers rivaling those on Italian cities. Among the best of these are Mr. James's books on Southern California, to which he has just added a very comprehensive and interesting work on the *Colorado Desert*.[1]

Most people do not know anything about the great Colorado desert except that it is liable to be turned into a lake unless the engineers can induce the river the change its mind and run into the Gulf of California, as it used to, instead of into the Salton Sea, as it has taken a notion to do recently. Whether they can do this or not is still uncertain, and it is also uncertain whether their success or failure will be most beneficial to the country. There are those who hold that the amelioration of the climate that would result from the conversion of the sandy waste into a great fresh-water lake would be worth the sacrifice of the farms, towns and railroads it would cover. Mr. James states fairly the argument on this side, but he proposes a middle way with the advantages of both, that is that the waters of the Colorado River be indeed turned into the desert and evaporated, but only after they have irrigated the region and converted it into fertile fields. Wherever the desert is touched with water flowers and grass spring up as tho by enchantment, showing that its sand contain both seeds and plant food ready to be brought to life. The Colorado River would be another Nile and support a civilization higher than Egypt, because it now carries down to the ocean every year enough fertile soil to cover an era of fifty-three square miles a foot deep. But Mr. James loves

his desert as it is, and he describes it all with the pen of a lover; its pure, dry atmosphere that heals the lungs and endows the eye with telescopic power; its drifting sand dunes that obliterate the footprints of the traveler and bury him when he has lost his way; its mountain pinnacles fantastically carved by the sand blast; its canyons, thru which the wind forever blows; its mirages that deceive the tourist with visions of cities, trees and rolling surf, and all its strange forms of vegetable and animal life, its palms and cacti, its Gila monsters and horned toads that weep tears of blood.

Miss Lilian Whiting's new book[2] must be mentioned in this connection, because it deals in part with the same region, but it makes a poor showing in comparison with Mr. James's thoro and

THE GIANT CACTUS.

original study. She also has fallen in love with the great Southwest, and gushes most enthusiastically about everything she sees and hears about from Greeley potatoes and Pueblo iron to Pike's Peak and General Palmer. The book may serve a useful purpose in lightening the dense ignorance prevailing on the Atlantic seaboard about our country. There are many persons who will be as surprised as she to learn that in the wild and woolly West the ladies dress fashionably and read real books, and that the development of electric cars, telephones and lights is carried much further than in the East. Miss Whiting has collected a lot of miscellaneous information about Colorado, New Mexico, Arizona and Southern California, but she has not added to its interest by her treatment of it and her way of dragging in the names of men, railroads and hotels gives rise to a suspicion of log-rolling.

Babylonian Texts

THE long title of Dr. Ranke's valuable work* is somewhat misleading. The tablets here published were not excavated by the Babylonian Expedition of the University of Pennsylvania, but were purchased in London and Bagdad in 1888-89, and it is interesting to note that included in these purchases were two of the tablets which Dr. Hilprecht represented as having been excavated on the site of the so-called "Temple Library" at Nippur in 1900. The designation Vol. VI., Part 1, is also misleading. "Volume VI." presupposes the existence of five other volumes, but the announcement on the back cover shows that volumes two to five *do not exist.* Similarly volumes seven and eight likewise do not exist, and yet volumes nine and ten have been published. There are no volumes eleven to thirteen, and yet volumes fourteen and fifteen have been published. There are no volumes sixteen to eighteen and yet volume nineteen is announced. Furthermore, after Series A. another series, called D, is announced; but there do not appear to be any Series B and C. When, therefore, volume nineteen is published (and it is announced as being in press) it will not be the nineteenth volume, but by actual count the seventh volume.

For this, however, Dr. Ranke is not responsible. His work has been done in an exceptionally satisfactory manner. The copies of the texts published by him have been executed with the same painstaking care and conscientious neatness that characterize the publications of his former colleague, Professor Clay, to whom we owe four of the six volumes hitherto published by the Department of Archæology of the University of Pennsylvania—and higher praise cannot be given.

In the Introduction, covering thirty-three pages, Dr. Ranke gives his reasons for concluding that the tablets included in his volume came from the city of Sippar—about sixty miles north of Babylon—where an extensive temple archive and the remains of a temple school were found by Rassam and Scheil. The proof is conclusive, chiefly thru the occurrence of personages in the tablets that are found on other tablets coming from Sippar, apart from the fact that the god invoked in many of the tablets is Shamash, the patron deity of Sippar, and that in some cases even the name of Sippar is expressly mentioned.

The most valuable part of the Introduction is the discussion of some of the chronological problems connected with the early history of Babylonia. If his view that the kings of the so-called second dynasty of Babylon, occurring in a Babylonian chronicle that is our chief source for the chronology beyond 1100 B.C., represent rulers contemporary with the first dynasty, this would necessitate a revision of the date for Hammurabi, who would have to be moved down a few centuries from 2250 B. C., which is now the date assigned to him. While the question cannot as yet be definitely decided, there is much to be said in favor of Ranke's view that for a time the kings of Babylon, altho claiming supremacy over Sippar, yet recognized the

* THE BABYLONIAN EXPEDITION OF THE UNIVERSITY OF PENNSYLVANIA. Series A. Cuneiform Texts, edited by *H. V. Hilprecht.* Vol. VI, Part 1. Legal and Business Documents from the Time of the First Dynasty of Babylon, chiefly from Sippar, by *Hermann Ranke.* 4to, 79 pp., 71 autographed plates and 13 photographed plates. Philadelphia: Published by the Department of Archaeology, University of Pennsylvania. $6.00.

former independence of which it was the center by conceding to Sippar the privilege of having its own "viceroys"—as we might call them. A difficulty, however, arises from the circumstance that of four such supposed viceroys now known, the name of only one occurs in the list of rulers of the second dynasty, and in this case may be due to an accidental similarity of names. Besides, the reading of the name of this viceroy is not absolutely certain. Again, since the Babylonian chronicle was drawn up for the purpose of controlling and illustrating the dating of legal and commercial tablets, it would seem strange to introduce in successive lists two sets of rulers who were contemporaries. The existence of independent viceroys at Sippar may, however, be admitted without accepting the other hypothesis. Dr. Ranke also claims to have found some additional evidence for his view that it was customary in certain cases to invoke in the dating of legal tablets the name of the Assyrian king or *patesi,* as he was called in early days, with that of the King of Babylonia, but the theory, tho very suggestive, rests on too uncertain a foundation. Bêl-tâbi does not sound like an Assyrian name, and the addition of the words "and his consort" occasions another objection against accepting Ranke's contention that Bêl-tâbi is the name of the *patesi* of Assyria contemporaneous with Sin-muballit. Why cannot Bêl-tâbi be another viceroy of Sippar recognized by Sin-muballit as the four others were that Dr. Ranke pointed out?

One of the most interesting tablets in the collection is No. 96. According to Ranke, it records the adoption of a woman and her child (?) by a priestess of the temple to the sun-god at Sippar, but since this priestess is the mother of the woman in question, adoption seems to be a superfluous procedure. The term used which Ranke regards as indicating an act of adoption signifies "to cleanse." The expression points, as Ranke has seen, to a ritualistic ceremony, and one thinks, therefore, of "sanctification" to a deity. The term would correspond to the Hebrew *koddesh,* frequently used in the Pentateuchal Codes to denote the hallowing of persons to Jehovah. It is this kind of adoption that appears to be indicated in the tablet in question, and this interpretation accords with the context in four of the five additional passages quoted by Ranke in which the term is used. In the fifth passage a different rite seems to be meant. The mother-priestess sanctifies her daughter to the cult of the sun-god and thereby makes the latter her successor, in return for which the daughter agrees to provide for the support of the mother as long as the latter lives.

There are many other tablets in Ranke's publication that throw an interesting light on social and religious conditions in the days of the first dynasty of Babylon, and special attention should be called to the unusually large tablet No. 119, recording a number of purchases united into one text.

The copies made by Dr. Ranke show that he has made a thoro study of his material, and with the help of the sign list and of the specimen tablets translated by him the path is made easy for the one who wishes to enter upon the study of the business documents of the third millenium before our era. The carefully drawn-up list of proper names of men and women, of scribes, officials, gates, rivers, canals and deities contained in the tablets is another feature that adds greatly to the value of the work. Altogether, Ranke's publication may justly be called a model of its kind, and it is therefore a source of regret that so thoro and useful a scholar should not have been retained in this country. He resigned his position at the University of Pennsylvania at the time of the unfortunate "Nippur" scandal, and is now connected with the Royal Museum of Berlin.

By the way, has not Ranke been misinformed in stating that "the second Prince collection" was purchased at Hillah by Dr. Hilprecht in April, 1889? Included in this collection is the famous "Lushtamer" letter, which was one of the tablets that Hilprecht had represented as having been excavated at Nippur in 1900, and there is satisfactory evidence that this letter, as the other tablets of the second Prince collection were purchased by Mr. Noorian (the interpreter of the first expedition to Nippur) at Bagdad on July 5th, 1889, as has been

pointed out by Professor Jastrow in his paper, "Did the Babylonian Temples have Libraries?" published in the twenty-seventh volume of the Journal of the American Oriental Society.

A Hebrew and English Lexicon of the Old Testament. With an Appendix containing the Biblical Aramaic, based on the Lexicon of William Gesenius, as translated by Edward Robinson. By Francis Brown, D.D., with the co-operation of S. R. Driver, D.D., and Charles A. Briggs, D.D. Large. 8vo. Pp. xix, 1127. Boston: Houghton, Mifflin & Co. $8.00.

The Hebrew lexicons hitherto accessible in English are about fifty years old. With the enormous progress in Semitic studies since the death of Gesenius, a lexicon practically new and completely rewritten was a crying need. This Professor Brown has been engaged upon for many years, and the first part of the present work appeared sixteen years ago. He has devoted the larger part of his work to this task, with the assistance of Professors Driver and Briggs, and its completion is a monument of careful industry. The book contains several times as much matter as Robinson's Gesenius, and the extraordinary compression by use of contractions and signs still further increases the amount of text. Especially important is the use made of comparative philology in giving parallel forms in cognate languages. The Assyrian has been brought into service to great advantage, a source inaccessible to Gesenius and Robinson, and neglected by some later German lexicographers. We notice that the words are arranged under the roots, so as to show the relation of the resultant forms. To be sure, there is some difficulty, especially in such a case as the root *dabar,* whose original meaning is unknown, and which has such varying derivatives as those which mean *word, desert, pestilence, guide* and *bees.* But the difficulty is relieved to the student by referring the words in their alphabetical order to their roots. Professor Driver is responsible for pronouns, prepositions, adverbs, conjunctions and interjections; and Professor Briggs for many religious terms, while Professor Brown is responsible for the plan of the work and all other words. We regret that the price of this essential dictionary will conduce to the further neglect of the Hebrew language in our theological seminaries.

Paul. By E. F. Benson. Philadelphia: J. B. Lippincott Co. $1.50.

Mr. Benson always impresses us as just failing of producing a great novel. In "The Angel of Pain" last year he almost touched the mark set by the giants, and he has, once again, escaped by a hair breadth writing a novel of the first rank. In some respects *Paul* is an advance over "The Angel of Pain." It is more human. The strain of the supernatural which marred the former book is lacking. To be sure, there is a human weasel, a sufficiently uncanny creature to sate the most morbid appetite for the unusual, yet there is no god Pan, with his hideous hoof-prints across the pages, as in "The Angel of Pain." We felt, with impatience, that Pan, in addition to many outlawed misdeeds, spoiled an otherwise fine book. *Paul* is in some respects a return to the earlier manner of "Dodo," and much of the dialog reminds of that vivacious lady. In general the conversations are good — quite silly enough to be natural. We rarely in our private conversations talk as wisely as do most book people. Mr. Benson permits his characters considerable latitude in the line of frivolous fooling. Paul of twenty-five "of the silly things called years" insists that he is but eleven, and remarks whimsically, "Eleven is a very good age to be." The growth of this irresponsible being into a man is the theme of the story, and his soul is awakened, as with Donatello, by a deeper tragedy than Mr. Benson's supreme lightness of touch leads us to anticipate. Paul is charming, Norah a true-hearted English girl of a singularly uncomplicated nature, and the human weasel is an interesting, altho abhorrent, specimen of cleverness, cruelty and cunning. The weak point in the book is, to us, the attraction which the uncanny beast had for such a wholesome girl as Norah, but inasmuch as "what she saw in him" or "he saw in her" is still the endlessly unsolved mystery in the case of our own acquaintances, we may not hope to fathom the curious affinities among book people.

Editorials

The Duty of Directors

THESE are the days when some of us are accustomed to review the completed year, marking the signs of gain or loss in various fields of human effort, and striving to learn something from the finished record of what has taken place. There are lessons for directors of great corporations, and for those with whom these directors are associated, in the past year's remarkable list of indictments, prosecutions and convictions of such corporations for violations of laws that are just, well known and easily comprehended.

Take our great railway companies, for example. The New York Central, Burlington, Atchison, and Alton, with several of their officers, have been tried, convicted and fined. Imprisonment would have been the punishment of some of these officers if provision for such a penalty had not been repealed in the statute under which the indictments were found. It was restored in the new law, which has been in force since August last. Scores of indictments against other railroads for similar offenses are pending. The Union Pacific, Pennsylvania, St. Paul, Northwestern, Great Northern and others are soon to be put on trial. And the same is true of powerful industrial companies. The great Sugar Refining Company has been convicted under certain indictments and has admitted its guilt under others. Conviction has been followed by fines in the cases of the Chicago beef packers. Trials are soon to take place upon a host of indictments involving the Standard Oil Company.

The offenses in question were something more than violations of law which affect only the two parties directly interested—the railway and the favored shipper. They were designed to affect other persons or corporations injuriously, to ruin some of them, if possible, by stabs in the dark. The wickedness of these crimes was described by Judge Holt when he imposed penalties upon the New York Central. The evidence of guilt, he said, was "clear, conclusive and undisputed." The crime was one which "in its nature" was "deliberate and premeditated":

> "Such a violation of law, in my opinion, in its essential nature is a very much more heinous act than the ordinary, common, vulgar crimes which come before the criminal courts constantly for punishment, and which arise from sudden passion or temptation. The crime in this case was committed by men of education and of large business experience, whose standing in the community was such that they might have been expected to set an example of obedience to law, upon the maintenance of which alone in this country the security of their property depends."

It appears, therefore, that the defendants were fortunate in being tried under a law which provided for punishment only by fines; many who are convicted of the less heinous but more common offenses are sent to jail.

Now, all these erring railroad companies and industrial corporations were controlled and governed by directors. And many of these directors are men of education and large business experience and good standing in the community. There are handbooks in which the names of all of them can be found. The list includes men of world wide reputation, eminent financiers, national legislators, and men regarded as philanthropists, men who are members of churches.

How did it come about that they allowed these crimes to be committed? They were in highly responsible positions. Were they ignorant of the offenses? Then it is fair to say that they should have ascertained in some way whether officers for whom they were responsible to stockholders and the public were doing business honestly or were systematically violating the laws. If they realized that they could not so control the business under their management that it would be carried on honestly and lawfully, then they should have given up their offices. If, on the other hand, they knew of the crimes and either remained silent or gave their approval, then some of them are contemptible hypocrites.

We have not heard of the removal of any of the executive officers who have been found guilty by the courts or whose immediate responsibility for the violations of law was shown at the trials. This leads us to think that the directors of their companies, if not those of other cor-

porations, are inclined to overlook or even to approve offenses of the kind.

The beginning of a new year is a good time for the directors of all railways or of corporations that use railways to question themselves as to their responsibility and duty, and, if they themselves are honest and believe that the laws should be obeyed, to make sure, if this be possible, that the conduct of the officers under their direction is honest and lawful.

New Year's Resolutions

THE making of good resolutions on New Year's day is a part of the sentimentality of the season, just as patriotic speeches are associated with Fourth of July occasions. The best of us resolve to do better, and the worst of us resolve it even more stringently. That is the curious and pathetic thing about this promise-making to the future. The most comprehensive, iron-clad resolutions are always made by the class of people who are least likely to keep them. The lazy man makes up his mind tersely to be industrious. The mean man resolves to be kind, and the drunkard swears to keep sober. And that is usually the beginning and the end of their performance. If all the fine resolutions made by them on New Year's days, and subsequently broken, were recorded, they would represent more virtue and heroic action than the angels in Heaven could practice. The question is why do the weakest, most tempted of men make the most ardent display of reforms at such times? Because for a moment the clean page and fair vow overlays the failures of the dead year. They are shriven, made whole by a sentiment. Every resolution is a wand which they raise against their powers of darkness. They know how brief the magic is, how soon the time will come when they will have the strength no longer to lift it against the wild delirium of some old desire, but for the sake of the fleeting vision it affords of the normal, peaceful life, no other class cherish so dearly the right to make New Year's resolutions. In every case, it is the measure of their weakness girded up in words expressing power and resistance. It is their perennial proclamation to Heaven that beneath the broken wings of life they still retain an impotent, spiritual likeness to the God of all goodness. And as such evidence they command respect. But that is not all. It is high time we learned the reason and the remedy for the fact that the fool and his resolution are soon parted. The reason, of course, is that a man will break thru the Decalog, much less a New Year's resolution, in order to get back to his habit, whatever that is. He cannot discard this old easy wearing, sagging garment of his soul for a new one with a resolution which makes the whole New Year a magnificent misfit. Now when we consider that these very people have a genius for remorse, that a puerile regret is a symptom of their disorder which casts them ever deeper into their slough of despond, from which they only escape momentarily swinging to the stirrup of a New Year's resolution, it is important to lend them a helping hand.

In the first place they are not all weaklings and cowards. The man who survives every defeat of his moral nature with courage enough to "reform it" ever and ever again, is often braver and stronger than many a saint born and suckled in some amen corner of life who did not inherit so many proclivities toward damnation. Hereafter we shall know more than we do now about courage; then there will be a new honor rôle for mankind, and some of the last shall be first.

Meanwhile this is another new year, and here is the great host of the morally weak and maimed regarding it as weary, dying men regard a forlorn hope. The old year, in which they sinned so deeply, failed so completely, is dead. If only God would blot it out of their remembrance forever! Well, here's to you, comrades, sorry veterans of a hundred lost battles! Here's hoping for the fellows who wear no laurels for victories won! And a word of advice: If we showed more wit in avoiding temptation, we should find it easier to keep our New Year's resolutions. The drunkard who writes his in the family bible and ratifies it with a sincere and eloquent prayer, has only stretched a horsehair between him and the fatal cup. It is better to set cunningly about 'breaking the entail" of the terrible habit.

Do not depend too blindly upon the supernatural. The devil is also supernatural; as for the holier grace, there is such a thing, but few drunkards have the power in their sad extremity to invoke it. They are too fallen in courage, too deeply buried beneath memory and remorse to be guided at such a time by guardian angels. The thing for him to do is to change his tactics. It is because we stay in the same old ruts so persistently that our own particular devil knows so well where to find us. Therefore, when the thirst comes, do not try to stand against it by reminding yourself of the vow. That thing was born of a mood, and is more likely to become the skeleton in your closet than the sustaining rod of your spirit. Do not even contemplate the consequent misery of your family. All this excites the emotions and weakens the will. Take a header somewhere. Bad people should not have a monopoly upon this very healthful method of recreation. Use your imagination, think of something innocent and daring to do, and keep up your adventures till the astonished nerves and brain react and you forget in the novelty of new experiences the awful craving. Many a man would save himself the humiliation of a spree if he walked as far into the woods as his strength would carry him, or if he sought some strange new companionship. Some of us are so narrow-minded that we do not understand that such a companionship is not necessarily bad. A man in such an emergency might state his case fully to another, even if it were a policeman, or a coroner, and be sure of help. "But," says the tempted one, "that is a confession of unmanly weakness!" To be sure, but it is not nearly such an ugly, sickening, shameful confession as getting drunk is. The important thing is to break the entail, and this requires a witty lawyer of human nature, who is ready to take every advantage of circumstances and even of possibilities.

But the drunkard is not the only one befuddled by his New Year's resolution. There is, for example, the mean man who resolves to be kind. He has no particular vice, but excels in a sort of aggravating righteousness at other people's expense. His case is especially sad, because no one excuses him, and no one except those nearest and dearest to him know how inexcusable he is. Still, he is not without compunction, and on New Year's Day he also contributes his resolution to the pavement of good intentions. He is very proud, very reserved about it, because it would detract from his dignity and authority to admit the possibility of an improvement in character. But when the whole family knows he is a "perfect bear" all the year round, cynicism curls every lip at the exhibition of his preternatural sweetness on New Year's morning. They understand perfectly that there is a little paper resolution back of it which does not usually last thru the day. For an ill-tempered man can no more become amiable upon the strength of a New Year's resolution than a grinding-stone can rise upon dewy wings. Let him begin humbly by trying to behave pleasantly at the breakfast table. If he can achieve this much by the Ides of March, his family will be mystified and delighted. Then things will be easier for the mean man, since there is something piquant, vanity satisfying in mystifying one's own family, who are supposed to know all his uprisings and down-sittings. He is encouraged to become the hero of his domestic hubbub. And in the course of another year he may be sufficiently disciplined in courtesy and kindness to make and keep a New Year's resolution to that effect.

There are others by the thousand who make and break these vows, but we must not forget that particular class who know how to keep a New Year's resolution. With them these golden texts of conduct are pretty moral gymnastics which prove nothing but the vanity of the performer. They are experiments in will power. Thus, a peevish, restless man who wakes early resolves to walk a mile before breakfast every day of the year, and he can do it, because it is a relief to him, not a virtue. Or a phlegmatic person, with a bilious temperament and no particular craving for stimulants, will resolve to "quit coffee," altho he may have a dozen vices on which he fattens the whole year, while he brags of the ease with which he "lopped off a bad habit," meaning coffee. Such peo-

ple ornament themselves with toy resolutions which never affect character, even when they keep them, and they usually have the vanity to do that.

But here is the point at last for serious consideration. Do not give these promissory notes to the future till you have got rid of the bankrupt habit which calls for the resolution. It is a sentimental form of dishonesty which we practise at our own expense.

The French Deadlock

On Saturday last the French Senate accepted the bill previously past by the Assembly, and enacted the concluding law addressed to the recalcitrant bishops who had refused to accept the law of a year before for the separation of Church and State and the establishment of cultual associations to administer the church property. We have called the bishops *recalcitrant,* but that is hardly true; they are, rather, obedient—obedient to the Pope than recalcitrant to the State. We cannot blame them, if their religion requires them to obey the Pope rather than the nation, for patriotism must always yield to religion; we must "obey God rather than man"; and a President of the United States, the only one, we believe, who liked to drop into poetry, tells us:

"And say not then, 'My country, right or wrong,'
Nor draw thy sword in an unhallowed cause.
But when thy country wanders from the right,
Furl up her banners and avert thy sight."

But it is a great pity that religion should concern itself so with technicalities of the management of property owned by the State and loaned to the Church. In this case the French bishops had been ready to accept the "cultual associations," or boards of trustees, to administer the property, but were forbidden by the Italian Pope.

The law of last week is directed against those who refuse to accept the separation law of 1905. They may yet hold and administer houses of worship under previous general laws. Thus two or three men may make a declaration that they wish to maintain worship in a church and will be responsible for order. They must make declaration once a year. But this does not apply to anything but churches; all bishops' and priests' residences which belong to the State or to towns, and all other ecclesiastical buildings, must be given up for such use or sale as the State or town may choose. Further, the clergy who refuse, under orders from the Pope, the separation law will lose all their pensions, which continued for life in the case of those over forty-five years of age, and for from four to eight years for younger clergy.

Thus the Pope's command to refuse establishing cultual associations loses the Catholic Church its buildings, so far as they have been the property of the State since the Revolution, and also its pensions. And the Pope forbids the Church to organize other associations as now provided under the previous general laws, and the priests will obey. But not the laity. They will establish and have established associations to keep up worship. The main cathedrals of Paris are already protected. Thus religious worship is preserved, and the chief loss will be of the pensions, which the faithful must make up, as in this country, by their voluntary contributions. As to the other ecclesiastical buildings belonging to the public, we presume they will be rented to the bishops and priests at a nominal figure, just as the clergy who have said mass without making a legal declaration of their purpose to hold a public meeting, have had only nominal fines imposed on them, from twenty cents to a dollar.

Why is it that the Pope thus forbids these associations which the bishops were willing to form? The ostensible reason is that the cultual associations are dangerous; that it is not stated in the law that the bishops shall organize them; they may be schismatic. But there was no provision against their being composed of priests or bishops to control them, and the bishops were ready to try it. The real reason was probably one not expressed in the law. The Pope has complained that the Concordat had been abolished without being "denounced." France had not consulted him, and sought a new arrangement, but had acted quite independently. It had not recognized him as an inde-

pendent Power, as it would have recognized Germany or Austria. This weakens his temporal power. It ends his right to send ambassadorial legates. It threatens his power over other Catholic States. He could give no assent to such loss of dignity. He has a Secretary of State, and he clings to the shadow of his diplomatic rights. If France follows the example of the United States and will have no Concordat, other Catholic nations will throw overboard their Concordats and will separate Church and State. But France, he hopes, is still loyal, and will come to him and submit if he is unyielding.

But France will not submit to what is regarded as foreign dictation. And the Catholic Church in France will learn, if Pius X and Merry del Val are slow to learn it, that this separation is the greatest blessing the Church could receive. American Catholics know it. To be sure, they loyally join their chorus to the Vatican cry of oppression and robbery, but they yet recognize that this "persecution" is freedom and privilege. The Church will prosper under this separation law as it has never prospered before, and as it prospers in this country. It will have peace and liberty. To be sure, it will lose some pensions, and perhaps some establishments. But that is a temporary loss, and is due to the *intransigeant* attitude of a Pope guided by a young, reactionary Spanish Secretary of State, a Pope who was elected because he was good and favored administrative reforms within the Church, but was not, like his predecessors, a diplomatist or a statesman. Under Leo the crisis would have been postponed.

Results in Atlanta

THE reconstructive movement in Atlanta, the scene of the September race riot, to which we referred at length in these columns recently, is proving to be no *ignis fatuus*. On the contrary, it is leading public sentiment to real results. This we are glad to note, for one of the purposes for which THE INDEPENDENT was born was to bring about just views on this race question.

One of these results has been to secure for Atlanta its first quiet Christmas. In common with the South Christmas in Atlanta has been a time of revelry and riot, fire and fatality, violence and death. Christmas is a red day in the South. So it was with much concern that the people of Atlanta noted the approach of the Christmas holidays; it was feared that the race riot would be renewed; and when so many people were seen to be buying guns this feeling seemed justified. But Christmas day came, and a Sabbath stillness hung over the city. For the first time the life of pedestrians was safe on the streets; fireworks were conspicuous by their absence. What might have resulted seriously was nipped in the bud by the co-operation of the white and colored committees. A white guard in Brownsville, a colored suburb, became drunken and rowdy; communication was had with the secretary of the colored committee; he communicated with a member of the white committee; who communicated with the sheriff; the sheriff went at once to the scene, disarmed the disturbing guard and put him in jail; and thus a riot was nipped in the bud, thanks to racial co-operation.

Another result has been the making of Atlanta a center for the creation of public opinion for law and order in the South. Atlanta is the strategic center of the race problem in America. When Sherman struck a blow at Atlanta he broke the backbone of the rebellion. So when a stroke against racial injustice is made in Atlanta the beginning of the end of the trouble in the South is at hand. A remarkable editorial appeared in the Atlanta *Constitution* of December 28th on the Christmas race riot in Mississippi. Its subject was "Race Prejudice." It pronounced it an evil "the most deadly, the most devastating, the most terribly defiant of the laws of man and God." Then it made a plea for "justice within the law, administered by officers of the law." Going deeper it probed to the cause of the Mississippi trouble, and laid it at the door of the Governor of the State. Referring to Governor Vardaman, it said:

"Well he might—in eleventh hour repentance—strive to undo or quell the murderous mischief, for a part of which, at least, he cannot escape responsibility.

"During his political campaigns before the people this man has deliberately, systemati-

cally, without losing one opportunity, taken advantage of the smoldering passions he knew were at the base of frail humann nature, whipping the prejudice of the Caucasian against the negro to a white heat; appealing to the lowest, most debasing instincts which must sadden the Almighty when he looks upon the human soul; utilizing every trick at the command of the ingenious demagog to set white against black, to substitute unrest for tranquillity, an armed truce for a peace well tried and well established.

"For at the time Vardaman was sowing dragon's teeth thruout Mississippi, there was not the barest excuse for his appeal to race prejudice. White supremacy was established, beyond peradventure. His offense, therefore, against his own State was doubly wanton and gratuitous. He was willing, for the sake of trivial political capital, to plant virulent seed which now germinate in such gory harvests as those at Scooba and Wahalak, and which are being emphatically condemned by the white people of the South."

It is straight talk like this that will open blind eyes and create sound public sentiment.

The other result to which we wish to refer is the check that is being put on the saloon power. It will be recalled that the open saloon was one of the contributory causes of the riot. It was the low dives where mean whisky was sold to negroes by whites that bred the criminality which furnished an excuse for the outbreak of the mob; and it was from the doors of the saloon that the ruffians of the mob poured forth to do their deadly work on the innocent. One of the first of the measures for pacification was the revoking of every license for the sale of intoxicants of any kind thruout the city, and for nine days Atlanta was a prohibition city. When it was felt safe to reopen the saloons, one-third of them were refused licensure. Another movement is on foot to increase the license for the sale of intoxicants, reduce the number of saloons and confine them to the center of the city. Those leading this are thus trying to shunt off the prohibition election scheduled for next spring. The Anti-Saloon League is behind the prohibition movement, and the leaders of the races are co-operating to bring together the better element of both races to put out the saloon. Some fear is expressed concerning the negro vote; in a recent gathering Rev. H. H. Proctor predicted that two-thirds of the negroes would vote against the saloon. He contended, and we believe rightly, that it was not necessary to disfranchise the negro in order to get liquor out. For in the last prohibition election in Atlanta, eighteen years ago, the only precinct that went dry was the one in which Clark University, the negro college, was located, the majority of the voters being colored.

It is gratifying to note these results from this united inter-racial movement. Other reforms are in sight. We could only wish that this movement would gain such headway by next summer that when Mr. Hoke Smith takes his seat in the Governor's chair he will find himself unable to carry out his campaign promises to disfranchise the colored race. Of course, there is no objection to a measure that will apply to black and white alike, if honestly administered. We understand that this is what the colored leaders in Georgia ask for. Can less than this be granted?

Herewith is to be noted the fact that the Atlanta committee on the riot has reported that not one guilty negro was killed. Every one was an innocent man. Such a report is an education to the people where such riots are to be feared.

Vanderbilt University

Some months ago we presented to our readers the condition of Vanderbilt University. The question at bottom was whether it should possess scholastic freedom, or should be narrowly ecclesiastical. The university was first started, under another name, by several conferences of the Methodist Episcopal Church South. But it languished, and got no support, until Bishop McTyeire persuaded Cornelius Vanderbilt to put it on a firm basis by a large gift, a gift which has been liberally increased by his son. The university was held by trustees and was past over by the conferences to the General Conference of the Southern Methodist Church. The bishops of the Church had the right to sit with the trustees, tho not trustees, and possessed visitatorial power of vetoing the election of professors. It was a question whether they had full rights as trustees. But the trustees elected five bishops as full trustees, and thus

denied the rights of the others to act as trustees. Meanwhile the trustees were trying, it seemed, to make the university more liberal and unsectarian. It appointed a majority of professors and teachers who were not Methodists. Members of the General Conference feared that the university was slipping out from under its ownership and control, and they bitterly complained.

At their demand the General Conference appointed a committee composed of the leading judges and lawyers belonging to the Church to consider two questions put to them, substantially as follows: 1. Does the General Conference own Vanderbilt University? 2. What are the rights of the bishops in the Vanderbilt board of trustees? This committee held long sessions and have presented a long and very legal report. Their conclusions are, that the General Conference does own the university, and that the trustees are its agents. It can elect whom it pleases as trustees, when it pleases five bishops or seventeen, or it can leave to the trustees themselves the power to fill vacancies, and the trustees can choose what bishops they choose. They also decide that the bishops have the right of visitors only, unless they have been elected as trustees.

This decision will please—and displease—both parties. It gives final ecclesiastical control to the General Conference; but it does not give it to the bishops. The bishops—the whole college of them—are not trustees unless so chosen. The result will be, we presume, that five bishops will continue to be regarded as a sufficient number to protect Methodist interests, especially as Methodism has given very small funds to the institution. But the contest will now be transferred to the General Conference to decide whether it limits the breadth of the university. We think it will not. The Southern Methodist Church is as liberal and progressive a body as there is in the South, and its institutions have been its pride and crown. Vanderbilt is admirably managed, and is now the first Southern university holding this rank with the University of Virginia. The General Conference, guided by some very able and broad-minded bishops who are on the board of trustees, will be slow to reduce the university to the rank of a merely sectarian college. But there has been a very strenuous, if not bitter, conflict in the Church over the institution, and education in the South is much concerned in the result.

How the Beneficiaries "Think"

Half a dozen incidents of recent happening indicate that things are moving in the interesting case of the people versus the beneficiaries of privilege.

All of them are revelations of the curious way in which the beneficiaries are thinking about the opposition. Daniel Webster used to say that as a lawyer he followed the rule of mastering his opponent's case before attempting to work up his own. The gentlemen who hold a brief for privilege evidently are not endowed with Websterian sapience.

First among these incidents that we think worth commenting upon was the remark made by Prof. J. Laurence Laughlin, of the University of Chicago, about Socialism. We do not know what Socialists Mr. Laughlin is acquainted with, or what Socialistic books he may have read, but he has undertaken to arraign Socialism as 'the philosophy of failure." The men who become Socialists, he tells us, are those who have found themselves inadequate in the modern struggle for economic existence.

Professor Laughlin meant this description for condemnation. Inadvertently he has hit the nail squarely on the head and driven it in a good long way, a nail in the hemlock sarcophagus of privilege. Every well-informed Socialist will hail him as an ally. The only error in his description lies in his employment of the definite article. Socialism is *a* philosophy of failure, not the only one, and, in our judgment, not in every respect the best one, but still one worthy of respectful consideration.

Failure in the economic struggle for existence is one of the great social phenomena of the age. It calls for explanation. Wealth is concentrating in vast fortunes, owned by relatively few possessors. Thousands of once independent business men are passing into salaried positions, and millions of wage-earners in America fail thru thrift

and honesty to rise in the social economic scale. Individuals make their way up, but the chances of success for the many are not thought to be multiplying. Under these circumstances it is inevitable that we should have philosophies of failure, and that they should command attention.

Another incident is the discussion provoked by Mr. J. G. Phelps Stokes's criticism of the Young Men's Christian Association for offering courses of instruction to young men on the principles of investment. Mr. Stokes happens to be a Socialist and a Christian, and he objects to what he regards as the unchristian teaching of ways and means to get rich thru the ownership of capital, instead of thru social service. The New York *Evening Post,* in correcting Mr. Stokes, explained to him the elements of economic theory touching the productivity of capital, and intimated that it is really better for the working classes that capital should be productively employed than that it should be divided up among the poor. Whereupon Mrs. Mildred Minturn Scott, the gifted translator of Jaures, sent a letter to this newspaper, which, for neatness in the art of annihilation, it would be hard to match. Mrs. Scott reminded the editor that the Socialist is the last man in the world to deny the productivity of capital. What the Socialist denies is that the mere *ownership* of capital is productive, or in any sense a service. "It is as a manager or director that the capitalist should be rewarded, and not as an owner." And yet there are many capitalists, who, contributing no personal services whatever to the community, draw annually millions of dollars from the national product by virtue of their mere ownership of capital. Separation of the capitalist from the capital, by transferring capital from private to public ownership, "and the attempt to make services and rewards bear some just relation to each other is the Socialist's interpretation of Christ's command to 'sell all that thou hast and give to the poor.'"

There may well be other and better ways of reducing the failures in the economic struggle than what Socialism advises, and it may well be that Mr. Stokes has not yet reached the last interpretation of Christ's teachings as to wealth, but the beneficiaries of present conditions need to understand the doctrine which they attack.

New Sciences and New Scientists

By usage, tho contrary to etymology, the term science has long been commonly applied to the study of the relations of ponderable things and to the powers of nature. Of late years the word and the concept have been successfully claimed, first by the philosophers for their study of the human mind, then by investigators of wealth, commerce, social phenomena, history, politics and government. The attendants on the series of meetings held at Providence in the four days after Christmas therefore partly felt themselves to be a body of scientific experts, engaged in clearing up their concepts, formulating their methods, correlating their facts, and making their deductions in the scientific fields cultivated by the American Historical Association, American Economic Association, American Political Science Association, American Sociological Society, Bibliographical Society of America, and New England Teachers' History Association. The first two of these societies have existed and usually have met together for years; the Political Scientists have been organized only two years; and the Sociologists, an offshoot from the Economic Association, were holding their first session. This informal federation of six lively commonwealths went thru its four days' orbit with remarkable smoothness and pleasure. The skilful and foresighted arrangements of the local committee and the spirit of accord and mutuality between the various societies put the more than five hundred visitors quite at their ease. No less than six joint sessions of two societies were held, including that one in which the president of the Historical Association, Judge Baldwin, of Yale University, devoted his inaugural address to the relations of religion to history. Other joint meetings were devoted to a form of scientific

interchange of thought, which was by most of those in attendance thought more stimulating than the reading of set papers on separate subjects, viz., the discussion in brief speeches, back and forth, of such topics as the scope of sociology, the birth rate in America, child labor, control of insurance, and the tariff, into which many business and professional men were brought as expert disputants. Other interesting subjects were discussed in round-table conferences, with good-natured give-and-take of argument. A succession of general receptions and luncheons gave opportunity for the widening of acquaintance, which is one of the most cherished privileges of such meetings. Perhaps the two most important announcements of the meeting were the creation by the Political Science Association of a commission to investigate the causes of disorder and lawlessless in all the States and cities of the Union, together with the conditions of the peace officers and police; and the election by the Historical Association, as their only honorary member, of James Bryce, Ambassador designate of Great Britain to the United States.

The Native Hawaiian

There was great fear in Hawaii when our Congress made the voting rights of the native Hawaiians more liberal than the American residents desired; but the result does not justify their fears. To be sure, at first the first Legislature was bad enough, but nothing better could have been expected after the loss of native sovereignty. But the Hawaiians were moderate in their power, and the election of two years ago showed a great and conservative change. Another election took place November 6th, and it revealed again the native integrity and their fitness to be trusted with the ballot. They responded to moral leadership and showed discrimination in the well-nigh general scratching of ballots. The result was the election of the reform candidate for sheriff, against the appeal to the vicious element which wanted free license. The natives responded to the appeals of the Civic Federation, and turned down the bummers and the police ring, who, we are sorry to say, were mostly Republicans. There is in Hawaii a notable number of Chinese voters, and the larger proportion of them voted with the native Hawaiians for reform. That is a point which will not recommend them to their enemies in San Francisco.

Government in the Coal Field

It comes as a surprise, not unwelcome, that there should come from the Government the proposal that the immensely valuable coal and oil lands belonging to the Choctaw and Chickasaw tribes should be developed and controlled by the Government. The proposal comes from Indian Commissioner Leupp, and is approved, it is said, by President Roosevelt and Secretaries Hitchcock and Garfield. It is proposed to create a corporation of from one to two hundred millions to own and operate the coal and oil lands, the stock to be distributed individually among the Indians. The directors shall be the President of the United States, the Secretaries of the Interior, the Treasury, and Commerce and Labor, with the Commissioner of Indian Affairs and a representative chosen from each of the two tribes. The company shall run for twenty-five years, and as much longer as Congress may decide, and it shall own and manage the business and thus control the main supply for a large part of the Mildle West. This would be purely Government control, but not ownership. The Government would act as agent for the owners, and equally for the larger public, obligated to get the owners a fair dividend, but not an exorbitant profit. At the end of twenty-five years if Socialism progresses the Government could take the ownership, or, if Socialism fades away, the Government could pass over the control to an ordinary company. The plan seems an interesting and a wise one, except that these directors can hardly direct, as they will be too busy. Are we sure that the President would know enough about business to be a competent director? Probably the Commissioner of Indian Affairs would find this soon the biggest part of his work.

So many people are interested in the career of the Abbe Loisy, and in his condemnation by the Pope, that it will be interesting to give his present ecclesiastical status. By a special brief he was allowed to say mass at home, but this privilege expired in October, 1905. He applied to the Bishop of Chartres, in whose diocese he lives, for its renewal, but was referred to the diocese of his last previous residence, that of Paris. But Paris referred him to the diocese of origin, that of Chalons-sur-Marne; and its bishop gave the testimonial that he was in good standing when he left there twenty-eight years ago. But this letter is useless, as a Papal rule requires a testimonial from every bishop in whose diocese the applicant has lived for a year. The result is that Loisy is unfrocked. His latest and last book, "The Synoptics," is in safe hands, and will be published after his death, which may not be far off, as he suffers from a chronic disease.

The acceptance by Charles F. Aked, D. D., of Liverpool, of the pastorate of the Fifth Avenue Baptist Church, in this city, will add a prominent figure in the American pulpit. Dr. Aked is but forty-two years old, and one of the most forceful men in the religious circles of England. He is progressive in theology, deeply interested in public affairs, was a leader in the "passive resistance" movement against the collection of taxes for religious teaching, and published a protest not long ago against American lynching. An effort was made to dissuade him from accepting the call by saying that he would be a beneficiary of Mr. Rockefeller, but the wealthy parishioner assured him that his teaching would not be interfered with. He will be a much valued accession, following such men as John Hall and William M. Taylor. New York wants the best.

The San Francisco mischief-makers are trying to have a law enacted which will exclude Japanese as well as Chinese from all the public schools of the State. If they wish to correct the only seeming incongruity, that by which Japanese young men wishing to learn English attended primary schools, let them provide a separate evening school for adult foreigners, as our Eastern cities do, and let them limit the age of those who are admitted to the primary, intermediate and grammar schools, and let them make no discrimination as to race.

Seven hundred begging letters received in a day is the penalty Mrs. Sage pays in the first months of her widowhood for the impression that she intends to give away in charity the millions left to her by her husband. This importunity is an indelicacy as well as a rudeness. She says, with no little good sense, that other people of wealth should take care of the necessities in other cities, and that her own city of New York can make all the just demands that she can meet.

Possibly Ambassador Aoki may not be pleased with the report of an address which he made at a Japanese dinner in this city, in which he advised Japanese young men to marry American women, and told them that when they married American millionairesses they would help solve some international problems. California will not like that.

It is autonomy, not independence, which the annual Indian National Congress meeting in Calcutta has again asked for India. We allow the Filipinos to ask for independence. Perhaps in India they know that independence would not be good for them. But the Liberal Government in England is inclined to extend somewhat the rights of self-government.

An excellent Milwaukee paper says that "the most popular army song today is

"Damn, damn, damn the Filipinos"

sung to the tune of "Tramp, Tramp, Tramp, the Boys are Marching." If this is true we may not be surprised that the Filipinos do not love us.

To see what the example of lynching leads to, consider the horrible affair of the lynching the other day in Annapolis, where schoolboys, on a shocking "lark," took a supposed criminal from the officers of the law and killed him. What can be more tragic and disgraceful?

Insurance

The Indictment of Perkins and Fairchild

At last District-Attorney Jerome has done something. Last week the December Grand Jury found indictments against George W. Perkins, of the firm of J. P. Morgan & Co., and former vice-president and chairman of the finance committee of the New York Life Insurance Company, and Charles S. Fairchild, formerly president of the New York Security & Trust Co., a subsidiary company of the New York Life, an ex-Secretary of the Treasury, who was also a member of the New York Life's finance committee. The indictments contained six counts each charging forgery in the third degree. They were based on what is known as the Prussian bond transaction, in which it is charged that a false statement was made by the New York Life Insurance Company in order to satisfy the Government of Prussia as to the securities held by the company. Conviction on the charges covered by the indictments carries a prison sentence with no alternative of fine. The grand jury accompanied its indictments with a presentment in which it was made a matter of record that its belief was that the two defendants, in committing the acts charged, were solely influenced by a desire to benefit the policy-holders of the New York Life and did not themselves benefit by the acts charged. The crime is a serious one, but we hope it will not be difficult for the gentlemen in question, both of whom have stood high in business and social circles, to clear themselves of any criminal intent or offense. But if they are guilty they should unquestionably be made to suffer. The Independent has no wish to indorse the popular cry of the yellow journals that "a millionaire must be jailed," for we have no desire to have these men punished as an act of public vengeance. Doubtless they would both be moved to act differently today, if placed in the same position again regarding such a thing as the Prussian bond transaction. But the lessons of the recent scandals do not yet seem to have been entirely learned, at least not in certain high places, and it almost seems as if the fear of the jail was the only remaining deterrent thing. A legal conviction of men like these for a crime committed would be an incalculable force tending toward the better observance both of law and order on the part of others in commanding positions all over this broad land.

Insurance Against Unemployment

The statistical department of the Berlin Home Office has now published a three-volume report following its general inquiry into the subject of insurance against unemployment as now existing in various parts of Europe. Governmental aid in a financial way is extended to the unemployed benefit funds and otherwise in France, Norway, Belgium, Switzerland, Italy and Germany. In most cases the efforts of the governments in this direction are directed less toward the provision of relief than to stimulate self help. Switzerland is the only country in which the experiment of compulsory unemployment insurance has yet been tried, and the Swiss experiment was not entirely successful.

George Burnham, Jr., counsel and vice-president of the Mutual Reserve Fund Life Insurance Company, who was convicted of grand larceny, was sentenced week before last to serve two years in State's prison. The maximum penalty for grand larceny is ten years. The trial of Frederick A. Burnham, brother of the convicted man and president of the Mutual Reserve, and of George D. Eldridge, the company's vice-president, will shortly follow.

The Metropolitan Life Insurance Company, which has hitherto carried risks on negro policy-holders aggregating more than a million dollars, has issued instructions to its agents that on and after January 1st, 1907, they are to decline applications for insurance from such risks. "The increased death rate among the negroes" is the alleged cause for this action on the part of the Metropolitan Company. The Prudential Company has had a similar policy regarding the insurance of negroes for some time past, and if this company accepts them for large policies premiums are charged that are much in excess of those exacted from their white-skinned brethren.

Financial

The Year's Railway Cars

FIGURES showing the past year's output of railway cars are interesting, in view of the "car famine" of the last few weeks. It appears that the number of cars manufactured in 1906 was greater by 45 per cent. than the number made in 1905. The following table, compiled from the returns of the *Railway Gazette*, shows the totals for three years, together with the number of new locomotives and the annual additions of railway track, in miles:

	Freight Cars.	Passenger Cars.	Locomotives.	Mileage.
1906.....	240,503	3,167	6,952	5,623
1905.....	165,455	2,550	5,491	4,388
1904.....	60,806	2,144	3,441	3,832

Cars and locomotives built in railroad companies' shops are not included. It is the opinion of the General Superintendent of the Pennsylvania road that current necessities demand an annual output of at least 270,000 freight cars. According to the figures given above, it appears that the companies paid last year about $375,000,000 for cars and locomotives constructed outside of their own shops, and that the payments for freight cars exceeded $250,000,000.

President Cassatt

A. J. Cassatt, who died suddenly on the 28th ult. of heart disease, was one of the best equipped and most efficient of American railroad men. Having been carefully educated as an engineer, he rose from the humble work of a rodman to supreme control of the great Pennsylvania system, having gained experience and shown his ability in many responsible offices on his way to the highest place. His exceptional foresight was exhibited in projecting the very extensive and costly improvements which have drawn public attention to the management of the road in the last few years. It was in his relation to recent railway legislation and investigations that Mr. Cassatt was regarded with interest by the general public. He did not oppose the President's railway policy, but was largely in sympathy with him on this subject, and gave him assistance. One purpose of the Pennsylvania's acquisition of virtual control of the Baltimore & Ohio and two other competing roads was to avoid what seemed to some to be a necessity for discrimination in rates. Recent sales of the greater part of the Pennsylvania's holdings of the stock of these roads may indicate a conviction that under the new conditions no such defense against the demands of influential shippers is required. It may be recalled that at the end of the investigation, last year, as to the interest of the company's officers and employees in favored coal companies, it was quite conclusively shown that President Cassatt himself had a clean record. But the disclosures made as to the offenses of his subordinates, affecting, as they did, the great company's good name thruout the world, undoubtedly hastened his death, if they did not cause it.

....In a published letter concerning the currency, Julian D. Fairchild, president of the Kings County Trust Company, of Brooklyn, says:

"In its annual collection of more than $265,000,000 of customs duties, the Government necessarily becomes an important factor in the country's business. There is no more excuse for the Government locking up this vast sum than there would be for any business man to do so. These collections should be promptly deposited in the National banks and should draw interest, which should be kept in a separate fund as an insurance against loss."

Undoubtedly, Congress at its present session should put an end to this locking up of customs receipts of which Mr. Fairchild speaks.

....The number of new textile mills built in 1906 was 303, or 58 more than were erected in 1905. About 60 per cent. of the new spindle capacity is in the South.

....The Union Bank of Brooklyn, of which David A. Sullivan is president, has bought control of the Mechanics and Traders' Bank of New York, of which W. L. Moyer is president.

....The $7,000,000 of three and five year five per cent. notes recently issued by the New York, New Haven & Hartford Railroad Company have all been sold by Lee, Higginson & Co., of Boston, and Hornblower & Weeks, of Boston and New York.

The Independent

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The Employers' Liability Law

Two recent decisions concerning the new Employers' Liability law excite much interest, owing partly to the question whether, if sustained on appeal, they may not be used hereafter effectively against parts of the Meat Inspection and Pure Food laws. At Louisville, on the 31st ult., Judge Walter Evans, of the United States District Court, decided that the Employers' Liability act, of June last, was unconstitutional, upon the ground that it did not "regulate commerce between the States." The case was one in which the widow of one Brooks, who had been killed on the railroad, sued the Southern Pacific for $25,000 in damages. Judge Evans said:

"A most patient consideration of the question in this instance has led to the conclusion—we think to the inevitable conclusion—that the act of June 11th, 1906, only creates and imposes liability upon certain common carriers to their employees, and in no way prescribes rules for carrying on traffic or commerce among the States, and consequently in no way regulates such commerce. If the operation of this act could in any way affect commerce among the States it would do so in a manner so remote, incidental and contingent as in no proper sense to afford a factor of any value in determining the question now in contention. Indeed, it may be said that it is obvious that Congress, in the act referred to, had in contemplation no more than the creation of the liability mentioned, and it would be a most strained construction to hold that it included anything broader than that. Creating new liabilities growing out of the relations of master and servant on the one hand, and regulating commerce on the other, are two things so entirely different that confusion of the judicial mind upon them is hardly to be expected under normal conditions."

He also remarked that the Attorney-General, "conceiving, we suppose, that the United States had some interest in the case," had sent one of his assistants to intervene in behalf of the Government. Altho, he continued, it was difficult to see that the United States was concerned, he had heard the assistant as "a friend of the court." Judge Evans is the judge to whom Mr. Roosevelt referred in his recent message, when, arguing that the Government should have the right of appeal in criminal cases on questions of law, he said:

"I have specifically in view a recent decision by a District judge leaving railway employees without remedy for violation of a certain so called labor statute. It seems an absurdity to permit a single District judge, against what may be the judgment of an immense majority of his colleagues on the bench, to declare a law solemnly enacted by the Congress to be 'unconstitutional,' and then to deny to the Government the right to have the Supreme Court definitely decide the question."

In that first decision, Judge Evans, in the case of a member of the telegraphers' union against the Louisville & Nashville road, held to be unconstitutional a law some ten years old forbidding common carriers engaged in interstate commerce to exact from an employee an agreement that he would not enter a union, or to discriminate against an employee because of his connection with a union. Judge Evans was appointed by President McKinley.——On the 1st inst., at Memphis, Judge John E. McCall, of the United States District Court in Kentucky, also decided that the same Employers' Liability law was unconstitutional, the case being one in which Mrs. D. Howard sued the Illinois Central company for $25,000 in damages on account of the loss of her husband, who had been killed in the

service of that company. This judge (who was appointed by Mr. Roosevelt) said:

"I am unable to bring my mind to the conclusion that the liability of a common carrier to its employees for injuries is interstate commerce or commerce of any character within the meaning of the commerce clause of the Constitution. My conclusion is that Congress is not authorized under that clause to enact this legislation, for the reason that the relation of common carriers engaged in interstate trade or commerce to their employees, and their liability to them in damages for injuries sustained in their employment as the result of the negligence of any of its officers, agents or employees or by reason of any defects or insufficiency due to its negligence in its cars, engines, appliances, machinery, track, roadbed, way or works, is not commerce within the meaning of the Constitution. But if it were, the act does not undertake to regulate this relation or liability, but simply announces a new law on torts, limited to a special class of those engaged in interstate commerce."

The law in question, whose provisions concerning liability are summarized in this extract from Judge McCall's opinion, was advocated by Mr. Roosevelt in his messages of 1904 and 1905. In his recent message he said that it did not go far enough, but should be so amended that it would place the entire "risk of a trade" upon the employer. Appeals from the decisions will be taken, and the Department of Justice will be represented in the arguments before the Supreme Court. The decisions have some bearing upon proposed Federal legislation concerning the hours of railway employees and the transportation of the products of child labor.——Both the judges have been Republicans in politics. Judge Evans, in his opinion, made some remarks which are regarded as being in opposition to the policy of the Administration, as that policy has been set forth in the President's messages and Secretary Root's speeches. While the necessity of giving broad latitude to the commerce clause, he said, had been wisely and inevitably forced upon the courts by the tide of advancing events, it might be that the clause's elasticity should be limited, and it might not be an unmixed evil for some of the people now, "as was once the habit," to call for a strict construction of the Constitution:

"If such call served no other purpose, it might be useful as the occasional hoisting of a cautionary danger signal. As our Government was organized and has greatly prospered under a system of checks and balances, possibly it might be well once in a while to remember that those checks and balances yet remain, even if calling attention to the fact be a somewhat old-fashioned habit."

Standard Oil Indictments

At Chicago, on the 3d, Judge Landis overruled the defendant's demurrers as to eight indictments against the Standard Oil Company for accepting rebates or unlawful rates on the railways, and sustained the demurrers as to two indictments, owing to technical defects in them. In the indictments which were sustained there are 6,293 counts. If the company should be convicted on all of these counts, the law would permit the imposition of $125,860,000 in fines. Judge Landis in his decision rejected, of course, the somewhat ingenious plea of the defendant's counsel that no law against rebating or the acceptance of special low rates was in force on August 27th, when the indictments were found. This plea was, in substance, that the Elkins law was repealed upon the approval of the new Rate law (on June 29th), and was not re-enacted by the joint resolution of June 30th, which provided that the Rate law should not become operative for sixty days after approval, or until August 28th.——Several railroad companies are to be prosecuted for violation of the laws which forbid detention of cattle in cars for more than twenty-eight hours without feed or water.——The New York Central and Pennsylvania roads have ceased to advertise in the New York papers the hours of the departure of their trains.——The Commission's first decision under the new law relates to a freight charge for carrying bricks on the Pennsylvania road. The charge is held to be unreasonable and unjust. A reduction of 25 per cent. has been made by the company.

The Harriman Railroads

During the first two days of the Interstate Commerce Commission's investigation of what are called the Harriman railroads some interesting facts were brought out. Mr. Harriman is ill and could not attend; the witnesses were Secretary Millar and Comptroller Mehl.

The main part of the combination or group consists of the Union Pacific, Southern Pacific, Oregon Short Line and Oregon Railway & Navigation companies, whose stock and bonds amount to about $1,250,000,000. Control of the Chicago & Alton is shared with the Rock Island, and large interests in several other prominent roads have been acquired by purchase. The combination controls the Pacific Mail and two other transpacific steamship lines, and the old Morgan line from New York to New Orleans. Mr. Harriman and his friends own half of Senator Clark's new road from Salt Lake City to the Pacific, and both interests in this property are tied up by a trust agreement. There is also a contract between the Clerk road and the Southern Pacific, under the terms of which the rates on the Clark road cannot, for ninety-nine years, be changed without the Southern Pacific's consent. It was disclosed that, since June 30th last, the Union Pacific had bought $103,168,745 worth of railroad stocks as follows: Baltimore & Ohio, nearly $40,000,000; Illinois Central, $28,123,100; New York Central, $14,285,745; Atchison, $10,000,000 (Mr. Harriman and his friends already, it is said, holding $40,000,000); St. Joseph & Grand Island, nearly $6,000,000; St. Paul, $3,690,000; Northwestern, $2,572,000. It was not clearly ascertained where the money for these purchases was obtained, but it was shown that Mr. Harriman had practically unlimited power to borrow on his companies's securities. There were indications that the entire field between the Mississippi and the Pacific, except Mr. Hill's territory, was controlled directly or by stock interests. The Gould system, hemmed in on the Pacific side, is making a new outlet for itself. The evidence appears to involve the control of parallel and naturally competing lines. It was shown that in March, 1903, the Oregon Short Line sold to William Rockefeller, a director of the Union Pacific, 300,000 of its 900,000 shares of Southern Pacific for $17,250,000, and bought them back on November 12th of the same year, paying him 6 per cent. on the money and a commission of $187,000. This transaction was not explained, but probably it was related to the attack upon Southern Pacific by James R. Keene, when he urged the declaration of a dividend in the interest of a large speculative pool in Southern Pacific stock. The official record of board meetings showed that the decision in August last, to increase greatly the Union Pacific dividend, was withheld from the public for two days, having been made on the 15th. The announcement of it, on the 17th, was both preceded and followed by large purchases and a notable advance of prices. It was reported at the time that great profits had been taken by persons who had knowledge of the decision before it was given to the world. There was abundant evidence that Mr. Harriman's power has practically been subject to no official restraint. As President and as chairman of the executive committee he appears to have been its first and final authority in great transactions, involving enormous purchases and great projects.

As to Chinese for Canal Work

A newspaper correspondent accompanying the California members of Congress who went to the Isthmus, asserted in his dispatches, on the 1st, that Chinese would not be employed in making the canal. He had been so informed, he said, by Jackson White, who has charge of the employment of labor, and who had explained that plans for the use of Chinese had been abandoned, because Spanish and Portuguese laborers were arriving in considerable numbers. Chairman Shonts said to the Associated Press on the 2d that no decision on this subject had been reached, and that none would be made until after a disposition of the canal contracts. In special dispatches of the same date, however, there was ascribed to him the statement that probably it would not be necessary to employ Chinese, owing to the increasing supply of Spaniards and Portuguese, and that Chinese would be used only as a last resort, if the number of available and satisfactory workmen of other races should be insufficient.

Politics and Washington Topics

Simon Guggenheim, of Denver, has been nominated by the Republican members of the Colorado Legislature to succeed Thomas M. Patterson in the United States Senate on March

4th, receiving sixty-eight of the seventy Republican votes. Senator Alexander opposed the nomination, saying it would "place in the Senate one more vote to fight against the brave man in the White House who is battling for the people's rights." Mr. Guggenheim is a member of the wealthy family which controls the American Smelting and Refining Company, sometimes called the Smelting Trust. He is thirty-nine years old. It has been asserted, without denial (so far as we can learn), that he "financed" the recent Republican legislative campaign in Colorado.——Four Republican members of the New Jersey Legislature have published a signed statement asking that the name of Senator Dryden, as a candidate for another term, be withdrawn. It is thought that this will prevent his re-election, as he needs forty-one votes, and the withdrawal of these men leaves only forty Republicans.——Mr. Carnegie has contributed $750,000 toward the cost of erecting in Washington a building that shall be the permanent home of the Bureau of the American Republics. In a letter to him, the President says:

"You have already done substantially the same thing for the cause of peace at The Hague. This new gift of yours has an almost or quite equal significance as far as the cause of peace in the Western Hemisphere is concerned, for the Bureau of American Republics is striving to accomplish for this hemisphere what The Hague Peace Tribunal is striving to accomplish for both hemispheres."

For the proposed building a fund of $1,004,000 is now available, Congress having appropriated $200,000.——An amendment to the Foraker resolution (for an investigation of the dismissal of the negro soldiers), offered by Mr. Lodge, is of such a character that the Senate will first vote upon the question whether the President's action was taken "in the exercise of his legal and constitutional authority as commander-in-chief" of the army. A vote in the affirmative would probably prevent any investigation.——One of the four negro regiments is now in the Philippines. The remaining three are now to be sent to the islands.——Among those recently convicted of fraud and subornation of perjury in a land case in Nebraska was Bartlett Richards, president of the American Cattle Growers' Association. Twenty-one more indictments, involving forty persons, are still to be tried at Omaha. By direction of the President, notice has been given that the law against the fencing of public lands will be rigidly enforced after April 1st.——It is understood that the Department of Justice will file in San Francisco a bill in equity asking the court to enforce the provisions of the treaty with Japan, and asserting that the segregation of Japanese school children was a violation of that treaty.

Typhoid Epidemics in Pennsylvania

There have been 981 cases of typhoid fever, with 79 deaths, in Scranton, Pa., a city of 120,000 people, since December 1st. The public hospitals are crowded with patients, and an emergency hospital has been made in an armory. In the neighboring village of Dunmore there are more than 50 cases, and many are reported in other adjoining towns. There has been much suffering in Scranton, and pathetic stories are told of the stricken families. It has been proved by the health authorities of the State that the cause of this epidemic is the pollution of the water supply, the germs of typhoid having been found in the reservoirs and the streams which flow into them. These streams receive the sewage of at least one village and several scattered houses.——In Pittsburg, there are more than 1,000 cases of typhoid. Last year, there were 5,575 in the city, with nearly 400 deaths. Pittsburg takes its water from the Allegheny River, into which, at points above the intake, sewage is discharged from several smaller cities which have typhoid epidemics of their own. Philadelphia has many cases of the fever. Last week, 253 new ones were reported, and there were several hundred typhoid patients in the hospitals.

Railway Accidents

Owing to the great loss of life in recent collisions on railways, the Interstate Commerce Commission has begun an investigation concerning the block system. The immediate cause of this inquiry was a collision at Terra Cotta, on the Baltimore & Ohio road, three miles from Washington,

early in the evening of December 30th, when a train of empty cars, moving at the rate of sixty miles an hour, struck the rear end of a crowded passenger train which had just started to leave the station. Fifty-eight of the passengers were killed. The hour was 6:30, there was a dense fog, and the train of empty cars ran by a danger signal of the block system. It appears that the engineer had been on duty continuously for thirty-three hours, and in forty-eight hours had had only eight hours of sleep. The wrecked train was one running between Frederick and Washington on Sundays for the accommodation of suburban residents and holiday excursionists. James J. Hill, the well known railway president, says "it is a fact that in these days from two to three trains enter at times into every block of every system in the country." ——On the 2d, at Volland, Kan., two Rock Island passenger trains met in collision, and forty-nine persons were killed. All but two of these were Mexican laborers riding in one of the smoking cars. This accident appears to have been due to the neglect of a telegraph operator eighteen years old, who held a position of much responsibility.

The French Government and the Church

The cutting off of the pensions to the clergy, which the Separation Law granted in lieu of salaries and which has been withdrawn on account of the refusal of the Catholics to comply with the requirements of the law, has placed the poor parish priests in a distressing position. They are mostly men devoted to good works who have taken no part in the political struggle and they have loyally obeyed orders from the Vatican in refusing any compromise with the Government Several sources are relied upon to furnish the funds necessary to replace the Government subventions which the Church received under the Concordat. Appeals have been issued to the faithful in France to contribute liberally and regularly to the support of the Church and it is expected that Catholics in other countries, especially England, will come to the rescue. It is also reported that the Vatican will contribute largely from its funds in this emergency, since the economical régime of the present Pope has resulted in great savings to the Vatican treasury. Cardinal Richard, Archbishop of Paris, appeals to the people of Paris in the following terms:

"The spoliation of the Church in France will soon be complete. The Government has repudiated its sacred obligation by suppressing the public worship budget. The small recompense which is accorded will not pay for what is owing to the clergy for the property seized during the revolution. The Bishops and priests have been driven from their homes, and, as if this were not enough, they have stripped the Church of all the property received owing to the liberality of the faithful during the past century. The property of the wardens, pious endowments, seminaries, rectories, and even the funds of the aged and infirm clergy are today sequestered and tomorrow will be confiscated. We protest against this action in the name of the Church and of the elementary principles of justice. It must not be forgotten that the Church was born and grew great in poverty, and that it attaches no importance to the possession of material goods. This is proved by the fact that it has surrendered everything rather than submit to an organization contrary to the principles of the divine constitution and spiritual independence. Nevertheless, in order to accomplish its mission in glorifying God and saving souls, temporal resources to insure the exercise of public worship and to support the clergy are necessary. Therefore there is no recourse except to appeal to the generosity of the faithful."

So far very few of the churches have actually been closed, and services have been continued with almost their usual regularity, fines of a few francs being inflicted for technical violation of the law relating to public meetings. In some parishes an association of three laymen has been formed under the authorization of the clergy, which, according to the law of 1901, will secure church services from interference by the Government. It is expected, however, that even this form of compliance with the law will be forbidden by the Pope. An assembly of the bishops of France will be held on January 15th at the Château de la Muette for the purpose of discussing this and other questions. There are many rumors of schismatic movements, but none of these seem to be of any importance. In the town of Arbellara, Corsica, the curé who refused to comply with the law was deposed by the municipality and an invitation extended to Don Paolo Miraglia, Bishop and Founder of the Reform

Church of Italy, to come to Corsica and ordain a new curé. This plan was carried out in spite of the threat of excommunication issued by the bishop against all concerned.——The documents which were seized at the Papal nunciature at Paris may be published by the Government. The Vatican protests against this violation of international usage by the publication of diplomatic correspondence, and points out that isolated documents apart from the context may be very misleading, and that there is no way of determining whether the documents purporting to come from these archives are genuine or forged. ——The Government is carrying out several reforms of importance in morals and education. The Premier Clemenceau has ordered the suppression of all clubs at which gambling of both sexes is permitted. Vendors of obscene photographs and books have been driven from the streets. The new Sunday law is generally and strictly enforced, and has has made a marked change in the "Continental Sabbath." Minister of Education Briand proposes to suppress the baccalaureate or bachelor's degree. The examination for this is imposed upon all boys entering a French university and the necessity of passing this examination is one of the main causes of the defects of French education, its uniformity and insistence upon routine study and memorizing.

The German Election Campaign

It has been many years since Germany has had so exciting a campaign as that for members of the Reichstag who are to be elected January 25th. All parties are thrown into confusion by the sudden change in the tactics of the Government in repudiating the Center and appealing to the Liberals for support, and by the necessity for a rapid realignment on new and vaguely defined issues. Chancellor von Bülow has explained the objects of the Government in dissolving the Reichstag in a letter to Lieutenant-General von Liebert, chairman of the Executive Committee of the Empire League, which was formed to check the growing power of the Socialists. The Chancellor recommends that a union be formed of the Liberals and Conservatives to "fight for the honor and prosperity of the nation against the Social Democrats, Poles, Guelphs and Centrists." He admits that the Government has for the last three years been dependent on the Catholic Center, and without its aid would not have been able to carry out its financial reforms and to secure the new commercial treaties and the increase in the navy. But when the Clericals, combining with the Social Democrats, opposed the colonial appropriations it became necessary to free the Government from its dependence upon them. He hoped that the Liberals and Conservatives would increase their representation in the Reichstag so they could successfully oppose both reactionary Clericalism and destructive Socialism. The latter he also held to be really reactionary in its tendency.

"Not only are its communistic dreams of the future hostile to civilization, but so are its means for realizing them by mere brute force. Any tendency toward reaction to be found anywhere in Germany is due to the Socialists undermining the popular conceptions of authority, property, religion, and the Fatherland. The sword of Bonaparte followed Robespierre —the simple citizen who became mad drunk with the doctrines of 'liberty, equality, and fraternity.' Bonaparte had to come and free the French people from the terrorism of the Jacobins and Communists."

The Chancellor's manifesto does not seem to have had the effect he desired. Both the Liberals and Conservatives resent the suggestion of uniting to furnish the Government with a majority to carry out policies of which they disapprove. Some of the more radical members of the Liberal party advocate an alliance with the Social Democrats rather than with the Conservatives. Conservative leaders say that they will support the candidates of the Center instead of those of the Liberal party in places where they cannot elect their own men. It is reported from Cape Town that the Hereros of German Southwest Africa, who for the last three years have been at war with the Germans and forced the Government to the enormous expenditures that brought on the present crisis, have signed a treaty of peace, so the Government will not need such large appropriations as it asked for from the late Reichstag. The Government has

announced that the electoral system of Prussia will be reformed in accordance with the plan advocated by the Liberals, that is, direct voting for members of the Prussian Diet will take the place of the present method of voting for electors. This will not affect the representation in the Reichstag, but will permit the Socialists to have representation in the Diet from which the present system debars them.

Russian Conditions

Just before the meeting of the last Duma the Czar issued a ukase greatly restricting its jurisdiction. He is pursuing the same policy in regard to the new Duma, reorganizing the administration so that he becomes the President of the Council of Imperial Defense, and the Ministries of the Army and Navy are abolished. The Duma, therefore, even if it is able to control the actions of the ministers, will have no power in military and naval affairs. This is a severe blow to popular government, because of the important part which the military system plays in Russian affairs, even in time of peace. The Czar has the power of placing any district under military control, and by courts-martial, which are not subject to revision by the civil authorities, any number of individuals can be summarily exiled, imprisoned, flogged or executed. Every effort is being made by the Government to prevent the radical element of the population from controlling the Duma. According to the new regulations governing the elections, no ballot paper will be valid without the stamp of the town council. The authorized political parties are furnished with an unlimited number of these ballot papers on which they can have the names of the candidates printed in advance, but this privilege is not accorded to unauthorized parties. The Constitutional Democrats, who formed a large majority of the last Duma, are now held to be a revolutionary organization because of the Viborg manifesto advocating passive resistance. Accordingly, any man wishing to vote this or any other opposition ticket will have to write the names of about eighteen candidates on the sheet of paper furnished him at the polls.—— General von der Launitz, Prefect of Police, St. Petersburg, was assassinated on January 3d by a revolutionist. He was assisting in the inauguration of a new hospital when a young man fired two shots at him, both taking effect in his brain and causing instant death. The assassin was immediately killed by the sword of an aide-de-camp. Launitz had been very active and vigilant in ferreting out revolutionary organizations and in suppressing political meetings. The assassin has not yet been identified. At the funeral services of the murdered Prefect a man disguised as an officer of the army attempted to gain admittance to the church, presumably for the purpose of killing Premier Stolypin, but he was arrested by the police. Annikin, leader of the Group of Toil in the Duma, is dead from an illness caused by the privations of his terms of imprisonment and exile. Rear-Admiral Nebogatoff and other officers who have been tried for surrendering the squadron to the Japanese in the battle of the Sea of Japan on May 28th were sentenced to death in accordance with Russian law. It is expected that the Emperor will commute their sentences to imprisonment in fortresses for ten years and shorter terms. At a recent conference of the leading officers of the navy the Emperor discussed with great frankness the corruption and inefficiency which had caused the defeat of the Russian navy by Japan, and expressed his determination to reorganize an efficient sea force.

Raisuli Defeated

The Moroccan Government, finally forced by the foreign Powers to take action against the bandit Raisuli, has been successful, at least in so far as driving him with his followers from his village stronghold of Zinat constitutes success. It has been known to the foreign residents in Tangier for some time that the tribesmen were being aroused to a high pitch of religious and patriotic fanaticism, and Raisuli was reported to have boasted that he had 15,000 armed Moors under his command, with whom he would drive every Christian into the sea. Raisuli, however, denied that he was responsible for the agitation among the natives, and promised that he would not interfere with the introductions of the reforms recommended by the Convention of Algeciras

if his own safety was secured and the sultan's troops prevented from approaching his district. No attention was paid to this effort at coming to terms, and the Shereefian army of 5,000 men, under the command of Sid Mohammed Gabbas, Minister of War, and Kaid Maclean, Commander of the Sultan's Bodyguard, encamped near Tangier and prepared for an attack on Zinat. The first attack, made on January 5, according to the report of Mr. Harris, correspondent of the London *Times,* who followed the troops contrary to orders in the disguise of a trooper of the Moorish irregular cavalry, was a complete failure. Raisuli's men occupied a strong position at the foot of a precipice and overlooking the approaching plain, and from the rocks and buildings they maintained such a heavy fire that the Moorish troops were compelled to retreat. On the following morning, when the attack was recommenced, very little resistance was offered, and when the stronghold was carried it was found to be deserted. Raisuli with 700 men had succeeded in effecting his escape into the mountains, in spite of the fact that his position was supposed to have been surrounded by the Moorish troops. A large amount of booty, such as costly carpets, arms, cattle and sheep, was found in Zinat. In the Sultan's forces four men were killed, and in Raisuli's nine. The Government artillery was under the command of an Algerian lieutenant from the French army. The capture of the stronghold is, of course, of little importance to a nomad chieftain, but the defeat may have injured Raisuli's prestige among the tribes, so that he no longer will be a dangerous factor in the Moroccan situation.

The Religious Events of the Year

Abroad, the conflict between the Vatican and France has been the chief religious event, but it is as much political as religious. The spirit of individual Gallicanism shows very little evidence among the bishops, but the laity seem restive under papal control. There is a succession of books representing liberal Catholism which have much influence. The Abbé Loisy is still under censure and in his ill health has retired from contest. The great problem before the Catholic Church is how to maintain its clergy and church worship when the subventions from the state are wholly withdrawn.——In Great Britain religion and politics have been equally complicated. The Welsh revival has past its culmination, and is not a special feature this winter.——In Russia relief is promised to the Jews. In this country there has been two religious events of great importance. One is the agreement of the representatives of the Congregational, United Brethren and Methodist Protestant denominations on a tentative plan of corporate union. A plan first agreed upon, at the large council of the three bodies, has been perfected, and will be acted upon at a meeting in February. The other is the final union of the Northern Presbyterian and the Cumberland Presbyterian Church. Similar negotiations for a union of the Presbyterians, Methodists and Congregationalists in Canada have proceeded satisfactorily.——There has been one heresy trial of some importance, that of Dr. A. S. Crapsey, in the Episcopal Church. He was condemned for failure to hold correctly the doctrine of the creeds as to the virgin birth of our Lord and his physical resurrection. The result was Dr. Crapsey's withdrawal from the Church.——An interesting conflict in the Southern Methodist Church over the control of Vanderbilt University has been carried a step further by a report of a committee of jurists of that Church, the question being as to the ownership and control of its property and the right of all the bishops to a seat in the Board of Trustees.——The fall of Dr. Dowie from the control of his Zion Church in Zion City has been tragic. His wife and son have forsaken him, and Mr. Voliva, brought by him from Australia, has become the leader, and the finances of Zion City seem hopeless. Dr. Dowie's own health is sadly impaired.——The Christian Scientists have built a magnificent million-dollar temple in Boston, and there has been much discussion as to Mrs. Eddy's health, and a vigorous attack is being made on her record, but her followers are enthusiastically loyal.

Confessions of an Undistinguished Heretic

[The author of this highly significant and timely article is an ordained clergyman of a large and orthodox denomination, a church which has expelled ministers for smaller heresies than are confessed in the article. He has been the pastor of important churches in progressive cities and is still in active service. He raises a number of interesting and important points. Some of our readers may wish to comment on the article or give some of their experiences. We may be glad to publish a few brief letters on the subject.—EDITOR.]

I HAVE never won distinction by my heresy, nor even acquired a local reputation for violent departures from orthodoxy. If I should set about some Sunday morning to tell my congregation all my divergences from accepted Christian belief I would shock them beyond measure. They understand in a general way that I am a liberally-minded parson, and I take occasion not infrequently to hasten their heels in their movement from worn-out dogma to the truth that is to be. That they are engaged in such a journey I have not a doubt, and most of them are willing to maintain a reasonable pace. My congregation is above normal in intelligence, information and sympathy with forward movements, but nevertheless I am fully persuaded that a complete revelation on my part of the beliefs to which my studies have forced me would set their ears a-tingling, and not only awaken antagonism to me personally, but also cause a turn of sentiment in the direction of conservatism and orthodoxy.

Many years ago, when I first began to preach, I took out my pen of a Monday morning, after certain troublous saints of the older sort had been nagging me to "preach the simple gospel," and thus delivered my soul of its burden:

"I do not believe in a limited atonement. It is to me inconsistent with a *bona fide* offer of salvation to all men, and further, I do not think Christ's death should be measured as to value or efficiency, as one might number a culprit's stripes.

"As I have heard it explained, I cannot believe in imputed righteousness, that Christ stored up an extra quantity of goodness which can be transferred to others.

"God can forgive sin without punishment. Christ's death did not change God's disposition, did not appease or propitiate Him, in any fair use of those words. Law is not immutable, nor is punishment inevitable."

I remember my mingled feelings as I hid that paper in my desk—first wonder that I had been so bold, then fear that I was in error and that I might be visited upon by heaven for awful sin, but at last conviction that I had put down truth and freed myself from the weight of an unworthy dogma. I would not have dared to read my declarations from the pulpit. Strange as it may seem today, limited atonement and imputed righteousness were live questions not so many years ago, and full confession on these topics would have meant for me dismissal as a discredited and "dangerous" man from a parish to which I was well fitted, and very likely it would have ended in my withdrawal from the ministry.

Yet such is the rapid advance in religious opinion, at least as I experience it in my parish, that I would not hesitate for a moment now to give fullest utterance to views utterly condemnatory of the whole scheme of sacrificial atonement and imputed righteousness. Indeed, I have made recently declarations similar to those I have quoted, and so far from stirring resentment they have hardly kept the congregation awake. Devout saints who were wont to inquire anxiously why I did not mention that "Christ made full atonement for our sins" every week or two, after a sermon on any subject from Dan to Beersheba, now sit patiently under preaching which never refers to Christ as a propitiatory sacrifice. I do not observe that they gossip about their neighbors any more than they used to, nor that they are any the less generous

and sweet spirited; certainly their prayers are still devout and edifying, tho the vocabulary may have slightly changed. Doubtless they are not conscious of any radical change of attitude toward religious questions, and possibly if called upon to define their creed on the death of Christ and atonement for sin they would make use of the formularies they learned in their youth. I am not much concerned how they would declare their faith in a theological examination, but it is a matter of great moment to me that I have proved that with patience, tact and perseverance an assembly of intelligent pious folk can be weaned from a diet of substitionary atonement and scriptural infallibility, and nourished by doctrines in harmony with the best knowledge of the times, and that without noticeable diminution of true piety or of the comforts and consolations of religion.

Experience has thus taught me not to be too rampant with my heresies. I have learned that if one keep his doctrinal discoveries in his study drawer for about five years, taking them out now and then to refresh his soul, allowing occasionally a delicate effluence from them to steal over a page or two of the next Sunday's sermon, he will find at the end of the period that he may avow them as violently as he pleases, and they who aforetime would have lit the torch for his burning will sit peaceably under his doctrine, and sing the last hymn lustily in satisfaction that they have heard once more truth they have always believed.

For this reason I am not shouting out every Sunday that I do not believe in the virgin birth of Jesus nor in the physical resurrection. Much as I honor and admire Dr. Crapsey, I am not scurrying to put myself in the pillory beside him. I let others do the talking, answer questions cautiously, try to tell about Jesus in such manner that those whom I influence will not care how he was born, and endeavor to declare eternal life in terms that lift the whole subject above the plane of a discussion about the reanimation of a dead body. When I have built my temple of truth, I will knock down the scaffolding which helped to its erection, doubtless sending the beams a-flying with no little feeling for that they have disfigured the temple so long. But while many good souls for whom Almighty God has made me in a measure responsible cannot see how the building would stand except for the scaffolding, I will let the rude timbers remain in place.

As a matter of fact it has become very clear to me that the story of the virgin birth is but a form in which a legend-loving age confessed its faith in the divine worth of Jesus of Nazareth. Men did not believe in Jesus because they supposed he was miraculously born, but they thought he must have been of extraordinary origin to have been such a man as he was. I agree unreservedly and joyously with the estimate which the hearts of the poets of the early chapters of Matthew and Luke placed upon their Master. I feel toward the Nazarene as they did, and my soul lives under the spell of his influence, as did theirs, and I believe, therefore, that I cherish their faith and am as well entitled to be called a Christian. But to the historical accuracy of the infancy narratives I demur. It is very evident that the gospels are not four independent writings by four painstaking historians. They are compilations, in which separate literary sources are plainly discoverable. It is no longer theory or hypothesis, but established historical fact, that Mark is the earliest gospel, from which Matthew and Luke copied at great length. It is also established that there was another document which both Matthew and Luke used, consisting largely of sayings and addresses of Jesus. In addition to these two principal authorities, both the first and third evangelists availed themselves of material which they alone have preserved. The fourth gospel is admittedly much later than the others, and is not a record of what Jesus said and did, but an interpretation of his person in terms of the thought of disciples who lived three-quarters of a century after Jesus was put to death.

Now in my boyhood I was taught to place all four gospels side by side, to take the outline of a parable or an incident from the simplest account, then to see what added information was supplied by other evangelists. Details and enlargements found only in Luke or John were

regarded as so much more established knowledge. But revelation of the literary structure of these books has made this method impossible. There are but two prime sources of information concerning the deeds and words of Jesus, namely, the gospel of Mark, and the collection of speeches preserved in Matthew and Luke. Where Matthew has copied from Mark, the additional material in his narrative is not reliable "added information," but embellishment, possibly true, but to be carefully examined. It is true that the evangelic record, as begun by Mark and completed by John, grew in part by collection of trustworthy material, but once one's eyes are opened to the fact that the story concerning Jesus was a thing of growth, that it expanded under the hands of those who loved and worshiped him, then it becomes plain that accretion of well-intended imagination has shared at least with zeal for further fact in the expansion of the gospel history.

It requires no knowledge of Greek to see for one's self that the rending of the heavens and the descent of a dove at the baptism, which in Mark are purely a vision in the soul of Jesus, are transformed in Luke into an outward event; that the simple fact of solitary struggle in the wilderness, as Mark relates it, becomes in Matthew and Luke a legendary dialog with Satan; that the reference to the preaching of Jonah, as Luke has preserved it in its original form, has become in the hands of Matthew a prophecy of the resurrection. There can be no question but that the simpler narrative has the right in each of these three cases. All history of ancient times is constructed today by sifting traditions and discarding pious additions included in the story in order to interest and edify, and the gospels must yield themselves to this method of treatment.

Once this is admitted and one fully realizes what it means that the four gospels are literary compilations, with a history which can be traced, then the story of the virgin birth has lost the foundation on which it stands. In the earliest gospel not a word is said of it. Only Matthew and Luke are sponsors for it, and they do not follow one clear testimony. Matthew includes the story in a framework of Old Testaments texts, which one must suspect to be the real basis of the story. The third evangelist betrays free literary construction by the prominence given to angels, and by the poems, most beautiful and devout but precisely alike in style, which all the characters compose. Moreover the account of the miraculous birth is neutralized by the genealogies which both in Matthew and Luke trace the descent of Jesus thru Joseph. It is not to be thought that the evangelists invented these lists of names. They show a separate tradition, which was anxious to prove the Davidic descent of Jesus. which was done thru his father, in entire innocence or total disregard of the contradictory story of his miraculous birth. Jesus, by the way, disputed the theory that the Messiah must be the Son of David.

In the gospel of John the supernatural parentage of Christ is definitely discarded. Jesus is called the son of Joseph, without the slightest indication by the evangelist that this phrase misstates the fact. Reproach is offered to the Master because he was the son of Joseph the carpenter, and a Galilean, born in Nazareth, and the reproach is met, but not—as it certainly would have been had the evangelists believed the story—by recital of the miraculous conception and the birth in Bethlehem, but by maintenance that Christ's doctrine was from heaven.

Paul also may be summoned as a witness against the supernatural origin of Jesus, for he speaks of him as "born of a woman, born under the law," and the phrase "born of a woman" is common idiom for every man, and has no reference, as is sometimes ignorantly supposed, to parthenogenetic conception.

Thus by careful, fair interpretation of the Bible itself, I decide that Jesus was the son of Joseph and Mary, born doubtless in ordinary wedlock, in Galilee, very likely in Nazareth. I know no reason why the world's Saviour should not have been so born. He has become to me, not less but more, now that he is not a demigod, but a man, a real brother of the poor, in whom the spirit of the Holiest dwelt. I doubt not he could heal the sick, and I am prepared to believe that the very thought of him could restore to health, even at a distance. I accept the word

that he cast out demons, tho I do not believe in devils, big or little, many or one. I can not credit the resurrection of Lazarus, and it is noteworthy that the story of the raising of the widow's son at Nain rests on the authority of a single evangelist. I find great difficulties in the accounts of Jesus's resurrection. The earliest and the only personal testimony is that of Paul, and he describes merely a vision of a being in heaven. Paul relates the other appearances of the risen Christ as tho they had been precisely the same as the vision granted to him, but the synoptic gospels, which are later than Paul's letters, make the matter more concrete, while in the fourth gospel we find a doubting apostle convinced by physical examination of the body. The gospels themselves are sufficient evidence that the resurrection was seriously questioned in the days when it was first maintained.

It is evident from the foregoing that the Bible is no longer for me an infallible book, even for substance of doctrine. I have discarded definitely all doctrines of inspiration, and I believe that the whole notion of an authoritative written rule of faith has been a fearful drag-weight upon the Christian Church. It has been the mother of persecutions and contentions without number, and of sects and divisions, vagaries and insanities, beyond power of calculation. The Bible needs no theory to support it, no defense to protect it. It can stand of itself, the noblest product of the human spirit in the form of writing, the most magnificent testimony to the power of faith and the worth of true religion.

Unquestionably the inspiration of the Bible, the miraculous birth and resurrection of Jesus, and his power to work miracles, would be rated by the vast majority of Christians among the essentials of Christianity. I have no doubt but that the overwhelming sentiment of the members of my own religious communion, both clerical and lay, would condemn the views of which I have made confession. My position is not altogether a pleasant one, and is not made more agreeable by the condemnations frequently spoken against those who stay in a religious body with whose opinions they find themselves in disagreement.

Yet with absolutely no hope of ever beating my way back to my childhood faith, with firm belief that my convictions as to the manhood of Christ, the legendary character of much of the Bible, will deepen rather than disappear, I am resolved to stick firmly where I am, a minister of the Christian religion, a clergyman of an orthodox Church. Nor do I propose to indulge in a campaign to stir up any chance heresy-hunters who may happen to live in my neighborhood. If they find me out, I trust I shall stand to my opinions like a man, but until I am forced to declare my views, I shall endeavor, not to publish all I know, but never to speak what I do not believe, and in speaking my belief to give utterance to that which will lead forward, establish vital, spiritual faith, and prepare those whom I may influence for the inevitable day when the legendary character of the framework of the gospel will be generally known.

Some will say I ought to leave the ministry. It is clear as day to me that I belong in the Church, and right where I am. The children run to me when I walk the streets. The poor and humble swing their doors open wide when I knock, unbosom their sorrows and their secret joys, and grant me their benediction. Boys come to me to counsel them what business or profession they shall adopt, and men talk with me freely of the deepest things of life. I enjoy preaching, and Sunday after Sunday I feel myself a very priest of God, ministering holy faith to needy souls and sending men to their tasks with new strength from the touch of the infinite spirit. This was the work to which I gave my life; why should I leave it? I did not consecrate myself to the chattering of a creed or confession; had I done so, with my change of view I could only withdraw. I gave myself to helping men in the spirit of Jesus Christ, and that I can do and will do until my superiors shall say me nay.

I have hopes that before many years the heresies, as undoubtedly they are, of the miraculous origin and resurrection of Jesus will become at least tolerated opinions. With patience, tact and perseverance I hope some day to bring out

this deliverance of my soul, as I have already waited in patience for a time to declare my opinions of the atonement. To expose it now would endamage my real work, which is not to teach history, not even true history concerning Jesus and his Apostles and his Church, but to enlarge lives with real religious faith, and induce sound morals and gentle virtues thru devotion to duty as God gives me to see it. One shrinks from being called a hypocrite, but it is encouraging to remember that in Jesus's time they were not branded as hypocrites who counted themselves still Jews and went to the feasts, while in utter contradiction with the doctors of the law and the prevailing opinion, but they were styled hypocrites whose prayer was not prayer, whose charity was not charity, who were not real in their religious life. Let a man love God with all his heart, live deeply in the spirit of the Prophet of Nazareth, dare to cherish as his creed whatever God teaches him is true, and be wise enough to speak to his fellowmen, not in order to relieve his mind, but to do them good.

Theodore Roosevelt: Recipient of the Peace Prize

BY HAYNE DAVIS

THE award of the Peace Prize for 1905 to President Roosevelt is remarkable for several reasons, as well as gratifying to Americans. Thirty Nobel prizes have been awarded, but this is the first one that has been received by the head of any state. It is the first one awarded to an American. And it is the first Peace Prize awarded to one whose notable services in the cause of peace were rendered during the period for which the prize was awarded. This last fact is all the more remarkable, because one clause of Mr. Nobel's will provides that the Peace Prize is to be awarded each year to the person who has rendered the most effective service for peace *during the previous twelve months.*

When this will became operative (1900) the members of the committee were confronted by this clause and by the fact that those who had done the most notable deeds in the cause of peace had rendered these services during several decades, and not during the previous twelve months.

So they decided to clear the slate by awarding the prizes to the veterans in the war on war before adhering to the strict letter of the will. Had they done otherwise, they would have defeated Mr. Nobel's will by strict adherence to its letter. They awarded this prize to Frederick Passy and William Randal Cremer, the creators of the Interparliamentary Union; to Dr. Albert Gobat, its general secretary, and to M. Eli Ducummon, president of the Permanent Peace Bureau at Berne; to Baroness Bertha von Suttner, who suggested this way of promoting peace to Mr. Nobel, who organized an Interparliamentary group in the Austrian Parliament, and a peace society at Vienna, of which she has been president, during a decade or more.

The logic of events has now compelled them to leave the past and come to the present. Like all the rest of the world, the members of this committee felt a thrill of hope when the Interparliamentary Conference declared at St. Louis for a second general assembly of the nations to consider ideas whose adoption would make permanent peace a possibility. This gleam of hope began to burn strong and bright when President Roosevelt announced, on the 24th of September, 1904, that he would invite the nations to such a conference at an early date.

Count Albert Apponyi declared at the time that the President had rendered a service of supreme importance to the

whole world by this progressive act, done so decisively and in words of almost biblical simplicity.

In my opinion, all the other things that the President has done to promote peace thru arbitration are not equal in value to what he has done and will yet do, in causing this second conference of nations to convene and to declare for the things that pertain to the peace of the world.

Within thirty days after the President promised to call such a conference, the State Department was awaiting replies from all the nations represented at the Hague Conference of 1898 to a communication, ordered to be sent by the President, embodying the resolution upon which the President had acted, and a request that these nations consent to participate in such a conference. Before 1905 was well at sea, so many favorable responses were received that the assembling of such a conference became an assured fact. But as war was still raging in the East, it seemed best to have the conference convene after the re-establishment of peace. Mr. Roosevelt was unaffected by this delay. He kept his eyes on the course of events and grasped the first opportune moment to bring the war to an end.

In proposing a conference to negotiate terms of peace, it is remarkable that he promised to provide a place *where the envoys would not be interfered with by any other powers.* Europe was thunderstruck by this proposition. After China and Japan had concluded terms of peace in 1890, and were pen in hand to subscribe the treaty, its execution was forbidden by Russia, Germany and other European powers. When Roosevelt made this move European statesmen were pondering over terms of peace to which they would give their assent. It is easy to imagine their amazement at Mr. Roosevelt's proposition. When the peace envoys arrived in America they found that the President had prepared a place for them to negotiate at Portsmouth, N. H., where no European diplomat is ever seen. On their way to this quiet place the envoys conferred with Mr. Roosevelt at Oyster Bay, and felt for the first time the force which is embodied in this man. Later they and the Emperors of Japan and Russia were to feel this force again, for after much negotiation and much cabling to Tokio and St. Petersburg, it seemed as if terms of peace could not possibly be agreed upon. Mr. Roosevelt felt that peace could and should be concluded, and he made both the Emperors feel this, and as a result of his action, at the crisis of the negotiations, peace was re-established.

This was an even greater service to the world than appears on the surface. For by ending this war in this way, *Mr. Roosevelt moved the world's political capital from Europe to America.* That was a greater service than ending one war, for it ended the predominance of European and monarchical governments in international councils, and gave that predominance to America. It placed the heaviest pressure on international politics at the proper point—the point where principle rather than policy or will is the rule of action. This will continue after Roosevelt ceases to act as President, and it will promote progress, and peace founded on justice. Eminent Europeans have confessed this and time will prove that it is true.

The termination of this war opened the way for the assembling of the conference called by the President, and he began at once to press for this. The resolution on which he had acted in calling for this conference did not mention South America, but it was drawn intentionally so as to include those States. In sending out his preliminary invitations Mr. Roosevelt addressed only those States that were represented at the Hague in 1898, and as no South American State was invited to that conference, no South American State was included in his first invitation. But, after securing the consent of the States represented at the first conference, to participate in a second, steps were taken to bring South and Central America into this conference, and in consequence *every real* State in the world will be represented at the coming conference.

We owe this to Mr. Roosevelt, not to him alone, but to him and others, whose work would have been in vain, for the present, if he had not acted as he did: for instance, Mr. Bartholdt, who drafted the resolution on which Mr. Roosevelt acted, Count Apponyi, Lord Weardale, Baron d'Estournelles, Senator La Fon-

taine, Marquis Pandolfi and others, members of the Interparliamentary Union. I confess that I find difficulty in estimating the relative value of the services rendered by these and other gentlemen, who had to do what they did before Mr. Roosevelt could succeed in doing what he has done.

Fortunately the Nobel Committee is prepared to award this prize once a year, and so it can honor all who have rendered very conspicuous services in the order of their apparent importance, without causing serious injustice even if they err in estimating the service of these g and peace workers.

Mr. Roosevelt's services have certainly been both conspicuous and effective. Almost too numerous in fact to mention.

Besides the services already mentioned he has the honor of sending to The Hague the first case ever tried by that august tribunal, from which the reactionary Powers of Europe were endeavoring to withhold all power of action.

When Roosevelt became President he found a long standing controversy with Mexico still unsettled. It involved the right to a million dollars that the Mexican Government had taken possession of; also the right to receive $50,000 annually as interest on a large sum.

Roosevelt sent this contention to the Hague Court, and as a result of this first decision ever rendered by a duly constituted, permanent Court of Nations, Mexico has paid us the $1,000,000 and is paying us, annually, a sum slightly in excess of $50,000.

By this act Roosevelt set the wheels of this actual but inactive court into motion. It has been supposed that he was almost entirely responsible for forcing the European Powers to resort to this court in the famous Venezuela controversy.

Baron d'Estournelles has said that this act saved the life of this court. Mr. Justice Brewer, Count Apponyi and other eminent men in Europe and America have been very high in their commendation of him for this action.

This was certainly a very valuable service to the world, for it compelled the nations that had created the Hague Court to resort to it at a time when they seemed bent on boycotting it, and in this instance they wished to avoid it by inducing Mr. Roosevelt to act as arbitrator. When this suggestion was first made, near the beginning of the negotiations, Mr. Roosevelt let them know that he regarded the Hague Court as the proper judge in this controversy; at the same time their offer to have Mr. Roosevelt act as arbitrator was made known to Venezuela, and that country advised our State Department that it would accept Mr. Roosevelt as arbitrator with pleasure.

Subsequently all questions in dispute save one were disposed of by agreements, concluded at Washington, between Mr. Herbert W. Bowen, acting for Venezuela, and the representatives of all creditor nations.

The unsettled question was whether the Powers that resorted to force for the collection of their claims against Venezuela were entitled to payment in full of the whole amount found to be due them, before the Powers that were forbearing should receive anything.

The contention over this one question jeopardized the peaceful solution of the whole matter, which seemed so near at hand. At this juncture Sir Michael Herbert proposed, not to Mr. Bowen, acting for Venezuela, but to Mr. Hay, that the President settle the remaining point as arbitrator for all the Powers.

It now seems that both Mr. Hay and the President were won over to the idea of having the President act as arbitrator. And Mr. Hay endeavored to secure Mr. Bowen's consent to this. Mr. Bowen now took the position that the Hague Court should judge between all the nations concerned on this one question of pure law.

By making a strong stand for this Mr. Bowen prevented the President from yielding to the insistence of the European Powers; and when the President gave them his declination, he told them the court they had created at The Hague for just this sort of question was the proper place to go with their controversy. And they all went there—fifteen of them—and when this case was called for trial at The Hague, the International Court made another firm and long step forward toward an established legal and effective position in world politics.

The decision rendered was a disappointment, for it gave preferential payment to those who resorted to force. This is not strange, however, for the only way nations now have of collecting just debts from each other is by resort to force.

The court merely stated the law as it stands, and it was well for this law to be declared by this court rather than by the President of the United States. Our relations with South America would not have been improved by our Chief Executive declaring as law a doctrine that sets a premium on quick action in collecting claims by warships.

As it is, this case has improved our relations with all nations, and the whole world is under a debt of gratitude to all the diplomats who took part in this historic event, but especially to Venezuela and to Mr. Bowen, who represented that country, and to President Roosevelt and Secretary Hay, who acted for the United States.

The President and Mr. Bowen are under mutual obligation in this matter. Mr. Bowen seems to have saved the President from rendering a decision which placed a premium on resorting to force in collecting claims against South American States, and Mr. Bowen is under obligation to the President for enabling him to cause this case to go to The Hague.

Some of the advocates of peace are loth to acknowledge the place of Theodore Roosevelt in the peace movement, because they are so strongly opposed to his army and navy program.

These good people who, it must be said, are tireless workers in the cause of arbitration and peace, seem not to have an adequate sense of the responsibility which rests upon the chief executive of a great nation. Their very desire for what is much to be desired seems to blind them to duty of handling the actual facts as they are today.

The President must be ready to face conditions as they are, however much he may labor at the same time to alter them for the better.

Furthermore, preaching peace for a century is no greater service of the cause, than working your way to a position where you can speak the word that is to effectuate this aspiration.

All the years of Mr. Roosevelt's busy life, all the bold stands that he has made for right, have been preparing him to take these successful stands in the cause of peace and justice, so that he could end the war in Asia, start the wheels of the Hague Court to moving, convene a world's conference at The Hague.

He has always been a force too strong for mere politicians, and has now become a power too strong for powerful party leaders.

He has already influenced directly the action of every nation of the world, and if he takes a stand for the progressive plan, that has now been approved by the Interparliamentary Union, he will be able to determine the action of the conference he has called, and of the nations that are represented there. And in that case he will be instrumental in establishing the Hague Conference as a permanent part of the world's legal machinery, and in enabling the wheels of the Hague Court to turn automatically whenever international wrongs need to be righted.

He has already availed himself of more opportunities to promote peace thru arbitration and mediation than any other living man, and he still has more opportunities of this kind than have fallen to the lot of any of his contemporaries.

He can be relied on to grasp every opportunity to promote this great cause unless it be in the case of Panama where he himself is a party. And why should we not believe him capable of rising to that hight? It is none too high for the man who sits in the seat once occupied by George Washington, and none too high for the man who should exert the predominant influence in the international politics of our day. Such an act is particularly needed, as an example to Europe, for the executives of Europe are hereditary. Unless our Presidents rise to the hight of allowing their acts to be past upon by the Hague Court, can we expect hereditary sovereigns to do this? And if they must pass away before their acts can be reviewed by International Courts the cause of arbitration has a long hill to climb.

Now that the Nobel Committee has cast its eyes across the Atlantic in its search for great lights in the peace sky it is to be hoped they will see and value properly the works of several Americans

who seem worthy of receiving this prize. There is Hon. Richard Bartholdt, whose action gave President Roosevelt the opportunity to influence to action of every nation along the lines that make for permanent peace, and who has himself influenced directly the action of the Interparliamentary Union in several important particulars. There is Andrew Carnegie, who has taken a place in the very front rank of the doers of deeds that promote peace. There is Mr. Albert K. Smiley, the founder and inspirer as well as the supporter of the Mohawk Conferences on International Arbitration. And there are others whose work is well known, others whose services are rendered in that invisible realm where thought determines action without being proclaimed from the housetops.

It is said the Nobel Committee fears that worthy recipients of the Peace Prize may not be found after a little while. America alone can keep them supplied for a long time, and if individuals seem to fall short of the requirements during any twelve months, where is the Interparliamentary Union? Is that powerful body going to die or cease to act before permanent peace is established?

New York City.

Paid Motherhood

BY CHARLOTTE PERKINS GILMAN

Author of "The Home," "Woman and Economics," Etc.

WAS it coincidence, blind and fortunate, or hidden editorial skill, that put the exquisite poetry and truth of the mother-song, "Ted," in the same issue of The Independent with Mr. Wells's stirring article on "Socialism and the Family"?

Whether intended or not they are good neighbors; and the wise student of social laws should read both; the undeniable facts in Mr. Wells's arraignment of the "proprietary family," and the as undeniable facts of maternal love. The mother, even of "an insufficient child or so," is a factor in the case far older and more important than the family in any form.

Let it be understood to begin with that I am not contradicting Mr. Wells, or seeking in anyway to oppose the service he is rendering society. No one man today is doing more to move the thought of the world than this great English author, with his scientific imagination, his passion for beauty, his thrilling foresight of what life may be when we choose; and these particular articles on socialism I consider more timely, wise and true.

But it is not given to any of us to have the complete vision, and in this splendid work of Mr. Wells it seems to me that he misapprehends the nature of humanity when he advances as one element of social solution, a paid motherhood. The idea is well supported, it is true, even by some women, but surely it is only thru a partial and disproportionate view of the facts in the case.

In that chaotic bunch of animal instincts, race habits, religious beliefs, civil laws, social traditions, real and artificial emotions called "the family," we have not yet learned to distinguish between its legitimate bases and its wholly illegitimate and unnecessary additions.

We have accepted it as we found it, good and bad together; and when anyone criticizes an abuse therein, others fly to its defense as if any change would mean destruction. A glimpse at the history of this social group should be reassuring to the alarmed defender, and equally so to the conscientious critic.

Life on earth is continuous; yet the vehicles of life, so far, have proved sadly temporary. As soon as we get a view sufficiently distant; or run the facts along with sufficient speed, we see the continuity of each species, one eternal line of living creatures, in which the birth and death of individuals is but a flickering kinetescope effect. The maintenance of

the race life is the main purpose; the methods vary widely, and matter little so that they serve.

When ages of development brought us the mammalian mother, with an increasing period of infancy, love grew with babyhood; and when the father began to do mother-work, in furnishing economic support to the child, then father-love grew also.

So long as mother and father were the only support and defense of the child, this parental love was all he needed, but that time is long past. We have reached the period when the social parentage is more important to the child than the personal; when the public safety, the public prosperity, the public wisdom and virtue, have more effect on the lives of our children than our private effort and influence.

Education has become more and more a recognized social function, and is extending its service to the child by the will of the majority, irrespective of the parent's ability or preference. The parent has no longer power of life and death over the child as was once the case; nor freedom to neglect and injure; the State is reaching out to protect and benefit its young citizens as well as its older ones; and to deny personal property in human beings, even when babies. It is this relation between child and State which Mr. Wells sees; this duty of social parentage; and he urges as concrete expression, that motherhood be recognized as a social service and rewarded as such—that the mother be paid for her motherhood.

To quote directly, not from his article in THE INDEPENDENT but from one published in the *New York Herald* on November 4th:

"Socialism says boldly the State is the over-parent, the outer-parent. People rear children for the State and the future; if they do that well they do the whole world a service, and deserve payment just as much as if they built a bridge or raised a crop of wheat." And again: "The State will pay for children born legitimately in the marriage it will sanction. A woman with healthy and successful offspring will draw a wage for each one of them from the State so long as they go on well. It will be her wage. Under the State she will control her child's upbringing."

He further indicates a "joint control" by the father; then speaks of "the monstrous injustice of the present time, which makes a mother dependent on the economic accidents of her man," and then goes on to say:

"So, too, the still more monstrous absurdity of women discharging their supreme social function, bearing and rearing children in their spare time, as it were, while they 'earn their living' by contributing some half mechanical element to some trivial industrial product, will disappear."

It is here that I take issue with Mr. Wells, holding that he confuses two quite distinct things—*motherhood,* which is a personal function, with *education*—which is a social function. He refers to "learning" and "rearing" children as if these processes were identical, or at least inseparable; while they are quite dissimilar and detachable.

Further, in this perfectly distinct proposition to give the woman wages for her children, it is admitted that they are hers to begin with; that they must be paid for like any other commodity—as the bridge or crop of wheat; and, logically, that being paid for, they become the property of the purchaser. This is a kind of property right in children which is precisely what we have outgrown. If money is to be earned by producing children, there are fortunes for the fertile African or Italian, and scant support for that unfortunate possessor of the "insufficient child or two." If the reward is in proportion to the value of the children—which is never determinable until late in life—we simply open a field of unlimited struggle and confusion. If the mothers and fathers had any voice in the decision the prizes would be widespread; if they had not, who is "The State" which overrules them?

The Socialist state is the community, men and women together; and they are not likely to come to an agreement as to the relative market value of their babies.

Even health, vigor and beauty at birth; even early intelligence and amiability do not always distinguish the best social servant. There is no scale by which human beings can be standardized and paid for at birth or in childhood. Moreover, if there were, unless we propose to promptly destroy the unfit, the inferior child needs more money than the superior one, more care, more

intelligent training, in order that he may perform his lesser service well.

But, aside from these objections, look at the effect of marketable motherhood on the mother. Mothers are human. Being human, they are open to the same weaknesses as other people. This money, this wage, is to be paid to them as the producers of the children. If it works well it would tend to improve the quality of the children by an appeal to the cupidity of the parent. See the far-sighted young girl improving her health and studying child culture that she may thereby draw larger wages in this, her one profession; for there does not seem to be much prospect of wealth in contributing that "half-mechanical element to some trivial industrial product," and thus, if she influences the offspring at all, handing down a keen eye for the main chance, as well as her health and vigor. But if it works ill, if its direct appeal to the business sense should have the same result in the child market that it does in the cattle market, what a scene of tricking and bargaining in young humanity! No; the element of payment is totally out of place in this relation.

Motherhood is not to be bought or hired without most grievous injury. It is not a process to be undertaken for pay; not a trade to make a living by neither; and here I make my apologies to Mr. Wells for the sharpness of the denial; neither is it necessary for the full extension of that social parentage we both so deeply believe in. There is a broad and vital distinction between maintaining the child and paying the mother. See, for instance, our public-school system. Here social parentage is well represented. The State furnishes education to the children free, paid for by taxes which bear no relation to parentage. That is a totally different thing from paying each mother a fixed sum to devote to the education of her children. It gives no premium to numbers, no appeal to self-interest, no "reward" for motherhood, but quietly performs the social duty of educating the child. Its methods may be greatly improved upon; will be as fast as our people have the intelligence to demand it; but its system is a wise one and works well.

This legitimate system of public education may be extended indefinitely. It has already reached out to the State universities, giving the higher courses of study to older students; it has also crept down to the little ones, in some more advanced communities, and gives the free kindergarten as well as the free college.

There is no logical objection to its continued development along normal lines, until every child of a civilized country will be guaranteed necessary food, clothing and shelter, and all education possible to him, as the parental obligation of the State.

This large and ample provision for the child is not in the least identical with payment to the mother. It does not confuse mere childbearing with the unlimited processes of child-rearing, nor imagine that facility in the first implies the least degree of excellence in the second. Such a form of social parentage as seems to one the normal socialistic development will recognize education as the "supreme social function" perhaps, but will not attribute this tremendous power to every normal female who shares the ability of all viviparous creatures to produce young.

It will call for honor, and nobly reward those specialists in child-care who may most rapidly advance the species, most perfectly develop the child.

Such mothers as are best fitted for this great work will be perfectly free to practice it their lives long, giving the advantage of their special love and skill to many children, including their own, and such mothers as are not best fitted for it will be free to follow other professions.

Every normal woman should know the joy and pride of motherhood, but she is not, therefore, a suitable person to educate young humanity. Every child should have the sweet and tender warmth of mother love; but he should not, therefore, be denied the advantage of a real education.

The mother, in a highly socialized state, will be, herself, a specialized worker, a broad-minded, able, conscientious citizen. She will do her part as a member of society, with valuable special service and as valuable special development.

Here is where Mr. Wells, in his con-

temptuous allusion to woman's work, errs so widely. It is not true that the only thing they can do is to contribute "some half mechanical element to some trivial industry."

Women have human faculties as men have; need to use them, as men do; to serve society by them, as men serve. Human service is not a masculine prerogative, nor a feminine; it belongs to both sexes, for both are human.

Now maternity is not a distinctively human function, and does not satisfy the human soul. Education is a human function, and is satisfying to the men and women adapted to it; but most men and most women are adapted to other things.

Always bearing in mind that those mothers who desire to care for little children, who can prove their fitness, who are willing to study and practice long and hard to qualify for their great profession, may give their whole lives to this service; we may cheerfully look forward to a time when mothers, not so specialized, may proudly and gladly bear children, love them all they are able, and by their organized activities provide for their children better care than they could give personally.

It is quite a mistake to suppose that all women wish to take care of their little ones.

The first servant that a woman hires is a nurse. The nurse is one of the oldest figures in history. Esop's Fables allude to her; Egyptian hieroglyphics recognize her. Mutual assistance in child care is not new. But the women of the past entrusted this great work to slaves or dependents; the women of the present do so still; it remains for the women of the future to give to their little ones a care above the average—instead of below it. Such a line of development as this in no way interferes with the sweet privacy of mother-love and father-love any more than the public school does now. It means much change in our methods of building houses, in our scale of payment for teachers, in our education of those who aspire to take charge of human youth during its most impressionable years. But it means no change at all in the mother's individual love and pride and happiness, and does not intrude upon it with this well-meant but revolting suggesting of paying wages for motherhood.

Skilled Artisans

BY BOLTON HALL

AUTHOR OF "THINGS AS THEY ARE," ETC.

"I WANT my coat shaped so," said I to the tailor. "It is not according to my pattern; it will not make a good job," said the tailor.

"But I want it so."

"Then, my dear sir," said he, "you must cut it yourself or find another tailor."

So I tried to cut it myself.

"I want my life shaped so," said I to God.

"It will not be well for you," said God. "It is not according to my law."

"But I want it so," said I.

"Then, my dear son," said God, "you must shape it yourself or find another God."

So I tried to shape it myself.

NEW YORK CITY.

Advice to Literary Aspirants

BY MRS. L. H. HARRIS

THE writer of this article is of no particular importance in the literary world, but is sufficiently well known in connection with it to receive many letters from young people who contemplate the literary career. And the following reflections are offered in the hope that they may in some degree clarify their minds concerning the requirements necessary to realize such an ambition. For it is plain to infer from their letters that with most of them the idea of a "literary career" is befogged with many vain imaginings. Thus, they nearly all say that they prefer to write fiction. They think that their gift lies in this direction. And doubtless it does; the young have naturally fabulous minds. But if they only knew it, this is their chief difficulty. They do not know enough, which is the truth about the diphthong of good and evil in human nature. They think that fiction is literary copy, easily made out of the virgin imagination—an error, by the way, which they share in common with some popular novelists—but really fiction is, or should be, the scriptures of life put in parables. And more genius, wisdom and inspiration are required to produce it than any other kind of literature, except perhaps great poetry.

Here, for example, is the case of a Western youth who writes that he has withdrawn from college at the end of his freshman year, and will give the whole of his time to the business of becoming a "literary king." I did not advise him to return to college. It would have been useless; besides, there is no better way to break a young man from butting than to encourage him with a stone wall. But for the sake of others who contemplate the crown of a "literary king," it is well to call attention to this fact: The Western youth will never realize his ambition, not because he left school during the shell-pipping stage of his intellectual development—(one of the most popular novels ever published in New York was written by a very young lady who had not and probably never will pip her shell intellectually; the average reader does not know the difference)—but because he has no sense of the value of words. Used as he means them, the noun and adjective in that phrase are separated by the whole history of literature. You may as well speak of a buck-saint as of a "literary king." The terms do not stand for a clarified idea. Here is the point—to write literature, one must understand the finance of language. The greatest evidence of genius is not what a man can think, but it is the way he can say the great things he thinks. If he can set his word like a plow in the sea, if he can measure the heavens and the earth with an immortal verse, if he can tell what love is, if he can give fair visions to small minds, these are signs that he understands the value and the exchange business in words, the finance of language.

This does not imply that the literary career is closed to all who have no particular gift of expression, but only to those who, like the would-be "literary king," have no sense at all of expression. Recently a young man sent me a "piece" which he had written, and which had been published in the county paper. He wanted to know if it "showed any talent for writing." It did not. The patent medicine advertisements on the same page showed more. But this is no reason for him to despair. By examining the

leading magazines, those which are supposed to "mold public opinion," we shall find that the longest, most influential articles are from men and women who have no talent for literary expression. The best essay about Thackeray by an American author is written in a style so rude and obstructed that to read it aloud is like walking over newly plowed ground. Writers of this class cart their thoughts about over the page in heavy, rumbling sentences. They log-roll their ideas with words that merely strain at them. But they have ideas, often so huge that they turn the tides of civilization and lift a whole nation in the scale of things. That is to say, get an idea big enough, sufficiently pertinent, and the world will accept it; the literary critics will bow down to you, credit you with a literary style of almost impenetrable dignity, even if you offer the thing in its stocking feet and with not more than the rude scratching of your pen to outline it.

I have chosen the letter of a young college woman to illustrate another vagary concerning the literary career. She incloses an essay of thirty-two pages on a very grave subject; and it is an astonishingly mature production. Each sentence is securely hemstitched to the next with due regard for logic and for the rules of syntax. But the thing reminds me of Mrs. Humphry Ward's new novel in one particular—every thought in it has been taken from one or the other of the half dozen books which she read preparatory to writing it, just as Mrs. Ward puts the hero of her story together from the lives of other men. And the only original thing about it is the only original thing about the novel—that is the art and deftness with which it is put together. The author tells me that it "won the prize," and she asks if I think she could ever learn to write. I do not know. When we look at a new-born babe, we may be looking at a great literary genius, but we do not know it. Just so this young woman may be capable of producing literature, but the composition she sends is about as much indication of the fact as if she had sent a neatly pieced-together bed quilt.

Now who is to blame, or, indeed, is any one to blame? Young people have very few ideas of their own, and these are in a state of confusion or gestation. And it is clear that they must learn what is in books, if for no other reason than that a diver must have a springboard from which to pitch his own performance. But here is the rub: mere learning, as most of us get it, tends to subjugate the mind, to "train" it, if you like the phrase better, to increase the critical faculty, and to destroy intellectual individuality, that mental presumption upon which original thinking depends. On the other hand, if you encourage the creative faculty, that separate personal audacity of the mind, you get something obstreperous, unruly on your hands, particularly if you are dealing with the young, which is far more difficult to develop than it is to teach grammar, rhetoric and the history of the literary masters. But, however inconvenient, and doubtful of the issue, this latter seems to me the most desirable reason for educating the young. And at the risk of rushing in where angels fear to tread, I venture some advice to the young college men and women who contemplate writing "prize essays" next spring. Do not write them—that is, not this kind. The man whose essay comes nearest containing the gist of everybody else's ideas on that subject may be the best student, but if that is all, it is not enough. He may have the piggin mind, a mere intellectual teakettle for the boiling of other men's thoughts. Do not be a literary teakettle. In the first place, find out if you really have a mind of your own. Most people have, but very few of them ever discover it. Then do not join the ranks of those intellectual boobies who think that the free mind consists in showing the donkey heels of their wits as often and as antagonistically as possible. On the other hand one should not be lacking in courage. It is the greatest capacity with which we are endowed. Cultivate the superb madness of making seventy times seven dashes at the thing you want, only do not want "prizes." Prizes of one sort and another have damned more people than anything else. If you hanker after medals and "making a name" for yourself, and that kind of brass-button foolishness, it is a sign that you have not the right kind of sense, nor the right kind of courage.

Here is a letter of another young lady who "hopes to write some day." She says that she belongs to a small club of authors, that all of them read their productions when they meet and receive "criticisms" from each other. This is how she came to learn that she had "temperament," but no style, and no sense of color in her use of words. And she was advised on this account to eschew all modern literature, and to read Scott, Ruskin, etc. She says that she is "wallowing in the sea of despair," and she wants to know what she ought to do. The first thing anybody ought to do who is in the sea of despair is to get out. It makes one's literary style lackadaisical. And, of course, it is well enough to belong to an authors' club. They are very interesting people as a rule, and one may learn much about the literary perversions of human nature by observing them, to say nothing of enjoying their more admirable qualities. But one author should never go to another for an opinion of his work. Authors do not make good critics any more than critics make good authors. For it is the nature and law of being an author that he should find fault with the other artist's work, if it is not wrought out as he would have wrought it. So it happens that almost any writer who accepts unreservedly the advice of another loses the hall mark of his own individuality from his work, and is apt to acquire that of his mentor.

But the all-important thing to do is to get from under the literary microscope. You cannot make yourself a genius by feeling of your own intellectual toes, or by allowing the authors' club to feel of them. Nothing so obstructs the mind as a diffident self-consciousness. And so if you do not get out of your own way, you will have only a puddle of distracted ideas where your mind ought to be. And you will never be able to organize or project it valiantly into any effort. Neither is there any reason for congratulation on the score of having "temperament." That is what we all have more or less of in common with teething babies, hysterical women and musicians. It is a regrettable nervous frenzy which does, indeed, impart an emotional quality to literature. But do not wear and tear yourself to develop one, for it is not absolutely necessary. There is a very distinguished writer in New York, whose "temperament" (if he has any) I was not able to discover during an acquaintance of several years. His face never changes expression, his eye never kindles, he has but one tone of voice, no temper, no capacity for emotion that I could ever discover. But he is a master of literary expression as few are masters of it in this country. And I never heard that he or any other important man of letters was put on a literary diet warranted to produce "style" and "color." By all means read Ruskin and the rest, but not as if you were taking a literary health food. Do not fatten even on Shakespeare!

But this reported lack of the sense of color in the use of words is what grieves our young aspirant. She says "I would rather have it than anything!" Why? It is the commonest of all gifts. It is the characteristic vulgarity of modern fiction, where all sentiment is painted red, white and blue, or in some other national colors; where love itself is a glaring poster on a billboard. We talk so much about pigment, our minds are so red with barbaric thinking, that these young people think that literature cannot be produced without a paint-pot vocabulary. Certainly it can be produced that way, or Keats had died a mere drug clerk, but it can be had without so much paint. There is no color in Ossian's poetry. Jean Paul Richter had the mastery of words that produced the impression of limitless spaces, but they were as colorless as ether. De Quincey's sentences rise and roll like the waves of a great sea, but they do not suggest color. Some have a literary style which secures the melodic effect with no hint of color. Most readers prize Stevenson on account of the pigment in his style, but I think that it is far more distinguished by the wittiness, delicacy and symmetry of his thought. And so, being encompassed about with this cloud of witnesses and by many more, too numerous to mention, look about you and reflect whether nature intended you to have a colored literary style. Be assured more particularly of this: there is virtue, chastity and modesty to be observed in the use of words. Nothing is so fine,

elevating, austerely sweet as they are when properly used to convey the simplest idea; and nothing is more disgusting or debauching to mind and spirit when they are improperly used to convey any kind of an idea.

And now I come to the last in my list of illustrations. A young lady who says that she has written a number of stories, but has never had one "accepted," sends her latest production and asks for an opinion on it. What do I think of the plot, the climax—the hero and heroine, "do they live?"

Yes, they all live too much, but not enough in the right direction. The fault is not, as she imagined, with the editors to whom she submitted it, and who, she thinks, failed to examine it because she was "young and unknown." An editor doesn't care how young and unknown you are. There is not one in this country who would not accept a story from Satan himself or from the youngest angel in heaven if the thing was good enough. Nothing pleases one so much as to discover a "young, unknown writer." He kills the fatted calf, publicly speaking, puts a literary ring on your finger, and flouts you as his trophy in the face of all the other editors. Be sure that it will not be any fault of theirs if you are not discovered; it will be your own. And that brings us back to this story. The plot is like a ringworm, waltzing 'round and 'round and 'round in a red circle of horrors; which would be the right kind in a detective story, where there was a dark house in the center, shadowed by Pinkerton men and inhabited by suspicious characters—but in a love tale!—consider the nature of love. It is a pastoral experience, the call of nature back to nature, back to the green rooftree period of domesticity. Therefore to this day lovers seek the woods and fields and primrose lanes as naturally as birds lay sticks for their nests upon flowering boughs in May. They do not sneak into dim, ugly places, nor pursue one another with frowns in a circle of disgusting and compromising adventures—that is, not if you give them half a chance to break for the open. And the "climax" is also inconsistent—inconsistent with the ringworm plot and with the nature of love. If the young author had reached that moonlit end of her own love affair, she would have known better than to have two lovers confess themselves as if the whole world was looking on. Privacy is as much a condition of such a situation as it is for prayer. And lovers do not merely shake hands nonchalantly, but they kiss, cling hand to hand, and all the energy you can think of cannot distract their joyful attention from one another. I have often noticed this disposition on the part of some female writers to avoid the first kiss. Possibly they do it in the interest of morality. There is a certain maiden novelist among us of uncertain years who never permits kissing in her books. She will tease the hero and heroine into the most tempting situations, fill their hearts with the kissing cry of love, and then disappoint them and outrage the reader by holding them maliciously apart. The effect is not so moral as she thinks it is. In all probability she has developed the kissing instinct among her adolescent readers quite as much as the "Duchess" did with her "Molly Bawn" tales. The idea is to avoid the ringworm plot and allow the right man and woman to kiss when the time comes. The commonest immorality among writers of fiction is to encourage the wrong men and women to kiss.

The young story writer should remember, first, that every human life, however commonplace, is organized about what novelists would call a thrilling "plot," else we could not bear the tedium of existence. Next, he should begin by writing mere character sketches of his characters until he becomes intimately acquainted, and can discover what the plot of their lives would have been had they really lived. Let him keep close to the discovery and he will write a story that will lift the hair upon every reader's head and sell a hundred thousand copies besides.

Among the many letters received asking advice and submitting manuscripts, I have often marveled that there has never been one from a young poet. This can hardly imply that there are no young poets; but it raises the question as to whether they seek advice and sympathy at all and from whom. From what we know of poets in general, it is certain that no other class of writers are so

sensitive to praise, so dependent upon appreciation. Therefore, the young ones probably go to the place where they are least likely to be stinted. And this is all very well in the way of courtship, but let no young bard-beau lean too confidently upon his lady love's literary judgment. She may be another Helen, but it is much more difficult to be another Homer.

Now one final sticking word of advice: No matter what line of literature the aspiring writer adopts, let him avoid the whangdoodle spirit. We all know what that is even if we do not call it by this name. It is the various ways we have, in the various walks of life, of dodging the real issue by sounding brass and tinkling cymbals. The revivalist illustrates it in the religious world when he tries to convert lost souls with a mouthful of pathetic anecdotes. The preacher is a foolish example of it when he discusses the possibility of there having been two or three Isaiahs, or raves about the seven golden candlesticks, but neglects to tell how to outgrow temptation, and how to get rid of the particular millstone of vice which usually hangs about the neck of his congregation. The political leader sounds the very keynote of it when he speaks eloquently of the "grand old party," of the glories of the republic, and of how well qualified the candidate he represents is to fit in with these "time honored" traditions, but avoids the real question which must be answered before we can go on, of why so many honest, industrious people are poor, and so many dishonest, lazy ones are rich.

The stern sentimentality and principles of the old-fashioned Northern Abolitionists have degenerated into the meanest kind of whangdoodlism. In many of their misguided descendants it is the ethical snobbery they show when they yap at the heels of Southern men about their faults, preferring the whanging moral sound of their own words to that sense of justice which would enable them to understand that Southern men have been hard pressed these forty years striving to do the square thing, against nature and tradition, and in an impossible situation for which they are not responsible. And, again, it rises to a shriek in the South whenever a blatherskite orator takes advantage of an anniversary occasion to remind us with impassioned sentences and streaming eyes of our grandfathers' swords and of a "glorious past." If those sturdy, honorable, but somewhat choleric old gentlemen from whom we inherited our swords could rise from their graves for a season, one of their first services to this section would be to kick all such puerile talkers into that state of innocuous desuetude where they belong. For, whatever their faults, our grandfathers were not doodle-minded.

It is so important to avoid whangdoodlism that I am giving as comprehensive a definition as space allows, even at the risk of boring some readers who may have contracted the habit. It is rampant in the educational world. Some of our oldest and best known institutions of learning are surviving now only upon the strength of their glorious epitaphs. And, of course, it shows up with a funny, mincing decadent primness, or with bohemian vulgarity in musical and artistic circles. If any one can bear to hear the most senile of all whangdoodlism let him listen to a catalog student talk about pictures, or to a foolish person with two or three fiddle-string nerves talk about "the dra-a-r-r-mah, you know!"

And we must admit that literary copy inspired by it has a steady market value, provided you get the popular whang. But there is always a pose, a gallery ogle in this kind of stuff which proves its inconsequence or insincerity. Eventually, people will know better than to accept it, altho they do not know so much better now. There is, for example, a magazine in this country which appears to be edited by whangdoodlers for whangdoodlers, and it is said to have a very large subscription list. The articles in this periodical are written so that they cannot possibly offend anybody or the devil, while the authors always manage to keep their hats off to heaven. The literary critic writes as if he lived on breakfast food, took his exercise in a perambulator and slept in an old maid's kitten basket. And the editorial Zaccheus, whether he writes of "Mother," or of green meadows and flowing brooks, always caters to the doodle class of intelligences. Even the people who advertise in it are not like other people. They are often whangdoodlers. One young man,

I recall, offered himself at so much per month to accompany an elderly gentleman of good moral character on his morning walks, and to furnish Christian topics of conversation! Lord have mercy upon us when an advertisement like that can appear in a widely read mazagine and not set the whole country to laughing! What priggish conceit, what lack of wit, what bankruptcy of the sense of humor it shows.

In conclusion, I have indicated only a few of the many reasons why whangdoodlism should be avoided, particularly by young literary people who care for the integrity of their minds, to say nothing of morals. I do not say that it will destroy either, but it is sure to introduce an element of spiritual anemia injurious to both.

NASHVILLE, TENN.

Young Men to the Battleships

BY PARK BENJAMIN

SOME three or four years ago attention was called in THE INDEPENDENT to the fact that we were fast nearing the perilous position of having no naval commanders capable of handling a modern war fleet in action—this because the naval officers would soon be so old on reaching flag rank that no adequate time would remain to educate them as admirals before they reached the age of sixty-two, when the retiring law ends their active career. The idea of educating an admiral as such—the notion that an officer who had risen thru all grades to the command of a great battleship might not necessarily be competent to manage a plurality of such ships in actual conflict, proved not to be easily assimilable—and hence much adverse comment followed, ranging all the way from the charge of casting needless mud at our own navy (which, it was suggested, might better be hurled at somebody else's navy) to "refutations" based chiefly on the fact that Rodney and Farragut were both over sixty-four when the one thrashed De Grasse and the other entered Mobile Bay.

Meantime conditions having continued to grow steadily worse, their own logic has prevailed, and the recent special message of the President points out substantially the same facts and repeats the same warning, while showing that today the average period of active service of our admirals has become only a year and a half and that of our captains less than five years. The President calls this "startling." To people who have just awakened to it, no doubt it is; to others who have seen it coming for the last dozen years, it is not.

The basis of the Presidential message is the report of a special board of line officers convened by Secretary Bonaparte to consider the trouble and devise a remedy—a decade or so late, as aforesaid. The gist of the proposed scheme is that, by action of law, officers are to be brought to the captain's grade at forty-eight instead of at fifty-five, and to flag rank at fifty-five instead of at sixty, thus giving them seven years to serve in each grade. To the sentimental question of what is to be done with the existing veterans whose active career would of necessity be thus abruptly terminated, the answer is the same as in 1855, when conditions of superannuation prevailed; put them on a reserve list for shore duty only.

While this plan may be the one best adapted to secure permanent relief—while, indeed, any plan looking to a removal of the existing difficulties is to be welcomed—it is one which takes time to put into execution and, by reason of its detail and of other changes in the personnel which form part of the same bill as framed, one which is sure to arouse protracted discussion in Congress. Already it is reported that the legislators are indicating a desire to "fix the matter their own way," which, tho perfectly legitimate in itself, far from suggests speedy action—already there is appearing that constant tendency to obstruct on the

part of senatorial powers that be—and, of course, there is the over-crowded calendar of the short session.

But the peril we are facing is imminent. It is a case for action now "lest the commonwealth should suffer"—as clear as ever confronted the Roman Senate. An attack tomorrow by a foreign enemy—and how sudden such an onslaught might be, the tiger-spring of the Japanese upon the Russians plainly shows—would find us unprepared with naval leaders equal in skill to those who may confront us.

It is not a matter of the patriotism nor of the self devotion of the present veterans. It is a matter purely of professional ability to be acquired not from books or war games at the naval college, but only from actual experience in handling battleship fleets at sea in battle tactics—in reproducing as nearly as practicable the conditions of real fighting—in pitting squadron against squadron. None of them have done this. The navies of other nations are doing it—none more sedulously than those of England and Japan. They are educating their admirals—even their youngest captains—at admiral's work, and they are picking out for the most responsible places the men who excel at it. They are taking these men young enough to get not only the experience but the matured judgment which comes by experience sufficiently long continued. We, on the other hand, are making men admirals solely because they have lived three score years and not been court-martialed. The root of the trouble is simply that the public has not understood it.

And yet nothing has been more persistently dinned of late years into the general ear than the need of naval preparedness—as the cheapest possible insurance against war. The country has responded by naval appropriations of a hundred million per year, by not only authorizing, but demanding, the best types of ships, and has applauded to the echo the reports which come from the fleet of marksmanship rapidly nearing perfection. What, then, are the conditions which have brought us to the present situation?

1. Primarily an implicit confidence, splendidly justified by past history, that our naval officers are equal to any emergency. "Look what Dewey—unknown to fame, not even selected for the task—did at Manila; look what Farragut—eleventh-hour choice, practically already on the shelf—did at New Orleans," etc., etc. But battleship fleet actions, which all agree are most likely to be decisive of future wars on the ocean, were not fought at either place; and, besides, since Admiral Dewey is the oft-chosen example, he can best speak for himself. Hear him:

> "In a fleet action between battleships a *skilled* admiral with experienced captains under him will soon obtain the advantage of position and will win the fight by *superior tactical experience and skill.* Admirals and captains are not born any more than skilled chess players are born. A fight between two modern fleets with high speed battleships for chess men and the ocean for a board, is a most dramatic and intensely interesting game, upon which the fate of two nations may depend. *There is no time for study, each player must be thoroly prepared and experienced, each move must be made instantly without hesitation, and a single mistake will lose the game.* . . . Let us look facts squarely in the face and not follow the example of the ostrich and bury our heads in the sand."

That is the testimony of the naval commander who rose to our last great naval emergency, given in direct reference to the existing crisis.

II. Prior to the Spanish War, and in fact up to the present massing of the battleships on the Atlantic Coast—begun some three years ago—we had no fleets or even squadrons of sufficiently like units to permit of their being handled in what is really "team play." We sent aggregations of ships to this station or that, and called them the "Atlantic Squadron" or the "Asiatic Squadron," but we mixed vessels of the latest types with relics of the Civil War. It was like hitching together race horses and oxen. We never even proposed drilling them in battle tactics; at least until Admiral Sampson went to Porto Rico. Then that much-vexed officer while on the way thither, not knowing when Cervera might appear on the horizon, did—perforce of the emergency—lay out a battle plan which somehow provided for the swift cruisers and slow gunboats and five-knot monitors—the whole museum of marine freaks inflicted on him. But usually in the ante-bellum days the flag-

ship steamed lazily from port to port, with whatever small fry there were on hand trailing along behind her at various distances—and that was sailing in squadron. And occasionally we did have an Admiral—like that brilliant officer, the late Richard W. Meade—who, finding himself with a few vessels which could (with some difficulty) be made to keep within sight of one another, wrote burning letters to the Navy Department about undertaking battle tactics practice during the summer months. What he got in return was the stolid and persistent detachment of one ship after another, despite his protests, to go to flower shows and local picnics at coast towns. The last vessel was taken when the writer happened to be in his cabin. His shout of "Do they expect me to drill fleet tactics with one ship?" is unforgettable.

And since the Spanish War? Last summer the General Board of the Navy did formulate a plan of battle tactics, and it is reported that it was sent to the Atlantic Fleet to be put into execution. The exact reason why it was not carried into effect will doubtless appear later. It could not have been for lack of opportunity, judging from the attendance of the ships at Newport and Bar Harbor when social functions prevailed. A fleet which, in utter indifference to the rules of the road, can drive into Newport harbor thru a dense fog at twelve knots per hour, with ships 400 yards apart, and incidentally have a collision which, among other things, reveals a captain below, with a midshipman in charge of the deck of his battleship, is certainly not one to shrink from any risk due to the close quarters and swift changes of battle movements; nor is it possible to imagine any danger of inaccurate ship-handling by individual commanders, who are not unaccustomed, on suddenly emerging from thick fog, to such a signal from the flagship as "You are twenty yards out of position!" But the public should understand that the fact remains, whatever the reason may be, that the fleets of the United States of America have not yet been drilled at battle tactics.

III. It may be questioned whether the general satisfaction with the marksmanship of the navy has not caused us in a measure to lose sight of the equal importance of admiralship. The President, for example, referring to the augmented skill of our gun-pointers, says that our efficiency is twice what it was five years ago. This, of course, is not quite so inspiring when it is remembered that we have been by no means alone in such progress; and that whatever our advance may be it is debatable whether that of Great Britain has not been equally as great. The "Drake," our visitor of last year in Admiral Battenberg's squadron, has lately made 106 hits out of a possible 133, on a target *four miles distant,* with 9.2 and 6 inch guns. It was just about five years ago that the London papers were excoriating one of the principal British squadrons for a target record of barely 32 per cent. hits.

But granting we can achieve even 100 per cent. hits, the need for admiralship remains just as urgent. Marksmanship means hitting the target after you have been put into a position where you can do so. Admiralship puts you in that position. For the winning of battles between fleets, one is the necessary complement of the other. Marksmanship in peace times is achieved by much practice firing at targets of known dimensions from positions taken at will. But under fighting conditions there is always to be assumed a vigorous enemy consumed with ambition not merely to prevent you getting into such positions, but to put himself in places whence he can hit you and you can't hit him. He will get his battle column, for example, across yours and in front of it—"T" you, as it is called—and converge his whole broadside fire on your leading ships and tear them to pieces *seriatim,* while you can only bring your forward guns to bear on him, and do other unpleasant things to you, if you have not the skill and nerve to do them to him first. That is the marine chess game which Admiral Dewey speaks of, and which Admiral Togo played with such consummate ability and marked success in the Sea of Japan.

IV. Not only has the stress on marksmanship somewhat obscured the importance of admiralship, but so also to some

degree has the great public interest in the building of war vessels. Because England built the "Dreadnaught"—and because Japan is building the "Satsuma"—we are going to build a leviathan of 20,000 tons and ten million dollars cost. England has not yet any fleet or squadron of "Dreadnaught's," nor Japan of "Satsuma's," nor do we exactly contemplate a fleet of, as yet unnamed, Colossi. Of just what use in the present order of things, when strength is dependent on team play—and team play means homogenous units—a single monster is to be whose draft of water will make many harbors unaccessible to her; whose superior speed, if she steams in squadron, will have to be reduced, and whose size impairs her maneuvering qualities is not yet clear, but there seems to be a popular notion that her main function, regardless of circumstances, is to seek out and destroy somebody else's monster. As if the days of naval duels of the "Constitution" and "Guerrière" type, which never decided wars and never will, had not long since gone by. Naturally the concentration of the public mind on a single extra-big ship rather withdraws from view the peculiar skill which handles an aggregation of smaller units to the best effect.

Again the size of the whole navy has been a more or less absorbing issue which has tended to put in the background the question of admirals. Between the extremists on the one hand who have demanded a fleet greater than that of any other nation, and those on the other who have merely wanted a small ocean police, all shades of opinion have found room, and there have been many to insist that until this was settled we had better bear the admirals we have than fly to others that we know not of. But the President's unexpectedly moderate proposal of only one battleship per year and that merely to replace the vessel in existence nearest to obsolescence, for the present, at least, is a quietus; and we can safely assume that what we want, and want as quickly as they can be got, are admirals competent to handle the fleet as it is, regardless of what it may be. Now let us marshal our assets.

We have the Personnel Board's scheme, commended by the President, but even if taken up by Congress at all this session likely to go over in interminable debate, if not to be choked by obstruction in the Senate.

We have also a proposition to create three vice-admirals. Vice-admirals have various uses, but touching the present question, inasmuch as they are to be taken from the existing source of supply, it is not evident that they will know any more in the higher grade than they did in the lower.

We have certain officers among the existing admirals and captains—one admiral in particular—who, by common consent of their fellows, know theoretically much more naval tactics than the others and, indeed, have a natural bent that way. The particularized admiral happens to be one of the youngest, and his available term of active service, short enough at best, is double that of the average, or nearly three years. Common sense would indicate utilizing him at sea at once. Official sense sends him to waste his time attending the Hague Peace Conference, which isn't his business.

We have a peculiarly fine lot of lieutenant commanders—mostly men who have been in the service a quarter of a century or thereabouts—and are in their forties. These have not had to devote the beginnings of their lives to filling their heads with sail and spar seamanship, and the ends of them to forgetting it so as to let the new things in. They found the problems of the new navy waiting for them when they got out of their professional swaddling clothes. They are the men we have got to depend upon, and the quicker we get *them* in train for their real future work the better.

By no means all of the important innovations in the navy have been made in the first instance by Congress. Many—the establishment of the Naval Academy for instance—were done and finished long before Congress was asked to authorize them. That body has a way of accepting accomplished facts when they are successful.

Wherefore and by way of conclusion it is submitted.

1. That there is not only no further use of wasting time educating as admirals and captains, officers whose period of active service is too short, but that to con-

tinue doing so any longer is to keep in needless peril the national safety.

2. That lieutenant commanders should be sent at once to the command of battleships, to start their experience in full command now. As lieutenant commanders are always second in command on such ships no great upheaval—other, of course, than the to-be-expected sentimental one—need occur. Any lieutenant commander who for a two years' cruise has been a successful executive officer, ought to be and undoubtedly is fitted to take over full charge of his ship. The seniors in this grade have fifteen years or so of active service ahead of them—plenty of time for education in command and flag ranks. It is safer to assume that they know their profession after twenty-five years' service in it, and that we shall suffer less by letting them skip their intermediate gunboat and cruiser commands than by leaving matters as they are.

3. The fleet and squadron commanders—admirals—should be chosen from all the existing active admirals, captains and commanders, and should be the men who by general service consent—really not difficult to ascertain even without a Board of Five Rear Admirals of Great Seniority—are best suited for the work and who have fairly long periods of time to serve before retirement. There is nothing particularly sacred in regulations whereby specific duties are attached to the several grades. Their alteration is conceivable, and the President could doubtless find authority enough if he saw fit to order even a lieutenant to take charge of a fleet. It is not proposed, be it clearly understood, to confer advanced rank, but advanced duties. Or, in other words, to send people to do work and to become educated in it, who are competent not only to do it now, but have the years before them to grow up to the highest skill education can give. Their titles are of no consequence. A midshipman if commanding a battleship would be called captain anyhow; and what with dock builders, bookkeepers, physicians and even clergymen nowadays usurping the military title of admiral, it is an open question whether we had better not leave it to them altogether, and give back to the real naval officers the fine old style of commodore.

4. The General Board of the Navy and War College should be set at once to prepare complete plans for battle tactics, and the commanders-in-chief ordered to keep their fleets at sea practicing them until the highest possible proficiency is attained.

With young men in command and squadrons pitted against squadrons, the emulation will be intense and healthy. Those who lose in the mimic fights should be sent back to the subordinate duties of their grade. Those who win, retained or advanced. Let us have young captains on the battleships now, and skilled admirals will follow in the shortest possible time.

NEW YORK CITY.

"She Is Not Dead, but Sleepeth"

BY EDWARD N. POMEROY

THE Master saith, "She is not dead, but sleepeth";
Her hands demurely folded on her breast,
Whoever worketh and whoever weepeth,
From toil and grief exempt, she is at rest.

She slumbereth too deeply to be dreaming;
No track of trouble mars her placid brow;
The sunlight on her face serenely streaming,
Nor tears nor laughter she regardeth now.

Her early passing deem not a disaster;
Her birth was gentle, but the world is wide;
No further vex the patience of the Master;
Be it sufficient she hath lived and died.

"Let her arise. Whatever may befall her,
Whatever joy and grief before her lie,
To meet and measure them I will recall her;
Better for her to live, for Me to die."

WELLESLEY, MASS.

The Suppressed Evidence of the Kongo Commission

BY JOHN H. HARRIS

[Altho King Leopold refuses to allow the publication of the testimony taken by the Kongo Commission, some of whose sessions were attended by the writer of this article, yet the knowledge that such evidence is in existence has caused his administration to be sharply criticized, even by his own subjects. Mr. Harris was a missionary in the Kongo and speaks from first-hand information.—EDITOR.]

IT will be remembered that the Acts of Berlin and Brussels, by which King Leopold became mandatory for the Powers, were framed to secure two conditions.

1. Freedom of commerce for all nations.

2. The bettering of the conditions of the native peoples, as well as the protection of their rights.

It is now conceded even by the King's apologists that the first has been flagrantly violated, for thruout 800,000 square miles of upper Kongo territory "the State can prosecute as a poacher any one who takes from the land the least of its fruits, or as a receiver of stolen goods any one who receives such fruit." *Vide* the Report of King Leopold's Commission.

The main controversy, however, has been waging round condition No. 2. All doubt on this was set at rest by the publication of the report of King Leopold's Commissioners. True, all the evidence upon which that report is based is completely suppressed, but the period of doubt and wholesale denial is ended.

For some years statesmen in different countries have declared that apart altogether from "atrocity" reports they were convinced that King Leopold's system must be responsible for the gravest abuses.

Briefly, what is this system, so "unique in its conception, so marvelous in its results?"

It must first be borne in mind that the produce of the forests of Africa is the only means whereby the natives can secure the produce of civilization, therefore if the native is robbed of that produce all means of bettering his condition are removed from him. King Leopold has by a stroke of the pen written off the whole of the forests as the property of the State, not only the forests and their produce, but the very animals that roam those forests. In the event of "capture or death of an elephant . . . the animal must be handed over to the District Commissioners." *Vide* Commissioners' report.

This was the first act in this piratical system. When once this step was taken, others followed and in quick succession. The vast territories were parceled out to concessionary companies for exploitation. Some are administered directly by the State (which is King Leopold) and others by boards in Europe, but in all these the State holds the largest number of shares and receives not less than 50 per cent. of the profits. On the Kongo they are administered by subordinate whites, who receive bonuses on the amount of rubber and ivory they are able to extort. The instructions to the officials are illuminating. The following was received by one M. Tilkens:

"I beg to bring to your notice that from January 1st it is necessary that 4,000 kilos (4 tons) of rubber be furnished every month. To ensure this result, I give you *carte blanche*. You have two months in which to work your people. Use gentleness first of all, and if they persist in not accepting the State's impositions, use armed force."

In order to force the natives to bring in the forest produce, certain powers are legally placed in the hands of all white collectors. Each white carries a license signed by the Governor General authorizing him to practice "hostage-taking" or the capture and holding of villagers until they are ransomed with forest produce.

But how are these captures to be effected? The white cannot carry them out because the entrance into a village of "Bondele wa Botofe" (rubber man) is always the signal for a stampede, the natives seeking the depths of the impenetrable forest as hiding places. The white cannot follow, therefore he is allowed to employ auxiliaries in order to capture hostages. These sentinels are uncivilized and in many cases cannibal or semi-cannibal, chosen from tribes remote from those over whom they are placed; into their hands are put weapons and pouches of cartridges.

The most favored method of employing these auxiliaries is that of sending them, ten to forty at a time, to raid a village for prisoners whenever the fortnightly demand of rubber is short. The inevitable effect of this system is forcibly described by the King's Commission:

"These auxiliaries, especially those stationed in the villages, abuse the authority conferred upon them, convert themselves into despots, claiming the women and the food, not only for themselves, but for the body of parasites and creatures without any calling, which a love of rapine causes to become associated with them, and with whom they surround themselves as with a veritable bodyguard. They kill without pity all those who attempt to resist their exactions and whims."

In order to illustrate the foregoing, I take the following extract from my diary regarding a raid which was known quite well to me in detail from several other witnesses, whose depositions are in my possession and also in King Leopold's.

Conversation with Inunga:

Q. You were in the raid on B——, were you not?
R. Yes.
Q. In what capacity?
R. I carried some of the sentinels food.
Q. Why was Isekitoki's raid sent?
R. The rubber was insufficient, so three days after they had brought the rubber M. L. sent Isekitoki, and also called up the State force.
Q. Where did the two white men meet?
R. In B——.
Q. Where were the B—— people (villagers)?
R. They were hiding (in the forest).
Q. What did the sentries do?
R. They followed and killed, and then brought the corpses into the town. The M—— people and others cut them up and ate them.
Q. Did the white men see them eating the corpses?
R. Yes.
Q. Did you see them?
R. Yes.
Q. How many corpses did you see?
R. First they killed three in one spot, and brought them in to eat; the next day they went again to kill, and killed six and caught five prisoners (hostages).
Q. Were many killed in the forest?
R. Yes, very many.
Q. What did they do with the viscera?
R. Some they stretched on the trees in the forest, and others they stretched across the path. We took the heads and impaled them in the forest.
Q. Did the white man order this?
R. The white man said, "Destroy their corpses, and then the relatives will bring rubber quickly."
Q. Were any women killed?
R. I saw three women killed and also saw them being cut up.
Q. What ages do you think they were?
R. One old woman and two young ones.
Q. Were any children killed?
R. I did not see any with my own eyes, but the others said they had killed a large number. L—— asked the white man to give them salt to eat with the corpses, but he gave them only two large spoonfuls; most of them had brought salt.
Q. Had these fighters any other food with them?
Q. No, they dug up manioca, and also took it from the spring. They had that and human flesh only.
Q. When the chief promised to bring rubber, how many baskets was he told to supply?
R. Two hundred (per fortnight).
Q. Did the M—— and other spearers eat all the "meat" at B——?
R. Some they ate, and others they dried and brought back with them.
Q. Did the white man pay the fighters?
R. Yes, a cup of salt each.
Q. Had they no loot?
R. Yes, beads and anklets that they took from dead women.

Outrages such as the foregoing have been reported first from one part of the Kongo territory and then from another, and it was this continuous stream of testimony that led Lord Lansdowne to send Roger Casement, C.M.E., into the Kongo to investigate.

The Casement report is, perhaps, the most damning indictment ever made against another State. King Leopold, however, did not hesitate to stigmatize it as untrue, and subjected the British Government to thinly veiled insult.

In spite of this attitude, the Kongo sovereign was forced to send out a commission of inquiry. This was composed of three gentlemen, one a Belgian, one a Kongo State official, and the other a Swiss. As one who watched this commission at work for many days, I must admit that they were fair in every way, but it must be borne in mind that the men

had to report not to the world, but to King Leopold. This they did in March last, but for over seven months that report was held back. At last such portions as King Leopold chose were allowed to appear. These, however, contained merely the findings of the commissioners; the depositions of the witnesses were absolutely suppressed.

This is not surprising, because had they been made public an irresistible demand would have been made for the prosecution of highly placed officials. Considering, however, these men hold specific instructions from the King, the difficulty of prosecuting them is at once apparent. Moreover, it is emphatically asserted on the Kongo that at least one of the high officials is of the same blood of King Leopold.

Another reason for the non-appearance of these depositions is that no printer could publish the horrifying and reeking tortures to which some of the women have been subjected, and these not always by the King's black "sentinels," but by the white agents.

The report then, tho lacking the most instructive part, confirms the truth of the allegations that have for years been leveled against the Kongo administration.

We are told if King Leopold had been able to reform the Kongo administration he would have done so long ago. In this the Kongo reformers quite agree. It is now two years since Consul Casement went into the Kongo State to investigate, but no cessation of pillage or murder has been brought about; even the last mail from the Kongo added to the long list of horrifying outrages.

For years those acquainted with tropical administration have felt that such a system was incapable of reform, and it would seem that the public at last is beginning to grasp the fact. The only way to end the Kongo horrors is to do away with the cause; not the branches, but the roots must be cut away, namely: The removal of the absolute claim to the soil and its produce, and the labor of the people.

There is one great element of danger in sweeping away this system. There is a great army of black soldiery, numbering, regulars and irregulars, 30,000. For years this body of men has been indulged and kept quiet by almost unlimited power to loot, whenever and wherever they liked. Now, it is obvious that to start repressing such an army is a very ugly undertaking. This is made the more so by the unification of language. Formerly only sections of this army mutinied, but during the last few years one language has been used. This, while facilitating the work of the non-commissioned white officers, has had the effect of uniting the army. This body of men make no secret of their intentions if any attempt is to be made to suppress their looting propensities.

Viewing the situation as a whole—the obliteration of trade from the Kongo Valley, the admitted inhuman treatment of the natives, the grave internal dangers—it would seem that it is the duty of the Powers signatory to the general acts of Berlin and Brussels to come together in conference and discuss the situation. That these Powers have that right is indisputable. First, because those acts have been grossly violated, and secondly, because that right is specifically laid down in Article No. 36 of the General Act of Berlin: "The Powers signatory to the present General Act of Berlin reserve to themselves the right of bringing in such modifications, the utility of which has been shown by experience." There are several potent reasons why this action should be prompt, not least among them the fact that the conditions now in Kongo are getting worse. The Powers will be forced some time to act, but the longer that action is delayed the greater will be the task.

There must be international adjustment of these serious conditions. The only tribunal which can try King Leopold is the interparliamentary union which created this great International Trust, and appointed him Trustee; or, as Baron Fitzmaurice, the present Under Secretary for Foreign Affairs and the present English administrator, remarked some few months ago: "What the Powers created they can uncreate."

Let the arm of the Christian world be stretched forth in its might and grasp this murderous hand, and this system of pillage, murder, outrage and extortion will be removed from the Kongo forever.

ATLANTA, GA.

Leguminosæ: Another of Our First Families

BY E. P. POWELL

Author of "The Country Home," "Old Farm Days," Etc.

I AM at a loss to determine which member of this family deserves leadership, for recently some of the more insignificant have become world important. The word "legume" has come into every one's mouth, possibly without a clear apprehension of its meaning. The present outlook is that the productive interests of mankind will in the future depend more upon the legumes than upon any other form of vegetation. Under this general head we have not only our beans and peas, but our clovers, and some of our lawn and shade trees, of more or less importance. New England brought the common bean into fame, because it was so well adapted for Sunday use, when cooking was held to be irreligious on the holy day. The dish of baked beans was so very universal among our fathers that not to "know beans" was the most contemptuous phrase that could be applied to any member of the community.

Under the general head of legumes we have at least seven thousand species of plants, and the very largest proportion of these are useful as food for man or for his domestic animals. The number of varieties of beans alone goes up into the hundreds, and includes some of the choicest foods for our table. Perhaps the lima bean stands at the head of the list. By cross-breeding I have produced and tested several hundred new varieties. As usual with new productions, most of these showed no marks that qualified them to secure a permanent place in the garden. Perhaps a dozen are really superior, while not more than half that number deserve general dissemination. It was a very difficult matter to break into the heredity of some of the conservative old stocks, like the lima, and compel them to breed with the less aristocratic. Such crosses, however, were obtained, and the result has been to combine the qualities of the lima with the greater hardiness and prolific qualities of other varieties.

In our gardens beans drop into two groups, those that climb and those that hug the earth. For the amateur gardener, who has little time, and cares to avoid expense, the bush beans are best; but most of the very choice sorts must be poled and frequently tied as they climb. I have never succeeded better with the lima than by growing it on a trellis, at the edge of my garden, and allowing the trellis to lean against the bordering fence. It was supposed at one time that beans would grow on any soil, and of excessively barren land it was said to be "too poor to grow beans." It is now understood that good, rich soil is required to grow fine, fat beans. There seems, however, to have been in this popular saying a dim appreciation of the fact, recently discovered, that the bean had some way of taking care of itself that other plants have not. Science has recently found out that the whole legume family has a specific method of taking a part of its nourishment directly from the air. The roots have little tubercles, scattered along the fibers, caused by and infested with bacteria.

These bacteria are always present, but they multiply more rapidly in good soil. They are minute bodies, branching out into many forms. The branches become nodulated, and these nodules feed directly upon the nitrogen of the air. While other plants are compelled to find their nitrogen in the soil, thru decomposition of manures, the whole legume stock, by means of this peculiar root system, gets its supply from the atmosphere. As a consequence the bean is not only largely independent of manures, but it fattens the soil instead of exhausting it. This is true not only of the beans, but of the peas, the clovers, the cow peas and many legumes not known in our Northern States. For this reason also the Kentucky coffee tree and the honey locust and the mimosa may be grown for shade where it is desirable to retain a good turf, while the ash and the elm and the maple will soon prevent the grass from finding nourishment.

Pure cultures of this nitrogen-hunting substance are called nitragin, and are sold to farmers whose soils are deficient in these specific micro-organisms. Soil inoculated with these cultures is in condition to furnish alfalfa or any of the clovers, where before they could not be produced. It is an important fact that these legumes may then be grown on the same land for successive years without exhausting it; on the other hand, they are constantly increasing the foodstuff contained in the soil. Used as cover crops, and then plowed under, the nitrogen is left in the soil for other plants to feed upon. Some species possess bacteroids peculiar to themselves, but in other cases the same bacteroids are common to two or more varieties. They are distributed thru the soil by the action of the cultivator, and to some extent by minute currents of water. Here we have one of the most wonderful provisions of nature for recuperating worn-out soil—restoring exhausted corn lands and wheat lands to fertility.

One of the most remarkable members of the legume family is the cow pea. This is peculiarly a gift of nature to the Southern States, altho a few varieties will thrive anywhere in the corn belt. In reality it is a bean growing on a rambling vine. In the North it is used mainly as a cover crop, but in the South it gives a heavy yield of hay, may then be used as a cover crop, and finally plowed under. Here we have a triple value; the hay itself being of excellent quality; as a cover crop it is an important winter protection in the orchard; and again the stubble adds a vast amount of humus to the land, and the roots furnish the nitrogen. A cover crop is simply a crop sown in the latter part of the summer—generally after some early crop has been removed. This is allowed to remain thru the winter as a cover to the roots of trees. The more advanced orchardist does not think of growing peaches, pears, or even apples, without seeding down his orchard with a cover crop—a blanket over the roots of his trees. This cover crop is plowed under in the spring to give humus to the soil and nitrogen to the trees.

No plant has startled the world more for its general availability to furnish food for domestic animals than the alfalfa. This is that one of the legumes which is adapted to the widest range of climate, and is about equally good for horses and cows. Its palatability is reckoned as about equal to that of corn. It thrives especially in limestone soils, and needs only to be fed with a small amount of phosphorus and potash—it will get its own nitrogen from the air. In Colorado and New Mexico it will give four crops in a season, and in New York it will give three. So large is the amount of its vegetation that a poor man can feed his horse from a single acre and have a fair lot of feed laid away for winter. As a cover crop it is hardly surpassed by any other plant, furnishing a splendid carpet of foliage during the winter. Plowed under in the spring, alfalfa furnishes a very large body of humus for the soil, besides a big storage of nitrogen. The stubble and roots, of a mature growth, are estimated to contain fertilizing constituents on each acre to the value of $35. Nor do we yet count up all the remarkable work done by alfalfa until we note its mechanical effect in deepening the soil and preparing it for subsequent crops of other kinds—its roots often running from ten to twenty feet and sometimes farther. All in all, it is the grandest gift of the nineteenth

century to our forage plants and general farm values.

The farther south we go the more we find legumes to abound. No State in the Union more needs some provision for making and mending soil than Florida, and in no State has nature been so provident and generous to furnish what is needed. No farmer needs to undertake agriculture in this tropical part of the country unless he first masters the legume problem. He will find them in the form of minute plants, frequently covering the soil, and from these up to plants that make an annual growth of twenty or thirty or even fifty feet in a season. Among these are the cow peas, and to some extent the crimson clover. The soya bean and the beggar plant are exceedingly important. The last of these was for many years known only as a pestiferous weed, the plague of cotton growers, but is now considered one of the most valuable forage plants in the State; useful for all animals, but especially liked by the horse. It is a legume adapted to almost all the sandy and barren soils of that vast State. But the story is not half told until we consider the qualities of a very remarkable plant, brought into Florida as an ornamental vine. It certainly is an ornament, grown over the doorway or porch of a cottage; but after a few years it was demonstrated to be of far more value as a forage plant. It will not grow at all in the Northern States, and is not worth the planting in the Gulf States, but in Florida it makes an annual growth of fifty to seventy feet, and this it will do even in the poorest sand. Its capacity for storing nitrogen is enormous; it is, however, of equal value to the land for the quantity of humus that can be plowed under, after several crops of hay have been mowed and placed in storage. The velvet bean, as it is called, is simply a bean of about the size of a garden cranberry bean, but is a special gift of nature to the tropics. With this plant alone one may transform barrens into rich fertility, altho to its aid may be summoned the vetches, the soya bean, the beggar weed and many more legumes—all nitrogen gatherers. These plants take their food directly from the air and add it to the soil.

Of course, no gardener will let us pass by the pea in our enumeration of the valuable legumes. Good green peas are the glory of a country garden. One would be warranted in seeking the country for a home, if for nothing else, to find out the capabilities of the wonderful bean family to please the appetite. A snug little farm home can secure a succession of delicacies of this sort all summer. I have not only my green peas until the last of August, but my string beans, from my own cross-breds, clear down into November. I break down a few poles, so that they will lie close to the ground, about the time that the early frosts begin, and when needed throw over them an armful of hay or some other easily lifted covering. In this way the most delicious of all the vegetables, the string bean, can be had until hard freezing weather begins. The lima can be treated in the same way to give us the best of shell beans. A thoroly good list of peas can be made out without including a single variety that needs brushing. Among these I include as indispensable May Queen and A No. 1—as thin skinned as they are deliciously sweet. To these you can add Market Master, Prosperity, Hero and Improved Pride of the Market. This garden pea is one of six varieties of a single division of this great family of legumes. It reaches us from Asia, coming around the Mediterranean, and cultivated along the route for at least three thousand years. The Chinese have many varieties that we are just beginning to introduce. The average value to the farmer and gardener of these legumes brings his garden stuff to about $150 per acre, while the cereals do not net him more than $10 to $15 per acre.

Nearly all our first families in the vegetable world are as generous toward beast as toward man. This is particularly true of the legume family. Beside the fodder value of cow peas, field peas and beans, with vetches and velvet beans, we have the clovers in all their rich varieties, set apart by nature to feed the bees and the birds as well as the animals. Nor must we overlook the fact that they all contribute an immeasurable sum to the intellectual pleasure and profit of human beings. I have never enjoyed a ride on a railroad more than thru the great meadow lands of Michigan when clover was in full

bloom. The dew-moistened hours were full of volumes of perfume, that roll for miles over the land. The sensation produced is peculiarly nerve resting. The clovers are said to be great producers of honey. I do not think, however, that the honey-bee works very extensively in any of our clovers where the linden and raspberry flowers are abundant.

Nor even yet have we recounted all the glory of this family. It is not confined to garden plants and meadow crops, but lifts its head high on our lawns, in some of the most beautiful trees that we possess. The Kentucky coffee tree is, among these, the most unique, delicious in flower; and its huge pods hold seeds that may be used for coffee. If you wish to know the full witchery of a moonlight evening, stand underneath a gleditschia or honey-locust, and let the moonbeams sift down thru the delicate foliage. Asked why I allowed a great (but thornless) acacia to grow in my berry garden, I answered that it was in part to enrich the soil. With limbs trimmed high enough to prevent shading, this tree will do no harm to its neighbors, if it does not in fact feed them. An ash tree in the same position will exhaust the soil for a diameter of fifty feet or more.

Look over the range of this whole family, and, while you cannot say that it is more important to man and beast than the corn family or the rose family, you will be more and more amazed, not only at its economic importance, but at the complex problems which it helps us to solve. It reaches down to plow the soil deeper than any other family of plants; it reaches higher in the way of analyzing atmospheric elements; and it does what no other family of plants can do, it enriches the soil instead of exhausting it. It is of growing interest from the scientific standpoint, and of growing value from a food standpoint. The species and varieties have now become so differentiated that crosses and recrosses are liable to produce something important and novel at every turn. Alfalfa even is being improved, and we shall probably have improved sorts of velvet bean. These first families of ours would hold their rank less high if they could not make progress.

CLINTON, N. Y.

To a Sea-Gull

BY L. N. CHAPIN

THY strong wings fly Atlantic's sky,
A thousand miles from land;
What power provides, what compass guides,
We faintly understand.
Dost thou not fear thy course to steer
So far from cliff and strand?
Oh, hasten home, no longer roam,
A thousand miles from land.

Soon the dark cloud of night shall shroud
The sea from east to west;
The storms that fleck the deep shall wreck
The pilot in thy breast;
Thy wild mates fly in yon safe sky,
By cliff and scar and sand;
Oh, hasten home, no longer roam,
A thousand miles from land.

My soul, like thee, is out at sea,
A thousand miles from land;
I fear to sail, I dread the gale,
I shrink at His command;
Oh, share with me strong wings at sea,
Thy nest within His hand;
Then shall I roam, nor fear the foam,
A thousand miles from land.

[illegible], N. Y.

Literature

The Documentary History of Reconstruction

It is hard to know whether to treat Professor Fleming's new work* as an outline history, a topical bibliography, or a source-book on reconstruction, since it possesses something of each of these characters, and yet is not wholly subordinate to any of them. It is imposing, well printed, and redolent of careful, active editorial supervision, yet we cannot but wonder for whom it is intended and by whom it will be used.

As to the purpose of the monumental enterprise, of which we have the first of the two volumes before us, the author is himself entitled to be heard. "To make more easily accessible to the student and to the general reader some of the original sources relating to the Reconstruction period," he states to be his aim; his title page speaks of political, military, social, religious, educational and industrial conditions from 1865 to the present time; and to these phases of life during the first four years of his period he devotes a volume of four hundred and ninety-three pages. We turn to his volume with grateful anticipation of the services which it promises to render, for we know Professor Fleming as a faithful worker in the field of reconstruction, and the most active of that group of scholars which Dunning of Columbia has in recent years directed toward the history of the South. We leave the volume with a fear that neither of its two classes of readers can be content with it.

The careful student, as well as the general reader, needs a book different from this. The former can never be satisfied with a volume of pre-digested sources, however worthy may be the master mind of their editor. He can use systematic collections of complete documents, or careful editions of isolated ones; but selecting and excising is the work of the historian in preparing his finished literary product, not that of the editor in gathering the raw materials. Professor Fleming's collection will be invaluable to him when he comes to write his own great history of reconstruction. It can never be of fundamental value to another scholar.

The general reader will also be disappointed in the book, for it is too large for his needs; it is too scrappy and detailed; and the threat of another volume to follow may well frighten him as he starts to read it. For him a source-book should be briefer. For the special student it should be more systematic and less shaped to the editorial opinion. For neither is the present work perfectly adapted.

And yet this *Documentary History of Reconstruction* represents much conscientious labor and materials of great historic value. We are satisfied that its editor knows the reconstruction sources as probably no other historian does. In using his work the student will derive much profit in spite of the minute logical analysis which breaks up the constituent documents into tantalizing fragments. He will regret that the arrangement is as it is, and grieve over an opportunity of which the most has not been made, but he will, nevertheless, be thankful for that which is set before him. There has been so little done on reconstruction that is worth while, that no serious contribution can fail of value.

The six chapters of this first volume deal with the South after the war, theories of reconstruction, reconstruction by the President, race and labor problems, the Freedmen's Bureau and Bank, and Congressional reconstruction. It covers the years 1865-1868. Every chapter has a brief historical introduction, a topical bibliography and a collection of extracts grouped in analytical array. The materials from which the extracts are drawn include Federal and State laws and public documents, newspaper articles on both sides, contemporary opinions expressed by travelers of all sorts and unpublished manuscripts. It would be more accurate to call the volume a note-book on reconstruction than a documentary history.

* The Documentary History of Reconstruction. *By Walter L. Fleming.* Vol. I. Cleveland: The Arthur H. Clark Co. $5.00.

The Viper of Milan

It is to be hoped that the number of infant prodigies we produce these days is not an indication of the approaching senility of the race. Still when little boys of three years can decline their own personal pronouns, and little girls of eighteen do write wonderful books, it is time to be alarmed. We had a case of this kind several years ago in New York when Bertha Runkle wrote the best selling novel of the season. But now Marjorie Bowen has surpassed her in two particulars, she is younger by a couple of years, and she has written by all odds a better story.*

Otherwise there is a remarkable similarity between them. Both are daughters of literary mothers. Both wrote historical novels and laid the scenes in countries where they had never been themselves. Miss Runkle chose Paris during the sixteenth century, and Miss Bowen has given us a tale of Lombardy in the fourteenth century when the Visconti Gian Galeazzo Maria was Duke of Milan and horrified the world with his fastidious cruelties. It so happens that this elegant monster has figured in another novel this year, "Bembo," which was written by a much more mature author, but to read the two no one would think so. There is little obvious evidence to prove the youth of Miss Bowen beyond a young person's natural preference for the up-and-doing nominative case, where older, more subjugated minds would have yielded to the grammatical demand for the objective case. These faults in grammatical construction are so apparent indeed as to give the impression of having been granted for a purpose. But reading shrewdly between the lines the following evidences of the author's youth and immaturity are to be found: She does not know the country, she has only heard about it, and so, while her literary style is pictorial to such a degree that the book contains some of the best descriptive writing to be found anywhere in fiction, the topography of her story is vague. Neither does she make any attempt to reconstruct the shell of the age historically, but she is concerned to tell merely this particular story which appears to touch it only in dashes of color and a skirmish here and there. And while her dramatic genius carries it forward with astonishing splendor and swiftness, there is no stirring of the deeper human consciousness or conscience. The Visconti passes without a qualm from one imaginable crime to another. And the author tells of his madness, rather than his remorse, because she does not conceive of it. She is still in the fairy tale stage of intellectual development, when youth secure in its own life has no conscience in cultivating a blood-curdling imagination. Neither is there a hint of the dissolute love-passions of the age. The chastity of the book is really wonderful in this particular, and can only be accounted for by the fact that the author's own sense of sex was not sufficiently sophisticated or brazen to portray a feature so obvious that a more mature artist could not have omitted it.

And finally, she is so young and hopeful that she has dared an unhappy ending, not the melancholy unhappy endings which depress, but one in which evil is as triumphant and spectacular as good as usually represented to be. The effect therefore is startling rather than depressing. And when all is told there is no attempt to excuse or justify. There is not a philosophical sentence in the book, not a single appeal to religion, it is simply a gorgeous fairy tale of human life with a diabolical hero, worked out thru every imaginable irony of circumstance, and considered within these limitations, it is almost beyond criticism in style, construction and fascination.

* THE VIPER OF MILAN. *By Marjorie Bowen.* New York: McClure, Phillips & Co. $1.50.

Recent Theological Opinion

THE doctrine of Dr. Gordon[1] is that the heart of all things is to be found in the character of Jesus; that Christ is the interpretation and issue of the soul of the universe; and that therefore, since "the universe consented to his existence, and was able to give him his existence, it must be as good as its best issue." The central thought of the book is that the way to God is thru the revelation made in the life and character of Jesus, or as Dr. Gordon expresses it, "We ascend to

[1] THROUGH MAN TO GOD. *By George A. Gordon.* Boston: Houghton, Mifflin & Co. $1.50.

God thru man and his sovereign leader." Here may be seen the basis of the criticism of the late John Fiske's "Thru Nature to God," which suggested the title of the volume. It may be questioned whether this criticism is justified, for man was certainly a very large part of nature as Mr. Fiske interpreted it. What may be termed Christocentric theology, of a modern and progressive sort, has a virile exponent in the Pastor of the Old South Church.

Professor Beckwith's volume[2] might have been entitled "Thru Life to Truth." He betakes himself to experience as the source of Christian doctrine, and employs the Scriptures as a witness to religious experience rather than as a storehouse of Christian dogma. His object is to construct doctrines that are certainly vital and real from the facts of life to which the saints of the Christian ages bear testimony. This method has a radical sound, but the doctrines which Professor Beckwith derives from the use of it are not heterodox, nor are they conceived and stated with the clearness of insight and firmness of grip on fact sufficient to make them either clear, or interesting, or forceful.

Professor Beet's *Manual of Christian Theology*[3] expounds the views on the intermediate state which brought him into difficulty with the English Methodists some years ago, but otherwise it follows well-worn paths to conclusions which are now familiar and trite.

Mr. Brierley is the editor of the *Christian World,* of London, and the thirty-four papers comprising the volume entitled *The Eternal Religion,*[4] appeared first in that publication. They are worth preservation, for Mr. Brierley is a forcible and suggestive writer on religious themes, whose productions bear study and re-reading. We know of discerning clergymen who value his books highly and find them stimulative of earnest thought. He has the faculty of opening up a subject and enticing one to further investigation, never saying quite all you wish he would say, but leaving you wondering what ought to follow. He is not a writer for the lazy-minded, who wish all their thinking done for them, but his sincere candor, his large store of information, his wealth of happy illusion, recommend him to sincere lovers of truth. His outlook is broad, his sympathies are wide, and if more who write and speak on things religious were possessed of his spirit and his insight we would hear less of alienation from the Church, both of the learned and of the masses.

The Masterful Hand in Egypt

Those who believe, within the limits imposed by a respect for the United States Constitution, that it is the destiny of the English-speaking peoples to hold the best parts of the earth, and elevate the inferior races, will read with interest *The Making of Modern Egypt,* by Sir Auckland Colvin.* The book is not exactly either literature or journalism; neither very serious nor very engaging; it is but a well-written digest of official reports, skillfully edited by a "Financial Adviser" who had a fair share in the "making."

In one sense the volume is an apology for the British occupation of Egypt, which, however justified in the end, was highly irregular in the beginning; and which still presents the anomaly of a European government administering the African estate of an Asiatic ruler. Sir Auckland excuses the ignorance of stay-at-home British Cabinets, eulogizes the administrators on the spot, and frankly admits the difficulties, past, present and future, that beset the handful of aliens who were, and are, convinced of their mission to reduce chaos to order in Egypt, who have already displaced the camel by the electric car, and stretched the civilizing telephone wire along the Nile.

In 1883 the Turkish rule in Egypt was merely nominal, and she was threatened with rebellion, insolvency and hordes of Dervishes. The people were overtaxed, irrigation had been neglected, there was graft in every department, and the only visible patriot was the of-

* The Making of Modern Egypt. *By Sir Auckland Colvin, K.C.S.I.* New York: E. P. Dutton & Co. $4.00.

fice-seeker. The British navy put an end to Arabi's rebellion; skilled British and French financiers adjusted the fiscal problem; Egyptian troops under British and native officers annihilated the Khalifa; Anglo - Indian engineers, building on French foundations, have controlled the overflow of the Nile; and education, strict justice and efficient policing are making even the Arab honest.

The process has been like mending a watch without stopping the works. The program, we are told, was at first economy, then the remission of taxation and lastly the spending of available surplus to increase the productiveness of the soil. Much of the land of Egypt, which means, in the words of the ancient proverb, the fields overflowed by the Nile, now yields two crops a year, and the new dam at Assuan is increasing the area under cultivation. The principal crop is cotton. In 1884, Egypt exported cotton valued at $38,000,000; eighteen years later the amount had risen to $83,000,000. In 1884 the total imports of Egypt were valued at $40,000,000; in 1904 they were $100,000,000.

Egypt is now in a fair way to settle with all her creditors, and by 1915 she will be practically free. In 1881 she was bankrupt. The coupons were overdue; foreign bondholders were within the gate, and international control was being established; the Caisee de la Dette Publique was taking mortgages on every source of revenue, and the dual control of France and England threatened to lead to war. When Lord Cromer arrived in 1882, Egypt could not borrow a penny even at 10 per cent. But failure was not in the program. In the ensuing eighteen years the Egyptian Treasury has raised and expended nearly a billion dollars, of which $465,000,000 went to the foreign bondholders and the Sultan of Turkey; $60,000,000 was needed for military expenditure; about $50,000,000 for irrigation, sanitation and public works; and the Khedive's civil list took $30,000,000 more. The reconquest of the Sudan, not counting expenditure on railways and telegraphs, cost the Egyptian Government less than $6,000,000, in addition to the $3,500,000 contributed by the British taxpayer. In other words, this formerly insolvent state has contrived to raise an average of $55,000,000 a year from a population of 9,000,000, 88 per cent. of them illiterate, and at the same time the native's tax burden has either been lightened, or he has been placed in a better position to bear it. There is financial equilibrium and "the economic margin fructifies in the pockets of the peasant." The causes which, in the velvet phrase of Lord Cromer, "have led to the decadence of so many Oriental states," are being offset by a persistent policy of decentralization, which recognizes "a remote potentiality for self-government." Agriculture is flourishing, industrialism is fostered, there is nothing to fear from either Khartum or Paris, even the Sudani is learning the alphabet of progress, and the Valley of the Nile is secure from the Equator to the Mediterranean.

The Text of Shakespeare. By Thomas R. Lounsbury. New York: Chas. Scribner's Sons. $2.00.

Prof. Lounsbury's title is rather misleading. It is hardly a fair index to the contents of his book. That book itself is the third of a series, the so-called "Shakespearean Wars," dealing with the controversies to which the work of the great dramatist has given rise. The two former volumes are devoted to such of these disputes as were literary or esthetic in their character; with the present volume the quarrels of the textual critics begin. So far the subject tallies with the title. But as a matter of fact the interest soon shifts from Shakespeare to center in Pope's enmity for Theobald, whom he detested for his superiority as a Shakespearean critic and whom he undertook, not unsuccessfully, to gibbet in the "Dunciad." In this sense Prof. Lounsbury considers the "Dunciad," as originally written, "a Shakespearean document pure and simple." As such he proceeds to tell its story, for the first time, as he says, in its entirety and to extricate Theobald's reputation, as far as may be, from the falsification and misrepresentation with which Pope has been instrumental in involving it. To students of the period the exposure of Pope's shabby and unscrupulous dealing will cause no particular surprise; his character is pretty well un-

derstood by this time. It is desirable, however, that his obscure and subterraneous transactions should be unearthed and his falsehoods corrected. In this respect Prof. Lounsbury's volume is a contribution to the literary history of the eighteenth century. His sense of Theobald's injuries may be rather exaggerated, for Theobald's scholarship is coming to be pretty generally recognized nowadays; his pity, too, for Theobald's damaged fame seems a little overwrought in view of the fact that Theobald's care for posterity has ceased long since—in short he has been at some pains to invest his narrative with an atmosphere of romance which contrasts rather incongruously at times with the subject matter and purport. But at all events the story, tho rather diffuse, is on the whole highly entertaining. It is not only a revelation; it has the farther interest of intrigue and no doubt to some extent that of scandal, tho it is only literary scandal and by this time quite innocuous.

Historic Towns of the Connecticut River Valley. By George S. Roberts. Illustrated. Kobson & Adee, Schenectady, N. Y. $4.50.

The Ohio River: A Course of Empire. Illustrated. By Archer Butler Hulbert. New York: G. P. Putnam's Sons. $3.50.

These two books are the offspring of the growing interest in all details of United States history, but it is difficult to see any excuse for such an unrelated mass of odds and ends as has been put within the covers of Mr. Roberts's volume. That some portions are more carefully done than others is true. The towns are treated in geographical order, beginning at the mouth of the river, with, consequently, neither historical nor chronological sequence, and the only connecting link, the region itself, has scant notice in the introductory chapter on the Indians and the geologic formations. Mr. Roberts has note as a compiler of local history, and in the Connecticut Valley, happily known to the Indians as the "Smile of God," he has a subject rich in history and legend. He writes pleasantly, but he has not written a chronicle, for he has written loosely. It is as tho a clever reporter had run up the river in a launch, gossipped at town after town with the oldest inhabitants, taken snapshots of ancient houses and sites of mills and forts and afterward steamed thru county histories, those fearful compilations, had then shaken together his gatherings and measured them off in pages. It is readable, for he is a clever reporter, but he is unreliable—perhaps he did not aim to be so; names are spelled wrongly, dates are awry, and now and again some statement amazes those familiar with the old towns. There is a newspaper flippancy too that should lie outside the work, of flippancy quite unlike humor. All this is too bad, for now Professor Hulbert probably will not write on Connecticut Valley as in the volume before us he has written on the Ohio, for Professor Hulbert's volume, one of the series of local histories from the Knickerbocker Press, is of another order, tho it, too, is published in the size sacred to the parlor center table, and peculiarly inappropriate to history. The Ohio has played a part in the drama of American history. Missionaries, explorers and pioneers followed its course. The French and Indian War touched it; blockhouses and forts were built along its margin; it saw the Revolution, and later was the threat to make it a boundary between two nations, one slave, one free, tho our author does not reach that point in history. Meanwhile the accounts of the towns along its course are for the most part smoothly treated in the general narrative. Professor Hulbert too often acts on the notion that such expressions as "make a mess of it" and "'a hold-up' proposition" add to sprightliness. Fewer extracts and a more concise treatment would make for vividness, but the book, with its excellent illustrations, shows careful research and gives a thoro knowledge of the region with which it deals.

The Master Man. New York: John Lane & Co. $1.50.

This is a story that will interest some people and disgust others. The climax of dramatic interest is reached when a mob attempts to lynch a negro who has committed the nameless crime. Doubtless it is anonymous for this reason. But any reader will discover the spirit

marks of femininity in every sentence. More women than men get mobs into their stories. But here is the difference. In a man's story the mob usually controls the situation. In a woman's it never does. It is a zephyr which they blow up as they list. Nothing ever was so perfectly controlled or so completely outwitted as a mob when it makes a mistake and gets into a woman's novel. And there are other infallible signs of female authorship in these pages. For example, women never are to men what they are to one another, and in this book that is their limitation. They are not mates for men. Even Marguerite is a little rose-bush heroine, born to blush and to be seen, of course, but eventually she is only worn like a bridal wreath by the hero at the marriage altar. No man could really marry a thing like that. And men are never what women think they are, which is another proof that this book is written by a woman. The leading male characters are too much the lofty "lion-headed" products of the admiring female imagination. Doctor McIntyre is too brave, too successful a physician, too willing to throw his life like a snowball into every emergency. Amos Neal is more of a man than any man can ever be, and the closing scene represents Dan Haskell, the hero, as dismissing a crowd of mourners who had been in the mob the night before, "with a gesture of his hand." Such majesty is overdone. It doesn't happen away from a woman's guiding penstaff. However, for that class of readers who adore lion-headed doctors, and the excitement of facing mobs on paper, this may be an interesting story.

The Upper Hand. By Emerson Gifford Taylor. New York: A. S. Barnes & Co. $1.50.

A benevolent pirate who coerces his bitterest enemy into bringing up the daughter of a man he had wronged, is an unusual figure in a quiet New England town. So is a labor leader, who is also a fanatical revivalist full of the crudest kind of religious and social theories and as crassly ignorant and disreputable as a man could well be; but the author of *The Upper Hand* seems to think nothing of peopling his pages with these and similar types, nor does their manifest unreality disturb him at all, secure in his presentment of a leading lady of such peerless beauty and charm as neither New England nor any other locality ever saw outside a melodrama. The Paragon heroine has not flourished in recent fiction, which prefers personified problems or paradoxes instead, and the older fashioned lady, who is so beautiful, so good and so satisfying a model for young girls, comes to us with the freshness of a dramatic star after a long rest in the country, full of captivating and disingenuous wiles, but with a sweet-brier freshness of fields and fragrant old gardens lingering about her. The mystery of the story is nowhere lucidly explained in terms understandable to people who like their plots printed in large type, and the construction of the book is somewhat loose and episodic. It is not local in flavor, but might have happened in New Zealand quite as naturally as in New England, where the scene is laid.

Letters to Women in Love. By Mrs. John van Vorst. New York: D. Appleton & Co. $1.50.

Mrs. John van Vorst has swept aside the so-called problems of the day so far as women are concerned, and come down to the fireside particulars which are responsible for the problems. And if we are to believe Mrs. Van Vorst the trouble is not what those social economists think who have so much to say about ameliorating the conditions of feminine existence. Her point of view is at the same time far from sensational. She thinks that "the thing which counts about a woman more than almost anything else, from beginning to end, is her age. She spends half of her life 'not being old enough and the rest in being 'too old.'" And she tempers her advice accordingly. For example, if a woman is over thirty-eight she must have patience in dealing with the man she loves; if she is less than twenty-five she may risk defiance in order to bring him to terms. She is startlingly shrewd in dealing with wives who have reached the "center of indifference" in the married life, and her instructions should be equally helpful to another class who become so easily "incompatible" or disap-

pointed in their husbands and hysterically contemplate divorce as a release. Few women will like the book, it is so pertinent, but most of them over thirty years of age could profit by Mrs. Van Vorst's suggestions without injuring society, which is more than can be said of much advice given women these days.

Literary Notes

....*Who's Who* for 1907, the original English book of that name, containing both British and American men of prominence, is issued by Macmillans. ($2.50.)

....Dean Hodges' pleasant genius for saying important things that are perfectly clear when once he has said them for you is manifested in his cheering essay on *The Pursuit of Happiness,* issued by Doubleday, Page & Co. (75 cents.)

....A reverent study of Christ, *The Master of the World,* by Charles Lewis Slattery, Dean of the Cathedral in Faribault, is published by Longmans, Green & Co. ($1.50). The author endeavors to unite the dogmatic definitions of Christ, the devotional aspirations to him, and the gospel records as interpreted by critical scholarship, which is too large an undertaking to allow of much success.

....The only translation of Heine's works that approached completeness has been that made by the late Charles Godfrey Leland ("Hans Breitmann"), and this has now been republished, with the addition of four volumes of other translations, by E. P. Dutton & Co. This edition includes both the prose and poetry of Heine, nearly complete except for those passages which the translator thought it necessary to expurgate. (12 vols., $25.00.)

....In order to secure a wider audience for his theories on how the happiness of the human race may be increased and extended, Mr. James Mackaye has published in cheap unbound form the third book of his large work on "The Economy of Happiness," which we reviewed at length and favorably in our issue of October 4th. The reissue is called *The Politics of Utility,* and in it the author describes his model social system, "Pantocracy." (Little, Brown & Co., Boston.)

....*Book by Book,* by Prof. James Robertson, Prof. A. B. Davidson, *et al.*, contains a brief introduction to each book of both Testaments. Questions of date and authorship, structure, literary quality, and religious teaching are considered. The names of scholars of note appear on the title page, but the studies were written several years ago for a London publication and they are not now reliable as to scholarly opinion on the subjects of which they treat. (Philadelphia: J. B. Lippincott Co. $1.25.)

Pebbles

"How did the bookkeeper manage to break into the safe?"

"He was so used to making entries."—*Harvard Lampoon.*

Solemn Senior—So your efforts to get on the team were fruitless, were they?

Foolish Freshman—Oh, no! Not at all. They gave me a lemon.—*Harvard Lampoon.*

Quoth dad, "Your lips look red tonight."
Said she, "Well, yes, perhaps,
But papa darling, that's all right,
It's only from the chaps."
—*Pittsburg High School Journal.*

Student—There must be some mistake in my examination marking. I don't think I deserve an absolute zero.

Inspector—Neither do I, but it is the lowest mark I am allowed to give.—*The Intercollegian.*

The Congressman
Sat in a train
And murmured in
A tone of pain:
"Of all sad words
In times like these,
The very worst
Are 'Tickets, please!'"
—*Washington Star.*

Mary had a little lamb,
It's fleece was gone in spots,
For Mary fired her father's gun,
And lamby caught the shots!
—*Columbia Jester.*

He kissed her on the cheek,
It seemed a harmless frolic;
He's been laid up a week
They say, with painter's colic.
—*The Christian Register.*

Distracted Mother (at her daughter's wedding)—Oh! oh! oh! What shall we do? The groom hasn't come, the guests are beginning to giggle and my daughter is in a faint.

Friend of the Family—Calm yourself, madam. I saw the groom, only two hours ago, entering the Great Dry Goods Emporium at the corner. He said he had forgotten to get gloves.

(Suddenly breaking into smiles)—"Oh, then, it's all right. He's probably waiting for his change."—*New York Weekly.*

ONE MORE GEM.

There's one more gem in the Master's crown,
One more to sing of his love,
When he bid his great Angel stoop down;
And pluck a flower for the garden above.

No one to love or own you,
Like a flower that blooms in the night;
Only to close in the morning,
Too tender to bear the light.

I guess they didn't want you,
You frail little flower,
But they wanted you in heaven,
Where the Angels are.
—*M. D. F., in Endeavor (Wis.) Epitome.*

Editorials

Theodore Roosevelt's Great Opportunity

THE article in this issue by Hayne Davis, dealing with the President's past services in promoting the peace of the world, contains a suggestion in regard to services which could be performed in the near future. Present conditions call for careful consideration of this suggestion, namely, that the President of the United States is now in a position to cause the establishment of a Permanent International Conference or Congress at The Hague.

In our February 22d issue of last year we commented favorably upon Baron d'Estournelles' proposition for the creation of an International Council, as soon as France and the United States could be induced to appoint and pay permanent members of such a body; and we suggested then that the proper place for ex-Presidents, not only of the United States but of all republics, is in a properly constituted International Congress, which shall concern itself exclusively with questions of common concern to all nations. Events since then have been hastening the world to the inevitable day of establishing such a Congress, and there seems to be no good reason why it should not issue from the approaching Conference at The Hague.

This idea is several centuries old, having come into political literature thru its consideration by Henry the Great of France, and its development in the "Memoirs" of his Prime Minister, the Duke of Sully.

In the 30's it was suggested, vaguely, it is true, by resolutions introduced into a number of American State Legislatures, and approved by one or both Houses in several States, notable among them being Massachusetts, from the fact that in 1903 both Houses of the Massachusetts Legislature passed unanimously a resolution which distinctly and definitely called upon the United States to move in the matter of creating a permanent International Congress, with at least advisory powers. Since then it has been endorsed by the Mohonk Conference on International Arbitration, composed of eminent jurists, educators, editors, business and professional men.

It is specified in the resolution of the Interparliamentary Union, past at St. Louis in 1904, as one of the ideas that ought to be considered by the International Conference called for by that resolution, and which is soon to convene.

The press of America was very hospitable to this idea in 1904, and has become still more so since the action of the Interparliamentary Conference, at London, in July of last year, calling for its presentation to the next Hague Conference.

This idea has found able and outspoken advocates, therefore, among all classes of society, in Europe and America, save one —the chief executives of the nations. It cannot become effectual until this class accepts it and declares for it.

Every one admits that neither peace nor justice has any possible chance of being securely and permanently established until such a congress is not only created but endowed with suitable authority for declaring the principles of law which ought to control the action of nations in their intercourse with each other. How can there be observance of law till law is established? How can law be established among nations except by an International House of Representatives?

Eminent men in every nation are waiting for some executive to declare for this Interparliamentary plan. The most eminent men of France have practically invited Mr. Roosevelt to be the man by sending him recently a copy of the "Memoirs" of the Duke of Sully, in which this idea was first and fully developed.

The President has himself declared in his message to Congress that some sort of international organization for administering justice among nations is necessary and timely.

State legislatures are now passing resolutions which call for the earliest possible creation of political machinery to administer justice among nations, as it is now administered among several. Im-

portant political changes, which have recently taken place in Europe, indicate that the hour has struck for effective action in this matter; for instance, the election of Fallieres to the Presidency of France, the elevation of Campbell-Bannerman as the Premier in England. Leaders of all political parties will rush to the support of the executive of any important country who espouses this plan of the Interparliamentary Union. Everything conspires to invite the President to declare for that form of International organization, outlined by the recent Interparliamentary Conference, which contemplates:

(1) A permanent International Congress, to convene periodically and automatically, for discussion of those international questions which the current of events makes paramount.

(2) Jurisdiction for the Hague Court in a clearly defined area of international rights.

(3) Mediation, or an investigation of disputed facts, prior to the commencement of hostilities, in all those controversies that are reserved for trial by force of arms, instead of by judicial decision.

All the great work that the President has thus far done to promote peace will pale before the great light of being first among chief executives to come out boldly for these things which pertain so vitally to the peace of the whole world. Indeed, the President now has an opportunity that was never open to any chief executive in any age. He can carry this great plan to a successful issue, and perhaps without opposition, at a time when he is using his force to press for reforms of a purely local character and much less important, and is making headway against considerable opposition.

Not that he should leave these local matters undone, but that he can take refuge from the resistance occasioned by doing them, in the larger and grander work in which men of all parties will aid him.

Of course nothing impractical can be accomplished, but nothing possible should be left unattempted.

The Hague Court issued from the first Hague Conference. Shall nothing come from the second Hague Conference greater than a definition of what constitutes contraband of war or a resolution concerning the rights of neutrals? The next few months are critical. No man as yet understands the present situation who does not clearly see that international peace must come not before, but after, the earth is politically federated and organized and as a direct and inevitable result of such federation and organization. All talk of permanent peace or reduction of armaments till then is premature. The next step, therefore, is for every friend of progress to do what he can in the next few months to make the forthcoming Hague Conference declare for an international parliament to supplement the international court the last conference gave us. All other questions before the conference are side issues. If any one man in the whole world today can bring about this poet's dream of the "Parliament of man, the Federation of the world," it is Theodore Roosevelt. He is not a man to stagger at the magnitude of an undertaking, nor to fear the obstacles that stand in the way. Opportunity for service is what he desires, and certainly here is an unparalleled opportunity to do peaceably and on a world-wide scale what Washington accomplished only after a war on a continental scale.

The Heretic's Dilemma

An interesting and radical article in this issue, which we could not well refuse to publish, and to which we have invited replies, raises a question of no little importance as to the right of those to remain in a Church who believe themselves to be in essential agreement with its faith and purpose, but who know that they are not in agreement with its articles of faith as usually understood and interpreted. Our writer appears to be a somewhat extreme illustration of this condition of mind. He belongs to a Church which has an old formulated creed. He acknowledges that some of its important articles he does not believe. He does not believe in what is usually meant by the inspiration of the Bible. He believes that in the New Testament, as well as the Old,

the mythical element is prevalent and accounts for the stories in two Gospels of our Lord's birth and in the four Gospels and in St. Paul's Epistles of his resurrection. Whatever the disciples and the women saw, or thought they saw, or are said to have seen, he explains as mental vision or imagination or legend. And yet he says that these elements in the Bible account and these articles in the creeds are not essential, are merely questions of history and are not spiritual facts, and that the ethical and religious teachings of Christ and his Apostles are all that is of essential value. He loves the Church of his birth and his training. He thinks he can do most good by remaining in it. He holds these opinions, not for disputation, but for private consumption. He does not preach them; he does not tell them to the general public; he is too much engaged in the work of his ministry to endanger it by stirring up hostile charges of heresy. He hardly defends his silence, but merely declares his policy of silence until the change of public opinion and tolerance achieved by the agency of more belligerent doubters shall make it safe for him to publish what he believes. Of course he believes that his reticence is right—for him.

It is not for us to judge and condemn him; to his own Master he stands or falls. That Master is his own conscience, his God, and, perhaps, his ecclesiastical court, if he is ferreted out. But he challenges, or seeks, or desires no ecclesiastical martyrdom. He does not envy Dr. Crapsey's fate.

His case is a more than usually typical one, because it covers pretty much the whole gamut of dogma. It raises the whole question whether one who seems to deny the resurrection of our Lord—and with it goes, or may seem to go, the entire miraculous element in Christianity, and what was to Paul the chief proof of the immortality of the soul and the future life—has any place with organized Christianity, and whether all that is important in Christianity is the ethical, the spiritual, the fellowship and service of God, which Jesus taught and which the Church has tried to develop in all its members, and as to which Christ is recognized as the great religious prophet and teacher of the world. By this anonymous confession the question is brought directly before the Church, apart from all disturbing personal considerations.

We have said, and we repeat, that to his own master, to his own conscience, and, later, to his own ecclesiastical authorities, each man must stand or fall. It may be hard for others to agree that the accepted history of the origin of Christianity and of the life and resurrection of Christ is not essential to Christianity. Those who take this usually accepted view, expressed as it is in ancient and modern creeds, must exclude such a one from their fellowship. That is their right and their personal duty. But such is not his view. He believes that such history is unhistoric, therefore unimportant, and that the vastly superior elements in Christianity are those in which he agrees with the teachings of Christ and his Apostles as to the privilege and duty of the sonship of man toward his loving Father in Heaven. With such a conviction he cannot withdraw. He will go peaceably if required, but he will try as long as he can to teach and preach this love of God and this discipleship of Jesus Christ. But we cannot put blame on those who discover his failure to accept very important articles in the creeds, and who tell him, and with authority, that his place is not with those who believe. They may properly bring and press the charge of heresy, which he would as properly try to avoid.

Governor Hughes's Message

When Gov. Hughes was inaugurated at Albany, it was noticed that nearly all of the old bosses or so-called leaders of his party were absent. He had not asked any of them for advice as to his policy or the recommendations of his message. Having some knowledge of his character, they could not reasonably expect to find those recommendations acceptable to themselves and to men of their kind. Therefore they wisely had engagements elsewhere. They were right in thinking that Albany was no place for them on that day.

It is a good and strong message—this first one from the new Governor of New York. It is directly aimed at the evils of the time. There is no waste of words, but plenty of clear, straightforward reasoning and assertion.

Mr. Hearst, the Governor's defeated opponent at the recent election, gained a part of his support by reason of the belief of many that he had been robbed of the office of Mayor of New York in 1905. There should have been a recount of the votes. He could not get it from the courts or the Legislature, and the Republican Attorney-General declined to test by legal proceedings the present Mayor's title to the office. Governor Hughes now recommends that provision for a recount be made immediately by the Legislature, that the courts be empowered to order recounts after future elections, and that power to authorize suits for testing title to office be transferred to the courts from the Attorney-General. He is right. All this should be done. There is ample warrant for it in the events of the last twelve months.

If this be favorable to Mr. Hearst, the following recommendations for laws limiting the amount of money which a candidate may spend to procure his election, and empowering the courts to review the fraudulent or corrupt exclusion of delegates from political conventions, are not necessarily to be classed with it. For it was Mr. Hearst who reported an expenditure of $256,000 in the recent campaign, and it was by the exclusion of about sixty delegates at the Buffalo convention as a result of his alliance with Mr. Murphy and Mr. Conners that the nomination of Mr. Hearst by that convention was assured. But it would be unjust to ascribe to the Governor a personal motive for any of these recommendations. They are clearly of a non-partisan character and in the public interest. In that interest the entire message was written.

We have said that it is aimed at the evils of the time. This appears most distinctly in those parts of it which call for the abolition of the State Railroad Commission, the State Commission on Gas and Electric Lighting, and the Rapid Transit Commission of the City of New York. The reasons given by the Governor are sufficient in themselves, but there are others of much weight that would have been out of place in an inaugural message. Having pointed out that Federal legislation to prevent rebating and other kinds of discrimination designed to promote monopoly should be supplemented by State laws for traffic wholly within the State's boundaries, he says that the present Railroad Commission has no power to compel obedience to its orders, that for disobedience there is no penalty, and that the commissioners' salaries, which should be drawn from the general revenue, are paid by the railroads. Some corporations are subject to the jurisdiction of both the Railroad and the Gas commissions. He would substitute for both one new commission, with all the powers (he enumerates them) necessary for safeguarding the public interests.

What he says about the Railroad Commission is true enough, but it is also true that the Commission has not properly used such power as it has, and that it has been a refuge for discredited politicians and party hacks, and a stronghold of political jobbery. In asking for the abolition of it, the Governor strikes directly at political bossism in his State, and strikes with the courage that an ideal Governor should have. It is necessary not only to have new and better railroad laws, but also and especially to have a new Railroad Commission. We hope he will get one. But it will not be given to him merely for the asking. The Gas Commission is young, and has a better record, but one Commission of the right sort could do the work of both.

He would abolish the Rapid Transit Commission (substituting for it a new one with greater powers) mainly because it divides with the Railroad Commission supervision over the several municipal railways, all of which are controlled by one corporation. The proposed new Commission would also supervise and regulate the gas and electric lighting of the city. Undoubtedly, as he says, more strict supervision is needed to secure better service on the city's existing railway lines:

"Overcapitalization and the improvident creation of guaranties and fixed charges to suit

the exigencies of successive combinations entered into for the purpose of monopolizing the traffic have produced their natural results. There are such unjust burdens upon earnings, and the tendency constantly to effect economies at the expense of proper service is so strong, that it is imperative that the people shall have vigilant representatives clothed with ample authority to compel the corporations to perform their public duty."

The Rapid Transit Commission does not deserve to be classed with the Railroad Commission, but it no longer enjoys a sufficient measure of public confidence. A majority of the people are not convinced that it uniformly places their interests above those of the great railway corporations. Such a Commission as Governor Hughes would appoint, possessing the powers which he suggests, is to be preferred, altho in the creation of it there should be due regard for home rule.

Probably the Governor realizes that in these recommendations for the adequate supervision of public service corporations by new Commissions he is exciting the opposition of very powerful corporate interests which are not without political influence. At the very beginning of his term he has a fight on his hands. The people, for whose welfare he contends, should help him in every possible and legitimate way. Among the rewards of success must be counted one which we think he does not seek—deserved prominence in the field of national politics.

Scientific Versus Classical Education

THE central theme of the New York meeting of the American Association for the Advancement of Science—if so complex a body can be said to have a single theme—was the question of the relative values of scientific and classical training. President Butler, of Columbia University, deserves praise for having violated the tradition that an address of welcome shall contain nothing but platitudes and compliments. It was certainly not a platitude and it could not be construed as a compliment to the scientifically trained men he was addressing, to say that science had failed to fulfill its promise of twenty-five years ago that it was equal or superior in educational value to the old humanities.

"I should respectfully submit that this development has cost us something and gained us not much. But we are still in a period of transition, and I simply throw out to you this word in discussion of the effectiveness of this field of general interest, for I cannot help feeling that the sciences are properly to be classified as the humanities, and to take the place, perhaps, in education, of old humanities, and with the same power to reform and uplift. And, so far, I feel we have come for short of organizing them properly to obtain this end. The next decade may see this desired result obtained. In the next generation the sciences may contribute to a more uplifting and humanizing influence, organized and perfected for educational work of the highest sort."

In his reply to the address of welcome Dr. W. H. Welch, of Johns Hopkins, president of the Association, and one of the foremost medical men of America, met this "impeachment of science as an educational instrument" in a frank and tactful manner by suggesting that the aim of science was not to provide a more or less satisfactory substitute for the classical methods in producing the same result, but that the old ideal of the humanistic education was not the right one, and that the scientific form of education would supply its lacking elements.

This thought, that science brings into education not merely a different method, but a different ideal, was the keynote of the address of the retiring president, Prof. Calvin M. Woodward, of Washington University, St. Louis. He stated in bold contrast the two opposing ideals, conflicting aims, and told of the harm that had been done to the world by the adoption of the classical ideal and its extension to other peoples and social conditions, in particular its injurious influence at the present day in cultivating a spirit of caste, a contempt for the useful arts, a taste for semi-gladiatorial athletics, and a tendency toward regarding a life of refined selfishness as the purpose of culture.

"The Greek idea of education and culture was based upon the existence of a privileged class, fed, clothed and sheltered by the labor of slaves—a real aristocracy devoted to war, art, literature and luxurious living.

"The education we must study is the universal education of the American people. We have put science, and ever more science, into the world's work; we must now give science and culture and skill to the world's workers."

In support of his theory that the classical ideal of education was antagonistic to the progress of civilization he quoted both ancient and modern humanists:

"Philosophy, according to Seneca, 'had nothing to do with teaching men how to rear arched roofs over their heads; and they were not concerned with the various uses of metals. She teaches us to be independent of all material substances, of all mechanical contrivances.' The wise man, said the Roman philosopher, lives according to nature. Instead of attempting to add to the physical comfort of his species, he regretted that his lot was not cast in that golden age when the human race had no protection against the cold but the skins of wild beasts, no screen from the sun but a cave in the earth. To impute to a philosopher any share in the invention or improvement of a plow, a ship or a mill was an insult. The invention of such things, wrote Seneca, is drudgery for the lowest slaves. Philosophy lies deeper. It is not her office to teach men how to use their hands. The object of her lessons is to form and nourish the soul.

"As for Seneca, he sang the praises of virtue and literary culture, and then closed his career by an exhibition of meanness, ingratitude and corruption which threw a blanket of infamy over his fine advocacy of a philosophy which was to form and nourish the soul."

Scientific men take the view that studies so far as possible should be both interesting and useful to the student, but the ideal of the classicists is quite the opposite. Even mathematics, one of the pillars of the old-fashioned education, has now gone over to the enemy, since it has been found to have practical value even in its abstract branches. The classicists will have to take refuge in the fourth dimension since they are being crowded out of the other three. President Patton, of Princeton, a few years ago expressed his regret that the higher mathematics had been found useful in the study of electrical appliances, for, said he, "as the utility of the subject increases its educational value decreases." Professor Wendell, of Harvard, holds that "the very fact that the abstractions of mathematics must generally seem repellently lifeless, is part of the secret of their educational value."

In many of the sectional meetings of the Association speakers took up the glove which President Butler threw down at the opening session. The tone of the discussion showed that science was no longer pleading for a humble share in an education essentially along the old lines, but is prepared to substitute very different ideals from those to which teachers have for centuries been devoted. Actions speak louder than words and nothing shows this more clearly than the recent action of the alumni of the Boston School of Technology in successfully opposing the alliance of that institution with Harvard University, because, as some of them frankly said, they believed the classical, aristocratic and athletic influences of Harvard would taint the atmosphere of the school and impair the character, scholarship and efficiency of its students.

The Agricultural Basis

ONE of the most striking facts brought out in the various annual reviews of the business world which have received passing attention within the week is the tremendous growth of agricultural operations now in progress in the United States. "The passing of the American farmer" was almost a wail of lamentation half a dozen years ago. Present indications are that the American farmer will not abdicate his functions as the substantial creator of American wealth and American institutions for some years to come.

The total value of last year's harvested crops is estimated at $6,800,000,000, an increase of half a billion dollars over the product of the year preceding, which then surpassed all records. This estimate, we are told by Mr. George K. Holmes, of the Department of Agriculture, is undoubtedly below the real figure. So also, probably, is the Department's estimate of the value of American farming capital. The census of 1900 put this farm property, including land, improvements, buildings, implements and live stock, at $20,000,000,000. The present value, according to the Department, is not less than $28,000,000,000 —a respectable increment for seven years. Of this total, $23,000,000,000 is credited to the value of agricultural real estate.

If the farming land of America had turned out to be in fact substantially that area of tillable surface which seven years ago would have been so inventoried, our satisfaction in this exhibit of agricultural

wealth would have been subject to serious qualification. We should have been obliged to say that these years of great general prosperity had raised farm values to practically their final level for perhaps generations to come, and that we must now face the certainty that agricultural interests must play a relatively smaller and smaller part in the further development of this country.

The unexpected that now and then happens has been this time one of the most genuinely unlooked for things in the history of man's economic life. Between the rich, wheat-bearing prairies of the Mississippi Valley and the Rocky Mountain ranges lay the semi-arid lands. When the first Pacific Railroad was built these lands were called desert. It was supposed that they were as nearly worthless as any area of dry land could be. When their value for grazing was demonstrated, it was wonder enough, and to grazing they were consigned for all coming time. Then the possibility of irrigation was dreamed of, but rather as a bonanza of the imagination than as a great practical undertaking. Now all at once, comes the really amazing certainty that these lands, without any irrigation whatever, are among the most productive wheat fields in the world, and from every quarter a land-hungry horde is moving in upon them. Twenty-five years from now the dreary plains of alkali and sage will be green with all manner of luxuriant crops, and a farming population numbered by at least tens of millions will have planted them with villages equipped with all the comforts of a civilized existence.

This tremendous prospect we owe to the discovery of "dry farming," which is simply the application of a few elementary scientific principles to the preparation and treatment of the soil, whereby every bit of moisture that falls is stored up in the ground itself and made to serve the needs of the growing crops. Some marvelous achievements have been reported within a year. In the Eastern sandy section of Colorado, without any irrigation, 28 and 30 bushels of wheat to the acre are obtained, not as exceptional yields, but as regular business returns.

That thousands of rash and incompetent men, lacking both the knowledge and the patience to succeed by scientific methods, will take up arid lands, only to fail, is probable; but very surely, if slowly, natural selection will sift the boomers, and the surviving population will be one of the most intelligent and resourceful sections of the American people. So, also, will be the population of the more than 5,500,000 acres now being reclaimed by irrigation.

What a splendid recruiting this will be of the elements that can be depended on to support the best traditions and to push the most hopeful reforms of American political life! These millions of farmers will be no helpless creatures of corporation rule; they will not tamely submit to the building up of a great plutocracy on the ruins of republican institutions. The agricultural basis of our American political experiment is still sound, and instead of narrowing, as we had too precipitately feared it must, it is to be wider and firmer than ever before.

Those Negro Soldiers

THE negro regiments have had a fine record up to the Brownsville affair. Negro soldiers did brave work in the Civil War. They have done well in Cuba and the Philippines. Their white officers have fully approved their discipline and their courage. But that most unfortunate and criminal Brownsville shooting, which seems thus far to be proved, has most unfortunately dimmed their fame and grieved their friends, whatever may have been its provocation, and it is now reported that all the negro soldiers are to be sent to the Philippines.

This raises the question, very distinctly formulated by Captain Steele, whether it is a right policy to have separate negro regiments at all. They were organized in the interests of the rights of the negro to equal part in the public service of war as well as peace. The negroes have accepted the policy and taken pride in it, just as they do in their separate colored churches. They have not seen in it any Jim Crow policy of the Government, and yet the segregation of negroes in army or church or school is a real discrimination on account of color and race, and therefore a recognition of inequality.

Yet, on the other hand, it is such a recognition as prevails, more or less, all over the country, and is accepted, in part, on all sides. We do not defend it in the least, but for the comfort of those concerned it seems best that, for the present, colored churches should exist. This is the defense of the colored regiment.

And yet it were well if there were no colored regiments and if colored men were equally admitted as soldiers in all our regiments. We do not believe that they would usually be treated unfairly. Fellowship of experience and work and danger makes fellowship of heart. There was no such trouble about their fellowship in our Revolutionary War, when white and black were mixt indiscriminately in the ranks, and when, as a German officer remarked in his diary, lately published, about half of the soldiers from Rhode Island were negroes, and doubtless they were admitted in all the regiments. What was done then could be done now. The army should know of no caste.

The Jamestown Exposition Program

It is amazing that the managers of the coming Jamestown Exposition should have so utterly misconceived the purpose of such an exposition. The object of every great exposition thus far has been to develop the industries of peace; this one they undertake to make a display of the art of war. This is the tercentenary of the settlement of Jamestown, in 1608. It should be historical and should show the development of a great nation, whose achievements are chiefly those of peace. We have had wars, to be sure, and we have a little army and a larger navy; but our wars are occasional and our army is incidental, as also is our navy. Our grand growth has been in education, manufactures and trade, in arts and sciences. These are what the Jamestown Exposition should record and exalt.

But the managers think otherwise. They thus open their program:

"Jamestown Ter-Centennial Exposition. Character: Military, naval, marine and historic exhibition."

So it is to be first "military and naval" and only last "historic." This is a shocking inversion of not only what is right, but of what was first planned and proposed when Congress was wheedled into giving a very large appropriation. Of the thirty-eight "attractions" announced in the official organ of the exposition, eighteen are military and naval. It is to be "the greatest military spectacle the world has ever seen"; "magnificent pyrotechnic reproduction of war scenes"; "greatest gathering of warships in the history of the world"; "the greatest military and naval parade ever witnessed"; "a great living picture of war, with all of its enticing splendors"; and even we have—what should never have been reproduced—"Reproduction of the famous battle between the 'Monitor' and the 'Merrimac,' at the place where that battle was fought."

Is it conceivable that Congress gave $1,700,000 for this purpose? Did Congress understand that this exposition was intended to magnify war instead of peace? Would the people's money have been appropriated if Congress had had in view this announcement of the official journal:

"The Exposition will be primarily a military and naval celebration, commercialism being relegated to the rear; but certain industrial features will play an important part in showing the progress of art, science, and the great inventions and improved methods of the present."

Congress at first appropriated $200,000 for the exposition. The managers sought a very large additional appropriation, but were opposed by Speaker Cannon, and it was tacked on as an amendment to the Sundry Civil Bill in the Senate by the effort of the Virginia Senators, and then, by much lobbying, was put thru the Lower House. But it was months after the appropriation that we were informed that this exposition was to reverse the history of previous expositions, and was to be devoted to the art of destroying what their object was to build up.

We do not object to an appropriate display by our Government of the work of its departments of war and navy, such as was had at St. Louis, and equally we believe in a reasonable army and navy. But all that was and is secondary. Here we are told that what was secondary there is to be primary now. Commer-

cialism is to be relegated to the rear. Foreign troops are to be on exhibition; there is to be "a continuous and varying scene of martial splendor from beginning to end," with pictures of "sham battles" and "battleships endeavoring to force a landing"; "the most colossal aggregation of fighting strength that has ever been gathered in one spot," "with the single purpose of destruction." And this is the enticing and detestable show to which our citizens and our youth are invited. We do not like to say that Congress was buncoed, but we cannot believe that, with such a program in advance, the appropriation could have been made. This is the age of the The Hague conferences and of arbitration; the Jamestown Exposition is harking back to the spirit of bygone savagery.

The Reform Wave in Buffalo

PROBABLY no police force in the entire country has shown such marked improvement during the year 1906 as that of Buffalo, N. Y. When its new chief executive, Mayor Adam, took office on January 1st, he was confronted with the deplorable police conditions. During the campaign preceding the election the press of all parties frankly conceded that intolerable conditions had grown up under the old *régime:* gambling, vicious dives, disorderly resorts and wide-open sections of the city had been flourishing until there was need for drastic action.

Immediately upon taking office the Mayor began investigation of the police department, which revealed the sudden payment of $13,000 of deferred funds long since due. The superintendent resigned. The Mayor protested against the acceptance of his resignation, but was overruled by the two other police commissioners, who were a legacy from the preceding administration. The term of one of these commissioners expired by limitation. The Mayor appointed as his successor the vice-president of one of the largest banks in the city and the head of one of the largest tanning and leather industries in the country. Straightway the reorganization of the police department began. A new superintendent was appointed. Over ninety dives and dens of iniquity were closed outright and policemen stationed in front of the doors. The Mayor summoned the brewers and informed them that such places must not be reopened and would not be tolerated. The brewers promised co-operation. Entire city blocks were cleansed of such resorts. Gambling was suppressed. Disorderly places were wiped out. Conditions were completely changed from the worst to the better.

The new superintendent has won high praise. He began as a patrolman and thru sheer merit and ability has worked his way to the top. He knows the police business from the ground up, and the disorganized force became under him a reorganized force, cheerful, willing and obedient.

The merit system prevails in the department, and all appointees for patrolmen, sergeant, captain and inspector are taken from the civil service list. There is no State control. There is no countenancing of crime or criminals. There is no social evil crusade, but there has been effective measures to root out vile dens and to see that there is no flaunting of vice upon the people.

Mayor Adam, in the performance of his duties as chief executive of the city, preferred charges against the holdover commissioner. Under the law the Mayor himself has no power of removal of the commissioners, this being vested in the Appellate Division of the Supreme Court. The Court appointed a referee, who heard the charges, and reported it to the Court that the commissioner should be removed. The Court, to the surprise of the community, received the report of the referee and then failed to order the removal of the official.

Mrs. Eddy

McClure's Magazine having issued the first part of its series of the exposure of Mrs. Eddy's career and teachings, Mrs. Eddy has made no delay in categorically denying nearly the whole of the damaging assertions about her and her family made in the first article. She seems to understand that this attack on her record will be most damaging if not met, and that it must be met in the most positive

way, by absolute contradiction. An example of her denials is this:

"Regarding the allegation by *McClure's Magazine* that all the family, 'excepting Albert, died of cancer,' I will say that there was never a death in my father's family reported by physician or post mortem examination as caused by cancer."

Similarly she treats every other disparaging story. Now all these things are matters of history. They are in the knowledge of people now living. The *McClure* article claims to give facts gathered on the spot from those that have knowledge. Mrs. Eddy also has knowledge, and she is deeply concerned. While her philosophy and her religion are matters of no little importance, and appeal to many people more than they do to our judgment, the details as to her three husbands, or the questions whether she was hysterical as a child and whether as a grown woman in her illness she was rocked and swung, are personal matters which do not concern us, nor do we care whether she has one or a dozen genuine coats of arms. Let those fight the matter out who are interested in them. Mrs. Eddy's quick reply to the first of the articles will seem to necessitate her reply to the others as they appear, which may be more necessary than dignified.

Delays of Criminal Justice

What the distinguished judge Emory Speer, of Georgia, says of the subversion of justice under our present legislation has been said by other distinguished justices even of the United States Supreme Court, but never better said:

"Today it is almost impossible for a judge in our State, who feels his nature outraged by crime even the most heinous, so to conduct a trial as to avoid what has been denounced as 'error,' in the construction of certain baleful statutes, which ought to be swept from the pages of our legislation. When strong men are weeping in the presence of crime, which has brought desolation on a happy family, by a technical objection to an indictment a single judge may exonerate the criminal, and the people have no appeal. . . . .

"A skilful or crafty attorney, tho guilt is plain, tho sentence has been pronounced, tho the Supreme Appellate Court may have affirmed it—may by repeated motions on the same point, which has already been decided, renew his motions and renew his appeals, and thresh over the old straws, altho the highest court in the land again and again may have decided against him, until a horrified people stand aghast that laws, made for the administration of justice, are utilized for its shameless obstruction."

And it is such laws, and such legal practices, that is the excuse for popular violence.

The Hittites and the Jebusites

Professor Sayce first took up in 1873 and 1874 the study of the Hamath inscriptions as published in the third *Statement* of the American Palestine Exploration Society, and a little later found three or four similar characters on the so-called bas-relief of "Niobe" near Smyrna, and drew the conclusion of a great Hittite empire that covered Asia Minor and Syria during the more flourishing period of Egyptian history. His rashness was bitterly denounced by the Grecians, led by Professor Jebb, so that the followers of the two scholars were called "Jebusites" and "Hittites." We have lately told of the remarkable discovery by Dr. Winckler of two thousand inscribed tablets at Boghaz-keui, which was the chief Hittite capital. It is pleasant to learn from an article in *The British Weekly*, by Sir William R. Ramsay, the distinguished explorer of Asia Minor, that at his request Lord Strathcona, Chancellor of Aberdeen University, has agreed to give $2,500 a year for five years, for excavations of another principal site among the Hittite ruins of Asia Minor. Professor Ramsay says we may look to the soil of Asia Minor for the next most important discoveries in ancient history.

Anything so earnest as a Welsh revival among the stolid Chinese, and that as against opium, is very interesting. Such is the phenomenon reported from the Chinese at Singapore. They have the notion that a certain plant will cure the opium habit—which we much doubt—but 14,000 opium users are reported to have been cured in one district alone, and opium shops are shut up. It is well to have some such curative suggested to encourage those who wish to break off from a habit, even tho the cure is really a matter of will and suggestion.

Insurance

Some New Insurance Laws

THE International Policy-holders' Committee announced last week that bills will be presented to the New York Legislature at an early date during the present session, having for their objects the correction of some of the defects which the campaign just closed in the New York and Mutual Life companies demonstrated now exist. These bills will seek, first of all, to bring about the abolition of proxy voting as entirely unnecessary when a mail ballot obtains, and because of the claim advanced that the only province of proxy voting is to the disadvantage of the policy-holders. It is designed to so draw the new bills as to make it a misdemeanor for any agent or officer of a company to use the policy numbers in campaigning, and prohibiting even the affixing of these numbers to ballots by any one except the voting policy-holder.

The new bills also make it a misdemeanor for any officer or company agent to electioneer or take any other part in elections hereafter, and they will provide that the only valid ballots will be the official ones. It is contemplated to have these ballots sent out by the Superintendent of Insurance at the expense of the interested companies, and no other expense will be permitted in connection with future campaigns. The International Committee believes that the support of Governor Hughes will be given to the new bills.

The Governor of Massachusetts on Insurance

In his second inaugural address to the Massachusetts Legislature delivered last week Governor Guild made several recommendations regarding insurance matters. One of these recommendations had to do with reducing the cost of industrial insurance. He said in part as follows:

"Many excellent suggestions will be laid before you for insurance reform. I would particularly urge upon you two, in which I trust you will agree that Massachusetts should lead the way, as she has ever led the way in insurance legislation. The experiments are, I admit, radical, but no more radical than the original suggestion of insurance itself.

"The expense of life insurance largely consists in the cost of solicitors and collectors. If neither were necessary the insured could secure protection at greatly less expense. To the poor the expense of so called industrial insurance is very severe; to the very poor it is prohibitive. I suggest for your earnest thought and careful consideration the subject of insurance of the lives of those able to pay but a very small premium, but whose honorable pride is now in too many cases urging them to pay what they can ill afford if they would avoid a pauper's burial. Life insurance without agents or collectors is an experiment in which the demands of the people are supplemented by practical plans. I commend for your consideration the study of plans to be submitted to you for cheaper industrial insurance that may rob Death of half of his terrors for the worthy poor."

ALEXANDER JOHNSTON CASSATT, the late president of the Pennsylvania Railroad, whose death was announced in THE INDEPENDENT of last week, was insured in The Equitable Life Assurance Society for $100,000. His policy, which was one of the fifteen-year ordinary life variety, was taken out in 1899. Upon this policy, at the time of his death, he had paid eight premiums, amounting in total to $59,064.

THE Ancient and Honorable Order of the Blue Goose is the fantastic name of an order started in Wisconsin early last summer, the object of which is to furnish fire insurance. Its growth has been a remarkable feature in Western fire insurance, since the Blue Goose has acquired five hundred members during the last six months, and continues to grow at a wonderful rate. The organization is now regarded as likely to prove an important factor in fire underwriting. It is the only organization in the West in which both union and non-union field men are members.

IN the annual report of the Postmaster-General it is set forth as follows, viz.:

"The number of burglaries of post offices reported during the past year was 1,802—a notable increase over the 1,581 reported the year before. In recent years the 'yeggmen,' who sent guards to watch the street prepared to kill the citizen who interferes while one of them operates upon the safe, have devoted much of their attention to safes in post offices. When they are caught it is frequently found advisable to leave their prosecution to State courts, for there the sentences are usually more severe. A Federal statute prescribing longer imprisonment than is now provided, say, fifteen years, for burglary that involves the use of explosives would seem advisable and such legislation is recommended."

Financial

The Cotton Exchange

An attack of an extraordinary character upon the New York Cotton Exchange has been made by Representative Livingston, of Georgia, and Harvie Jordan, president of the Southern Cotton Growers' Association, who have formally applied to the Postmaster-General for a fraud order to prevent the Exchange from using the mails. While the main cause of this movement is the Exchange's rules as to differences in value represented by the various grades of cotton, the applicants in their long complaint make all sorts of charges, asserting that the Exchange is merely a gambling place, that its official quotations and its rules are fraudulent, that its business is fraudulent, that it deals in cotton which cannot be used for commercial spinning purposes, and that, by advertising its fraudulent business and quotations daily thru the mails, it seriously injures the legitimate cotton trade. Naturally, the members of the Exchange are angry, and their board of managers has authorized the counsel of the Exchange, Henry W. Taft (brother of the Secretary of War), to sue the two complainants for libel.

It seems unnecessary to say that there was no warrant for the intemperate charges of the complaint or for an application for a fraud order. There is room for argument as to the character of the Exchange's contract and as to rules for differences in value (these rules having been made before it could be foreseen that so large a part of the crop would be of low grade), and argument has been made in the Exchange itself. But it is absurd and hysterical to assert in a formal complaint that the business, quotations, rules and purposes of the Exchange are fraudulent. Cotton growers who object to the rules should have sought in some reasonable way to obtain the changes they desire.

President McCrea

James McCrea, who was elected president of the Pennsylvania Railroad Company on the 2d, is in his fifty-ninth year and was born in Philadelphia. Like the late President Cassatt, he entered the service of the company as a rodman. That was forty-two years ago. He has worked his way up, holding responsible places of various kinds and in all the divisions. For some years past he has been at the head of the entire system west of Pittsburg. He is regarded as a builder and an operator rather than as a financier, and has been notably successful in improving and perfecting the subsidiary lines taken into the Pennsylvania system. Six feet two inches tall and physically strong, he has great capacity for work. He is an approachable man, cordial in manner, and much liked by his subordinates; and he is known as a foe of graft.

....In the new statement of The Brooklyn Trust Company, of which Theodore F. Miller is president, it is seen that the capital stock is $1,000,000, the undivided profits are $2,321,875, the deposits are $17,479,502, and the total resources $20,984,616.

....The Emigrant Industrial Savings Bank, of which Thomas M. Mulry is president, and John J. Pulleyn is comptroller, has declared a semi-annual dividend at the rate of 4 per cent. per annum payable January 21st. This bank has 118,000 depositors. Its surplus is $11,000,000 and its deposits are $93,000,000.

....The report of the Bankers' Trust Company, published in response to the call of the State Banking Department, under date of December 31st, shows that the institution has continued to enjoy a marked degree of progress. The company has, since its organization, earned $777,673 in undivided profits, which show an increase for the past year—after the payment of dividends of $130,000—of over $263,000. The deposits of the company during the same period likewise show a gain in excess of $3,000,000, and are now nearly $24,000,000. The total resources of the institution are upwards of $28,000,000. The company has built up a reputation for solidity and conservatism, and the fact that its board of directors is made up exclusively of bankers accounts in large measure, no doubt, for its steady progress and the excellent business it has acquired.

The Independent

VOL. LXII NEW YORK, THURSDAY, JANUARY 17, 1907 No. 3033

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The Dismissed Negro Soldiers

Mr. Roosevelt sent to Congress, on the 14th, a special message relating to the Brownsville affair and the dismissal of the negro soldiers. It contains the additional evidence collected by Assistant Attorney-General Purdy and Major Blocksom, who were sent to Texas by the President to make an investigation. There are maps with it, and exhibits of various kinds. Mr. Roosevelt says that the outrages of August 13 were committed by some of the negro soldiers afterward dismissed, and that some or all of the members of the three companies had knowledge of the deed and shielded the guilty, whom he calls "midnight assassins." Very few, if any, of the dismissed men, he asserts, could have been ignorant of what occurred. He revokes that part of his order which barred the dismissed soldiers from all civil employment under the Government, because it was "lacking in validity," but he retains that part which prevents them from re-enlisting in either the army or the navy, as to which, he says, "there is no doubt of my Constitutional and legal power":

"The order was within my discretion, under the Constitution and the laws, and cannot be reversed save by another executive order. The facts did not merely warrant the action I took—they rendered such action imperative unless I was to prove false to my sworn duty.

"If any one of the men discharged hereafter shows to my satisfaction that he is clear of guilt, or of shielding the guilty, I will take what action is warranted; but the circumstances I have above detailed most certainly put upon any such man the burden of thus clearing himself."

——The action of the President has been supported, as a rule, by members of Congress from the South, but on the 12th Mr. Tillman made a characteristically bitter speech in opposition, asserting that the dismissal of the soldiers had been "lynching," and that Mr. Roosevelt's preaching of race equality had encouraged the soldiers to commit acts of violence. On the 7th, Mr. Lodge spoke at length in defense of the President's course, and Mr. Foraker made an argument in reply. Mr. Lodge was induced by general disapproval to withdraw the ingenious amendment by which he had sought to force a vote as to the President's Constitutional authority before action on the resolution for an investigation could be taken. At the end of last week it was understood that a majority of the President's friends in the Senate were of the opinion that he had gone beyond the limits of his authority in that part of his order by which it was provided that the discharged soldiers should not hereafter be permitted to enter the Federal civil service, and it was predicted that the part in question would be rescinded.

Bids for Panama Canal Work

Contractors' bids for the work of completing the canal were opened on the 12th at Washington. There were four of them, and the lowest was that of the firm of Oliver & Bangs, of New York City, which offers to do the work for 6¾ per cent. of the money expended. The percentages in the other bids were 7.19, 12½ and 28. Both of the partners in the firm bidding 6¾ per cent. are well known in connection with work upon large projects, and

their assets exceed $5,000,000. Within the last ten years, one of them, William J. Oliver, has done $18,000,000 worth of work. The other, Anson M. Bangs, built the Poe ship lock of the Sault Ste. Marie Canal, and the Delaware and Buffalo breakwaters. At the present time the firm is engaged upon projects representing an expenditure of $31,500,000. ——Last week Senator Flint and the ten members of the House (two from California and four from Illinois included) who have been making an investigation on the Isthmus arrived at New York. Their report as to progress, housing, sanitation, etc., was wholly favorable and in agreement with that of Mr. Roosevelt. But they insist that Chinese laborers are not needed. They say that no officer with whom they talked while they were in the Zone is in favor of the employment of Chinese, and that the supply of Spanish laborers, who are coming at the rate of 1,000 per month, is sufficient. Senator Flint and his associates, before they went to the Isthmus, opposed the employment of Chinese, and it was the main purpose of their journey to obtain evidence that Chinese were not needed.——It is said that recent borings at the site of the proposed Gatun dam have shown that a safe foundation cannot be obtained for this great structure, which is regarded as essential to the use of the lock plan. Full reports of the borings have been called for by the Senate Committee, some members of which think, it is said, that it will be necessary to make the canal at the sea level.——In the suit of Warren B. Wilson, of Washington, who sought to restrain the Government from paying $40,000,000 to the French canal company, alleging that the title of the United States to the Zone was not good, the Supreme Court has decided that the title is sound beyond question.

The Harriman Railway System

When the investigation of the Harriman railroads was resumed, in Chicago, on the 8th, the first witness was E. P. Ripley, president of the Atchison, Topeka and Santa Fé road for the last eleven years. He did not know, he said, until he read the testimony of a few days ago, that the Union Pacific had bought $10,000,000 of Atchison stock since June 30th. Two years ago he was told by Mr. Harriman that the latter and his friends had bought $30,000,000 of the stock. Mr. Harriman first, and Jacob L. Schiff afterward, proposed that H. H. Rogers and Henry C. Frick should be elected directors, as representing this stock interest, and, altho they were directors of the Union Pacific, they were taken into the Atchison board. He would have objected to the election of officers of a rival company to these places in the board, but Mr. Rogers and Mr. Frick were not officers of the Union Pacific. He regarded them as being merely representatives in the Union Pacific board of large holdings of stock. They had been loyal directors of the Atchison. He said that the Union Pacific and the Southern Pacific had competed with each other for not much business before their consolidation, and consolidation had had but little effect on this competition. But the Atchison had been, and still was, an active competitor of both. It had no agreement with them as to rates. It was true that the Atchison had leased 110 miles of road in California to Senator Clark's new road, which is controlled jointly by the Harriman companies and the Senator. J. C. Stubbs, traffic director of the Harriman system, asserted in his testimony that competition was not prevented by consolidation, because of the personal rivalry of subordinate officers. He admitted, however, that the two Pacifics had one and the same officer in each of many departments. But the two roads had not fundamentally been competing lines. Still, he was led to admit that they had been natural competitors for a considerable quantity of traffic. They were now, he said, competing as much as ever. Rates were reasonable, altho since consolidation they had been increased. Mr. Hill, he asserted, could not prevent competition between the Northern Pacific and the Great Northern, altho he controlled both. In all this Mr. Stubbs was supported by J. M. Hannaford, traffic director of the Northern Pacific, who also held that it would be better for everybody if all the roads west of the Mississippi should come under the

same ownership. But he declined to discuss the question of a Commissioner who asked if he thought a combination of all the roads of the United States under one ownership was to be desired for the good of both the roads and the public. Mr. Stubbs said he would not permit the Southern Pacific to cut rates with the purpose of drawing business from the Union Pacific. Mr. Hannaford insisted that competition between the two parallel Hill lines was now sharper than at any time in the past. But M. C. Markham, traffic manager of the Missouri Pacific, testified that the Southern Pacific and the Union Pacific had competed actively before consolidation, and that this competition was lessened afterward. Traffic Manager Hiland, of the St. Paul road, admitted that consolidation of all the roads would "take off the edge" of competition, and that consolidation had checked the competition of the two Pacifics. It was shown by the testimony of Julius Kruttschnitt, who has charge of maintenance and operation for the entire Harriman system, that there was no competition in these departments. It appears that the Harriman interests have large holdings in the express companies doing business on the system.——On the 12th there was announced an alliance which was regarded by some as evidence of intimate relations between the Harriman roads and the Atchison. The Southern Pacific had owned four small roads, and the Atchison two, in Northern California. On December 31st, all these were taken over by a new company, capitalized at $35,000,000, and controlled jointly by the Atchison and the Southern Pacific. ——At Los Angeles, on the 9th, a Federal grand jury returned two indictments, containing seventy-six counts, against the Atchison for granting rebates and other unlawful concessions to a company dealing in lime and cement. This company was also indicted.——Attorney General Hadley, of Missouri, has brought suit to dissolve the combination alleged to exist in what is called the Gould system, which includes the Missouri Pacific, the Wabash, the Iron Mountain, certain coal and express companies, and other corporations. He asserts that the natural competition of parallel roads has been suppressed.

Lynch Law in Iowa

At Waterloo, Ia., on the 9th, a mob of about 1,000 persons broke into the jail, took out a prisoner named James Cullen, and hanged him. It was nine o'clock in the evening when the mob battered down the door of the jail. Some resistance is said to have been offered by the sheriff. One week before the lynching, Cullen had murdered his wife and his stepson, a boy of fifteen years, and had then tried to commit suicide. He was an eccentric man, and some say he was demented. The people feared, it is said, that his life would be spared by executive clemency, because of the recent treatment of a murdered named Louis Busse. This man had murdered his wife. He was saved from the gallows twice by reprieves, and then his sentence was commuted to imprisonment for life. The dispatches say that there were several clergymen and many women in the mob at the Waterloo jail when Cullen was lynched.——The daughter of a farmer living six miles from Lynchburg, Va., was assaulted on the 7th by a negro who had followed her to her home as she returned from school. After the arrest of the negro he was with much difficulty saved from a mob by the sheriff, who succeeded in placing him in the jail at Lynchburg.——In an address to a grand jury at Meridian, Miss., on the 8th, District Attorney J. H. Currie said:

"Our own people, our white men, are destroying the integrity of the negro race, raising up a menace to the white race, lowering the standard of both races, and preparing the way for riots, mobs, criminal assaults, and finally a death struggle for racial supremacy. The trouble is at our own doors. It is time to rise up and denounce this sin."

Washington Topics

In the course of a debate upon the service pension bill in the Senate, last week, several Senators from the South objected to the words "War of the Rebellion," which were in the bill. Mr. Carmack moved that the words "civil war" be substituted. Mr. Money thought that the great contest would be described more accurately by the words "war between the States." After some discussion as to the causes and nature of the conflict, the words "civil war" were substituted in the bill for "War of the

Rebellion," and the bill was then passed without opposition.——Secretary Root and Mrs. Root will go to Ottawa this week, and for several days will be the guests there of Earl Grey, the Governor-General of Canada. The Secretary says that this visit will be purely of a social character. Some expect, however, that it will facilitate a settlement of certain questions at issue between Canada and the United States.——Postmaster-General Cortelyou has resigned the office of chairman of the Republican National Committee. His successor is Harry S. New, heretofore vice-chairman.——The Senate has passed, by a vote of 70 to 1, the bill to prevent railroad companies from requiring or permitting any employee on trains engaged in interstate traffic to remain on duty for more than sixteen consecutive hours, or to require an employee, after he has been at work sixteen consecutive hours, to go on duty again until he has had ten hours for rest. The original bill was Mr. La Follette's, and it had been greatly changed by amendments. It was upon his motion to substitute his original bill that a contest arose, but the vote was 36 to 32 in his favor. Then the bill thus substituted was passed.——The President has sent to Congress a message of considerable length, recommending that an appropriation of $2,000,000 be made for repairing the break in the bank of the Colorado River to which is due the inundation of the Imperial Valley in Southern California and the formation there of what is called the Salton Sea.——The passage of the pending bill to prevent the employment of children in factories by forbidding the transportation of the products of their labor by common carriers engaged in interstate commerce, has been opposed in a speech by Senator Overman, on the ground that the method is unconstitutional and that such legislation would be in violation of State rights.——The number of immigrants arriving in the last fiscal year was 1,100,735.——Senator Alger's successor will be William Alden Smith, who has represented a Michigan district in the House for ten years past. The successor of Senator Burton, of Kansas, will be Charles Curtis, whose mother was a half-breed of the Kaw tribe of Indians. For twelve years Mr. Curtis has been a member of the House.

Trust Questions

In the United States Circuit Court at New York, on the 10th, the McAndrews & Forbes Company, of New York, and the J. S. Young Company, of Baltimore, were found guilty of forming an illegal combination and maintaining a monopoly of the licorice paste industry. But at the same time the jury acquitted the presidents of the two companies, Karl Yungbluth and Howard E. Young, who were tried on the same charges. Whereupon Special Assistant Attorney-General Levy, one of the prosecutors, said: "The verdict indicates that business men will not find business men guilty of violations of the Anti-Trust law where conviction means imprisonment." The defendant companies are controlled by the Continental Tobacco Company and the American Tobacco Company, and the suit was commonly known as one against the Tobacco Trust.——R. S. Waddell, of Peoria, president of the Buckeye Powder Company, continues to oppose, by published statements and in other ways, the combination of powder companies in which Senator Du Pont is largely interested, and which is sometimes called the Powder Trust. He asserts that the Du Pont Company exacts too large a profit from the Government, and he urges that last year's appropriation of $165,000 for the manufacture of smokeless powder be increased by $3,000,000, in order that the Government may no longer be dependent upon the combination for its supply.

Labor Riots in Mexico

Strike riots in the Mexican city of Orizaba have been suppressed at a cost of many lives. In the last week of November the textile workers at Puebla went on strike. Workmen elsewhere took similar action, and the 28,000 employees of 53 factories became involved. President Diaz was asked to arbitrate. He granted some increase of wages, and on the 5th inst. it was announced that the strikers would resume work on the 7th. In the mills of Eduardo Garcin, at Orizaba, several thousand men were employed. It is said that when these were returning to

work on the 7th they were induced to continue the strike by the exhortations of a woman, who denounced them for cowardice. Then the strikers looted the company's store, burned the building and took much property from the houses of citizens. Two regiments were sent to Orizaba. On the 8th the strikers attacked the mills in the neighboring town of Nogales. When the troops came they resisted, whereupon 30 strikers were killed and 80 wounded. The mob was dispersed, and many of the rioters fled to the mountains. On the preceding day Mr. Garcin escaped from the strikers in a curious way. He hid himself in a sack and was carried thru the mob on the shoulders of a faithful servant, who said, in answer to the strikers' questions, that the sack was full of beans. The value of the property destroyed in Orizaba is reported to have been $1,500,000. On the 12th, 5,500 of the strikers there returned to work. In their sight, as they were approaching the mills at an early hour, seven of the leaders of the mob were executed by a squad of soldiers, who shot them after placing them in line upon the ashes of the burned store. Two of the men thus punished were Rafael Moreni, president of the workmen's union, and Manuel Juares, secretary of the same organization.

The German Colonial Question

The present campaign for the Reichstag elections is of the greatest importance in the history of Germany, because the Kaiser, in dissolving the Reichstag, has appealed direct to the people for support to his colonial policy. Neither the Conservatives nor the Liberals are inclined to accept the recommendation of Chancellor von Bülow that they unite in support of the Government in order to counteract the opposition of the Clericals and Socialists in the Reichstag. On the other hand, the Clericals in eight of the election districts of the Rhine Province have condemned what they call the unpatriotic course of the leaders of the Center party, and have nominated Nationalists. The greatest aid to the Government side has come from Herr Dernburg, who has been making some vigorous and telling speeches in favor of the Government's colonial policy. The Kaiser has reason to congratulate himself on the appointment of Herr Dernburg as Director of the Colonial Office, altho the bureaucrats were highly indignant at the appointment of a Jewish business man to this important post as the successor to Prince Hohenlohe-Langenburg. Herr Dernburg, who got part of his business training in this country, makes use of his knowledge of American conditions and politics in enforcing his arguments. In regard to the charge of mistreatment of the natives, he points out that even in the United States there occur similar atrocities to those which the Center brought against the Government in the recent Reichstag debate, and that the negro question is still the most serious problem of the greatest republic in the world. Against the charge that German Southwest Africa is barren and worthless he quotes the experience of the United States in the acquisition of Alaska and Oregon, which was opposed on similar grounds. Germany must secure colonies in order to be independent of other countries for raw material and food supplies. He stated that West Africa could send Germany cotton of the American grades, while East Africa produced the Egyptian qualities, and the cotton lands of Egypt and Texas were three or four hundred times as expensive per acre as those of German Africa. Copper mines were also being opened at at Otavi, German Southwest Africa, and wool, hemp, rice, coffee and similar products to supply German industrial needs could be obtained from the African colonies. Germany requires annually $35,500,000 worth of rubber, of which only $1,500,000 is now obtained from her colonies. The rest has to be bought at high prices from Americans and the British, who control all the principal sources of supply. The Americans are crowding out the Germans in Brazil and on the west coast of South America. Japan and the United States are gaining on Germany in supplying the Chinese market. The highlands of German Southwest Africa and East Africa afford an area twice as large as Germany, which can be settled by Europeans. It is necessary for Germany to pursue an aggressive expansion policy in order to hold her own against the English-speaking race.

In the middle of the eighteenth century there were only 9,000,000 English-speaking people against 20,000,000 Germans, while today 120,000,000 speak English and only 70,000,000 speak German.

The Pope's Position on the Separation Question

Just previous to the opening of the council of the French bishops in Paris, on January 15th, Pope Pius X issued an encyclical to the French Catholics stating the position of the Church on the separation question. He states that the Church did not seek a religious war or court persecution, but this was forced upon him by the attacks of the French Government, which were directed not only against the Christian faith, but against all spiritual ideas. French Catholics must remain united both among themselves and with the Holy See. The importance of this is shown by the efforts of the enemies of the Church to destroy this union. It was impossible for the Church to accept the conditions of the Separation Law, because it imposed upon the Catholics an organization which would imperil the existence of the Church as a divine institution. The proposed cultual associations were contrary to the ecclesiastical hierarchy given to the Church by the Divine Founder himself. Therefore, the Church must endure the unjust spoliation now going on rather than submit to the law. The annual declaration required for public worship according to the law of 1881 did not offer any legal guarantee which would insure the independence of the Church against governmental aggression:

"It remains to examine the law recently voted by the Chambers. From the point of view of Church property the law is a law of spoliation and confiscation and has consummated the pillage of the Church. Altho her Divine Founder was born poor in a stable and died poor on the cross, and altho she knows poverty from the cradle, the property she was possessed of none the less belonged to her, and no one had the right to deprive her of it. This ownership, indisputably hers from every point of view, has been officially sanctioned by the State. The statement that the Government disposed of the abandoned properties of the Church is adding derision to spoliation.

"From the point of view of the exercise of religion the new law has organized anarchy. It installs a régime of uncertainty and arbitrariness. There is uncertainty as to whether the churches, which are always liable to disaffection, shall or shall not in the meanwhile be at the disposal of the clergy and faithful. In each parish the priest will be in the power of the municipality, with the consequent possibility of conflicts in all parts of the country. In addition the clergy are under an obligation to meet the heaviest expenses while their sources of revenue are subjected to the strictest limitations. The new law aggravates the law separating Church and State. We can only condemn it with precision and without ambiguity.

"Certain articles of the law throw new light on the real aim of our enemies. They wish to destroy the Church and de-Christianize France without attracting too closely the attention of the people. If their course was really popular, as they pretend it is, they would pursue it openly and take all the responsibilities.

"Instead, against the rising tide of popular reprobation, the Government attempts to throw the responsibility on the Church, its victim, but the object will not succeed. As for us, we have done our duty as any other Roman Pontiff would have done it. The high office with which Heaven invested us, as well as our faith in Christ, determined our line of conduct, and we could not have acted otherwise without betraying our conscience or breaking the oath we took when we mounted the throne of St. Peter.

"Therefore we await fearlessly the verdict of history, which must be that with our eyes fixed unceasingly on the transcendent rights of God we did not intend to humiliate the civil power nor combat a form of government, but only to safeguard the spiritual temple of Christ.

"What we demanded and demand for the Church, of which France is the eldest daughter, is respect for her hierarchy, the inviolability of her property and liberty. If that had been granted the religious peace would not have been disturbed, and the day our demand is heeded the longed-for peace will be restored.

"Assured in advance of your magnanimous generosity, we did not hesitate to tell you that the hour for sacrifice had struck, and to recall to the world in the name of the Master of all things that man here below must have a goal above the perishable things of earth, and that God, honored, served, and loved despite all, is supreme joy."

"In full confidence that the Virgin Immaculate, daughter of our Father, mother of the Word, spouse of the Holy Ghost, will obtain for you from the most holy and adorable Trinity better days, from the bottom of our hearts we give you, venerable brothers and the whole people, our apostolic benediction."

Russian Assassinations

The news from Russia continues to be nothing more that a monotonous record of apparently futile assassina-

tions of police officials. The most important victim of the Terrorists during the week was Lieutenant-General Vladimir Pavloff, who was shot while walking in the garden of the Military Court building. The assassin was captured after having shot a policeman and wounded a boy, and was hanged two days later without disclosing his identity. He wore the uniform of a military clerk attached to the Court, and his arrest has disclosed the existence of a secret organization of revolutionists among the clerks of the army and engineer corps. General Pavloff incurred the enmity of the revolutionists by the numerous executions which he conducted by summary courts-martial after the suppression of the rebellion in the Baltic Provinces. When called before the Duma he justified his action in such a defiant and contemptuous manner that the members were aroused to fury and drove him from the hall with shouts of "Murderer!" and "Hangman!" The chief of gendarmes in the Lodz district and the chief of police of Daghestan have been assassinated by Terrorists. Altho the issue of the election is uncertain it looks as tho the Socialists and Constitutional Democrats would be strongly represented in the new Duma, notwithstanding the efforts of the Government to prevent this by ingenious police regulations. If the new Duma adopts an attitude of opposition similar to that of the old, it is predicted that it will be dissolved and a more restricted election law requiring property qualifications for voters will be put in force. In St. Petersburg the number of electors registered is 136,171. Political meetings are being held in all the cities, altho under close police vigilance. Meetings can only be held when they are in charge of persons of good charcter and approved by the police. They may be attended only by the electors of the district where they are held. The chief of police must attend each meeting with an adequate force, and disperse it if any revolutionary cry is uttered or if the speeches are calculated to excite one section of the populace against another, or if the Government is attacked, or if money is collected

The New Shah and the Constitution

Muzaffer-ed-Din Mirza, Shah of Persia, died on January 8th, and his son, Mohammed Ali Mirza, immediately succeeded to the Peacock Throne. The day for his coronation has been fixed by the court astrologers on February 2d as the most auspicious date. There was no opposition to his accession in Teheran, and he will have the support of the two dominant and rival foreign Powers in Persia, Russia and Great Britain. It is reported, however, that Aboul Fath Mirza, the third son of the late Shah, has taken up arms against his brother with a force of 10,000 men in the mountains of Luristan. Whether the rebellion spreads to the capital will depend upon the attitude of the new Shah in this crisis. He is supposed to be somewhat reactionary in his political views, and during the weeks that he has been awaiting his father's death he has been in conflict with the newly elected National Assembly over the conditions of the constitution they had prepared. The Crown Prince wished to have the Senate composed largely of his own appointees, but the members of the Assembly would not consent to this. Finally a compromise was effected, and a constitution providing for a Senate of 60 members, half elected and half appointed, was signed on January 2d by the late Shah. On the following day Persia's first National Assembly was duly organized. The constitution gives the Assembly control of all financial matters, including local and foreign loans and commercial treaties and of the formation of domestic and foreign companies for the construction of railroads and other public works, but in matters relating to the administration of the provinces the Assembly has only the right of discussion. The Assembly can only be dissolved with the consent of the Ministers and two-thirds of the Senate. The new Shah was born in 1872, and has received a European education. His sympathies are said to be rather with Russia than England. An unfavorable impression was created by one of his first acts, which was the recall from Khorassan of Ain-ed-Dowleh, the conservative Grand Vizier, who was

forced to resign by the popular rising which brought about the new constitutional Government. For a portrait of the new Shah and an account of the inauguration of the Persian Assembly the reader is referred to articles by our Persian correspondent in THE INDEPENDENT of November 29th and September 20th.

Conditions in Turkey

A correspondent in Turkey writes us that in Erzrûm, which borders on Russia, the people have been learning something from the example of the rebels against the Government. The Mufti and some others, who had taken the part of the people in resisting the payment of some new taxes, were seized by imperial order during the night, gagged and put into wagons and started on the road to Constantinople. An alarm was given. Several thousands of people gathered. The chief of police and his son and an assistant were murdered and their bodies mutilated. The Vali was imprisoned in a mosque and the banished men were hurriedly brought back and for four days the markets were closed. The Vali was finally allowed to leave for Constantinople and the Vali from Harpût was sent to take his place and try to bring order out of the general chaos. The economic conditions all thru that part of Turkey have for years been poor, but there is a steady decline to still lower depths. There is little business. Permission to travel to different parts of the country is obtained with great difficulty. Intercourse with other countries is positively forbidden, so that men who are in America and wish to join their families are not allowed to come, and if they smuggle themselves into the country they are summarily sent away. Work is very difficult to obtain, even at very small wages. In the region of Van the situation is particularly desperate, and food has reached almost famine prices. The work of the American missionaries is carried on with increased success, but help is needed for the enlargement of the college premises at Harpût and for the support of the orphanages and hospitals.

Famine in China

The reports indicate that the famine which prevails in the north of Ngan-whei, the east of Ho-nan and the north of Kiang-su is worse than any China has experienced during the last forty years. It is estimated 4,000,000 people are in danger of starvation. In the refuge campus at Tsing-liang-pu there are 450,000 destitute persons, many of them entirely without support. Relief work has been ordered, but the Chinese officials have been dilatory in starting it. Women and children are to be seen everywhere tearing up grass and roots and gathering leaves and twigs for cooking. Fifteen thousand bags of American flour have been purchased and will soon be distributed. The American Red Cross has issued an appeal to the people in this country for $150,000 to purchase a ship load of flour and corn meal for the sufferers. The Pacific Mail Line has promised free transportation to Shanghai. In Canton at a large mass meeting it was resolved to renew the boycott on American goods and to dissuade laborers from going to Panama in order to force the American Government to modify the oppressive features of the exclusion law. The British merchants at Shanghai and Hongkong are seeking indemnity from the Chinese Government for the loss they will sustain on account of the prohibition of opium. India now produces and exports to China annually opium to the value of $38,950,000, and enormous stocks are now on hand in the treaty ports. The British Government has announced that it will not oppose, as it did formerly, the prohibition of the opium trade. It is reported that China will call a conference of the Powers to discuss the question of political and commercial interests in Manchuria. The United States, Germany, Great Britain, Russia and France will be invited to send representatives. An imperial edict has been issued raising Confucius to the dignity of a god having the same rank as Heaven and Earth, whom only the Emperor is worthy to worship. It is said that this is done in order to relieve the Christian students in the Government colleges from kotowing to the memorial tablet of Confucius which is placed in all such institutions.

Poverty: Its Cause and Cure

BY JAMES MACKAYE

[Several months ago students of social science were surprised by the appearance of a large and comprehensive work, entitled "The Economy of Happiness," from an unknown author, expounding an original theory of human society and advocating radical methods for its future development. Amid the present flood of literature of social reform, well intentioned but mostly half thought out and loosely written, this book was distinguished by its thoro analysis of the factors involved, and especially for the scrupulous care taken by the author to define all the terms he used. A long review of "The Economy of Happiness" will be found in THE INDEPENDENT for October 4th. In the following article the author applies his theory and method to the question of poverty. Mr. MacKaye is a graduate of Harvard and a technological chemist by profession.—EDITOR.]

IF it is assumed that the objects to which the policies of society should be directed are the increase of happiness and the decrease of unhappiness among men, it at once becomes obvious that society should seek to abolish all causes of pain. Poverty is one of the commonest and most effective causes of pain known to man, and hence should, if possible, be abolished. I propose, very briefly, to discuss the problem of poverty in order to suggest a means of abolishing it. To this end I shall consider first what poverty is, second what causes it, and third what may cure it.

First: *What is poverty?*

Poverty is simply a name for a deficient rate of consumption of wealth per capita. Any normal member of society, whose means of subsistence and recreation are insufficient to make him happy, suffers from poverty, and hence produces the very thing which society should avoid producing—pain. The absence of poverty may be called prosperity.

Second: *What causes poverty?*

Poverty is an effect of some cause or causes. Therefore if any considerable number of the normal members of society suffer from poverty it is because one or more of the causes of poverty are present. If so, one or more of the causes of prosperity must be absent. Let us, then, seek to discover the cause or causes of poverty by discovering the cause or causes of prosperity.

In order to achieve a condition of prosperity thruout society, the following three requirements must be met:

(1) *A sufficient rate of production of wealth per capita.* (2) *A substantially equal distribution thereof.* (3) *A degree of simplicity in the tastes and needs of the normal members of society such that the actual rate of production of wealth is sufficient reasonably to satisfy them.* A community in which these three requirements are met will be free from poverty. One in which they are not met will not be free. In order to reveal the causes of poverty, let us discuss briefly, but systematically, each of these three requirements of prosperity.

First requirement: The rate at which wealth can be produced by a community is a function of two variables: (1) The availability of natural resources—*i. e.*, the natural adaptability of the raw materials supplied by the earth to the uses of man. (2) The degree of advancement of the productive arts—*i. e.*, the degree of development of the artificial facilities for converting said raw materials to said uses.

As any given land area increases in population the raw materials supplied by the earth are progressively developed, the most easily available being utilized first. The most fertile soils, the best timber ranges and the most easily accessible coal and ore deposits are taken by the first comers, and as the population increases in density, the natural resources diminish in availability, poorer and poorer soils, timber lands and mineral deposits are resorted to, the cultivation of the soil becomes more intensive, and thus the return in wealth for a given expenditure in labor tends to progressively diminish. This is known as the *law of diminishing returns.*

The exhaustion of natural resources which results from the operation of this

law may be offset by developing the productive arts thru the invention of machinery and the organization of industry. The more mechanical devices are introduced into industry, the easier it becomes to convert the raw materials supplied by the earth to the uses of man, and the greater will be the return in wealth for any given expenditure of human labor. This may be called the *law of increasing returns.* It is evident then that, other things being equal, the poverty of a community will increase when the law of diminishing returns is stimulated more effectively than the law of increasing returns, and will decrease when the law of increasing returns is stimulated more effectively than the law of diminishing returns. Therefore, so far as the first requirement of prosperity is concerned, it would appear that the way to cure poverty is to stimulate the operation of the law of increasing returns and impede the operation of the law of diminishing returns. Nature, however, tends to do exactly the opposite of this. In the absence of special precautions every community in the world spontaneously adopts a policy which progressively stimulates the operation of the law of diminishing returns, and thereby plunges itself into poverty. New nations are better off in this respect than old, only because they have not yet had time to run their normal course. The tendency toward national impoverishment thus referred to is of transcendent importance as a factor in the problem of poverty. It is known as the *law of Malthus,* and may be explained as follows:

Man, in common with other organic beings, tends to increase in numbers in a geometric ratio. In new countries the population has often been known to double itself in twenty-five years by propagation alone. Darwin has calculated that should man everywhere increase at this rate for a period of 1,000 years "there would literally not be standing room for his progeny" on the earth. Wherever there is plenty of cheap and fertile land the natural increase of mankind approximates this rate, but such a rate is unknown in countries whose population is dense. Now why is the rate of increase of population in densely populated countries slow? It is because the earth will not yield the subsistence required for a rapid rate. That is, it is due to the operation of the law of diminishing returns, which becomes more and more marked as the population increases in density. The time must eventually come when the domain, however carefully cultivated, is unable to support a larger number of persons. The population is then in equilibrium—the death rate equals the birth rate—the law of diminishing returns is in full operation, and poverty is at a maximum.

Other things being equal, the older a nation is, the nearer it approaches a condition of equilibrium. China and India, the oldest nations in the world, are practically in equilibrium. Their poverty is greater than that of any other nation, and even a partial crop failure dooms thousands, or even millions, of the inhabitants to death by starvation. Were it not for the restrictive effect of the law of diminishing returns, all nations would soon have populations far greater than the whole earth has today. For example, if we assume the present population of the United States to be 80,000,000, and assume that it could double every twenty-five years—*as it did without difficulty in colonial days*—then in one century the country would have a population of 1,280,000,000, in two centuries a population of 20,480,000,000, and in three centuries a population of 327,680,000,000. These figures show more clearly than any argument that there must be a check on the increase of population in all nations, operating progressively as the density of population increases, and that it is already in evidence in the United States.

As in any population in equilibrium the death rate must equal the birth rate, it is clear that an increasing population can come to equilibrium in only two ways: (1) By decreasing its birth rate. (2) By increasing its death rate. Experience shows that nature always adopts the latter of these ways. In India, for example, the birth rate is one of the highest in the world, yet the population increases little if at all, and in famine years it actually decreases. Now, unless provision is made to check the birth rate, all nations will eventually be brought to natural equilibrium by an increase in their death rate, for populations left to nature continually

tend to increase to the extreme limit set by the available means of subsistence. This is the law of Malthus.

From these considerations it is obvious that poverty cannot be permanently abolished without discovering means of suspending the operation of the law of Malthus. Stimulating the operation of the law of increasing returns alone will not accomplish the object. Indeed, in the end, it will increase instead of decrease poverty. No greater stimulus to the operation of that law was ever applied than by the invention of agriculture. Yet see what it has done for the nations of the East. If the inhabitants of India, for example, still lived by the primitive method of the chase they would, as now, be in a condition of natural equilibrium, but their misery would be vastly less than at present, because their numbers would be vastly less. To be sure, hundreds of thousands would be in the direst poverty and misery, but today, as a direct result of the invention of agriculture, hundreds of *millions* are in that condition. In other words, *to stimulate the operation of the law of increasing returns without suspending the operation of the law of Malthus must, in the end, constitute a cause instead of a cure for poverty—a curse to mankind instead of a blessing.* This is the most important truth to be derived from a consideration of the first requirement of prosperity.

Second requirement: For the purpose of discovering the condition of society which must be realized in order that the second requirement shall be met, it will be convenient to divide the members of society into two classes: (1) The producers. (2) The non-producers.

As in a family, so in a community, "many hands make light work." The work of the world, as of the household, should bear heavily on no one if each bears his proper share. In a properly ordered community all able-bodied adults should constitute the producing class, bearing the principal burden of the world's drudgery, the men, as a rule, operating the industries which create the wealth of the community, the women, as a rule, carrying on the work of the household. The non-producing class should include the children of the community, the aged, and those defective in faculty, mental or physical.

Selecting the family as the most convenient fundamental unit of society, it should consist, in general, of both producers and non-producers, the former being the support of the latter in each family. Now, a condition of substantial equality in the distribution of wealth will result if society is so organized that the average family shall be *self-sufficient*—that is, shall consume the equivalent of what it produces, and that all means by which persons properly belonging to the producing class can live upon the labor of others shall be done away with. If this condition is not met an inequality in the distribution of wealth will result, for affluence is nothing more than a condition of overconsumption, as poverty is nothing more than a condition of underconsumption, and if a community is so constituted that some classes consume more than they produce it can only be because other classes consume less than they produce. It is certain that in any community the natural variation in the habits of industry and thrift among individuals will produce some degree of inequality, but this cause alone is insufficient to produce the extreme and chronic condition of inequality to be observed in civilized communities of our day.* As a means of fulfilling the second requirement of prosperity, then, a condition of self-sufficiency of the average family in the community is necessary and sufficient.

Third requirement: As poverty is but a deficient rate of consumption per capita, and as any rate thereof which results in happiness is not deficient, it is clear that whether an individual can be classed as in a condition of poverty or not will depend upon the rate of consumption of wealth required to make him happy.

Men may achieve happiness in either one of two ways: They may get what they like, or like what they get. They may adapt their means of consumption to

* In 1900 the per capita wealth of the United States was estimated to be $1,235.86. The average family contained 4.7 members. Thus the wealth per average family was $5,808.54. The statistics given by Charles B. Spahr in "The Present Distribution of Wealth" would indicate that less than ten per cent. of the families in the United States possess an estate so large. If deficiency of wealth under the present system is to be attributed to indolence and extravagance then, it looks as if about ninety per cent. of the population were chargeable with those defects.

their desires, or they may adapt their desires to their means of consumption. Now it is obvious that the fewer an individual's needs and the simpler his tastes, the more easily may the first be relieved and the second gratified; whereas the more numerous his needs and the more extravagant his tastes, the greater will be the rate of consumption required to satisfy them. Consequently, other things being equal, the less the needs and the simpler the tastes of a community the less will be its poverty. But human nature is so constituted that as the available rate of consumption of an individual increases, his needs increase with it. The more accustomed a person is to luxury, the less easy it is for him to dispense with it. The poor clothes, food, shelter and conveniences of life of our ancestors would, for example, cause us much more unhappiness than it caused them, and a condition of consumption which would be poverty to the rich would be prosperity to the poor. This tendency of human nature to increase its needs with increase in the means of satisfying them may be called the *law of increasing needs.*

By the proper kind and degree of education it is possible to offset this law. By deliberate training of the desires, aspirations and interests of men, their needs can be caused to diminish and their tastes to be simplified. Other things being equal, the more the law of increasing needs is stimulated into operation in any community, the more will its poverty increase, whereas the more educative influences tending to offset it are set in operation, the more will its poverty decrease. This is the lesson to be learned from a consideration of the third requirement of prosperity.

To summarize: Poverty will be cured if the three requirements of prosperity are fulfilled. To fulfil the first requirement the operation of the law of increasing returns must be sufficiently stimulated, and that of the law of Malthus suspended. To meet the second requirement a condition of self-sufficiency of the average family must be secured. To fulfil the third requirement the law of increasing needs must be offset.

Having thus sufficiently analyzed the cause of poverty to be able to specify the conditions of its cure, let us next proceed to seek that cure by discovering what policies society must pursue to fulfil the conditions thus specified.

Third: *What will cure poverty?*

In the present condition of public opinion it will be useful to specify first a class of policies which will *not* cure poverty, to wit, those which nations have heretofore pursued, and are at present pursuing. No modern community, if we except a few small and youthful ones in Australasia, is even measurably free from poverty, and in most nations it is the chronic condition of the great majority. History has even a worse record to show. Christ said: "Ye have the poor always with you," and since His time the policies of society have been consistently directed to the highly successful production of poverty, to the end that "it might be fulfilled as was spoken by the Prophet."

Yet it cannot be denied that within the last century or two some great force has been in operation tending to the amelioration of poverty in civilized states. Despite their present unfortunate condition, the people of the states of western Europe are, on the average, better off than they were in the eighteenth century; and at no recent period has the population of those states increased so rapidly as during the nineteenth. There are several causes for this condition, but the principal one is not difficult to discern. The mighty force whose operation has produced this result has been the law of increasing returns, stimulated to an activity never before equaled by the application of modern science to the productive arts thruout the whole range of industry.

Thus the modern industrial policy of the Western World, which stimulates so successfully the operation of the law of increasing returns, must be credited with having solved one of the difficulties involved in the problem of poverty. It has met one-half of the first requirement of prosperity. This is highly important, but before passing judgment on that policy as a means of curing poverty, we must examine its further effects. It promotes the operation of the law of increasing returns, but does it tend to suspend the law of Malthus? If it does not, then its effect on the law of increasing returns will, as we have already shown, in

the end, prove a curse instead of a blessing. It will increase instead of decrease poverty. Now the extraordinary spurt which the populations of the more advanced nations of western Europe have taken in the nineteenth century, shows that the law of Malthus is still in operation. Even in such crowded countries as Belgium, Holland, Italy and Spain the birth rate exceeds the death rate, and the amelioration of poverty which improvement in the arts has brought about, is tending to become offset by the resulting growth in population. No amount of increase in total wealth, even with equality in its distribution, can cure poverty so long as the population so increases as to bring the wealth per capita back to its original condition of deficiency, for poverty is due to a deficiency, not in total, but in *per capita* wealth, and the difficulty with the present system thruout the civilized world is that while it increases the total wealth permanently, it increases the per capita wealth only *temporarily,* since however much, under that system, the operation of the law of increasing returns may tend to increase the per capita means of subsistence, the resulting increase in the population soon nullifies the benefit. Thus the present policy of nations does not meet the first requirement of prosperity.

When we examine the effect of present policies on the second requirement of prosperity we find a further failure. The inequality in the distribution of wealth in all civilized states is everywhere acknowledged. This is due to several causes, such as vicious systems of taxation, inadequate education and consequent shiftlessness, etc., but the chief cause is to be found in that unique feature of the capitalistic system known as *profit.* The ownership of capital permits the capitalist to avail himself of a large portion of the labor of the wage-earner. This portion is called his *profit,* and thru its accumulation the bulk of the wealth of society is directed steadily into the possession of the capitalist class. The system of capitalism inevitably divides society into two classes, one of which is supported by the other. Such a condition is entirely incompatible with the self-sufficiency of the average family. It always has led, and it always will lead, to extreme inequality in the distribution of wealth, and the policy which permits it can never result in the fulfilment of the second requirement of prosperity.

Nor is the present system any better adapted to meet the third requirement. Under the reign of the commercial ideals of a world consecrated to "business" the old puritanical and monastic ideal of asceticism has been effectively dispossessed — and good riddance to it. Asceticism is devil-worship. It is practiced in the fear of a being—fortunately fabulous—who delights in human suffering, deeming it essential to "the manifestation of his glory." But, unfortunately, our business civilization has but replaced one base ideal with another. Commercialism has substituted money-worship for devil-worship, and has transferred the allegiance of mankind from Moloch to Mammon. Success is the modern ideal, and the measure of success is wealth. Yet wealth is the most unsatisfying of ideals, for few are content with the amount of it they can secure, and whatever the amount, whether much or little, they always want more, and the more they have the more they need. This love for, and pursuit of, wealth is contagious, infecting practically the whole of modern society, and obviously tends to stimulate, instead of to suspend, the law of increasing needs. Under this stimulus expensive needs are cultivated more than inexpensive tastes, luxury is sought and simplicity slighted, and hence the third requirement of prosperity fails to be fulfilled.

Thus if we examine the policy of modern states we discover that it fails to meet all three of the requirements of prosperity. True, it meets one-half of the first requirement, and so creates a delusion of prosperity from which posterity must awaken to a reality of poverty unattained and unattainable by the less civilized communities of the past. In the face of this universal delusion it cannot be too insistently reiterated that to meet the first half of the first requirement of prosperity without meeting the second, is but to employ a possible means of happiness as a certain means of mis-

ery. It is but to enlist the ingenuity of man in the service of his own ruin.

Having thus specified a policy which *will not* cure poverty, and pointed out why it will not, I shall now seek to specify a policy which *will* cure poverty, and to point out why it will.

The policy to be briefly described here has been more elaborately expounded elsewhere* under the name of *pantocracy,* a term signifying the rule of the conduct of all in the interest of all, and intended to denote any policy which employs the *means* of science or common sense to attain the *end* of utility — the happiness of humanity. As applied to the United States, the particular pantocratic policy which I propose as a means of curing poverty contemplates the features outlined in the following eight sections:

(1) Acquisition by the government of all public utilities, meaning by that term all utilities the conduct of which affects the interests of the public, including not only the railroads, telegraph lines and other means of communication, but the insurance, coal mining, meat packing and other great industries of the country. These means of production and distribution should not be taken over all at once, but gradually and experimentally, so that the assumption by the government of its proper functions shall not result in chaos, or in crude and unsuccessful policies of administration. This is the policy known as *Fabian socialism.*

(2) Organization of each publicly owned public utility on the same lines as the Post Office, whereby the output shall be regulated by a *Department of Distribution,* in such a manner that it shall be of the quantity required to meet the demand. Just as the Post Office adapts the supply of stamps, wrappers, postal cards, etc., to the demand for them thruout the country, and provides stations for their distribution, so all publicly owned commodity producing industries could, and should, adapt their supply to the public demand, and provide stations thruout the country for the purpose of distributing their output. Thus one, or a few, government distributing stations in every town would suffice to supply most, and perhaps, in the end, all, of the commodities required by the public. In small settlements, one, in large cities, a number, of distributing stations should be provided, just as in the case of the Post Office. Such an organization of distribution—impossible without public ownership—would do away with our present enormously wasteful methods of distribution, and constitute an improvement in the industrial machinery of the nation measurably comparable with the invention of agriculture.

(3) Organization of a national *Labor Exchange,* by means of which the supply of labor could be adapted to the demand in a manner similar to that whereby the Department of Distribution would adapt the supply of commodities to the demand. The function of the labor exchange should be: (1) The distribution, by means of the public distributing stations, of information relative to all vacancies, or prospective vacancies, in the government works thruout the nation. (2) The custodianship of applications in writing for said vacancies, or prospective vacancies, from any and all citizens qualified to apply. (3) The notification of all applicants of their appointment, and specification of the time and place at which to enter upon their new duties.

(4) Organization of an *Inspection Bureau,* the function of which should be to fix the standards to which commodities must conform, and to see that they conform to them. It should regulate the quality of products as the Department of Distribution regulates their quantity. As we shall presently point out, the duties of an inspection bureau, under pantocracy, would involve none of the difficulties to be met under present conditions, since the incentive supplied by the present system to adulteration, substitution and swindling would be absent.

(5) Institution of a policy of production whereby the antagonism of interest of the present industrial system is replaced by an identity of interest, to the end that the united power of men's self-interest shall be employed in the task of curing poverty, instead of the disunited power of their self-interest employed in the task of causing it. The means where-

* The Politics of Utility. Chapter 4.

by pantocracy attains this result are very important, and tho they cannot here be specified in detail, the principle employed may be illustrated.

Industrially man exists in a dual capacity—as a producer, and as a consumer. As a producer he is generally either a buyer of labor—an employer, or a seller of labor—an employee. As a consumer, he is always a buyer of the product of labor. Now, under capitalism, there is an essential antagonism of interest between buyer and seller, and hence between employer and employee, on the one hand, and between producer and consumer, on the other. The buyer, either of labor or of the product of labor, wishes to buy low, and the seller to sell high. This is the essence of the material opposition of interest which permeates the modern economic system. When, under the present system, a wage earner wishes to sell his labor to an employer, he knows that his desire to receive high wages and short hours will be met by the desire of the employer to give low wages and long hours; and when a consumer wishes to buy from a producer he knows that his desire to receive products of good quality at a low price will be met by the desire of the producer to give products of poor quality at a high price.

Now pantocracy completely reverses this attitude. It makes the self-interest of all classes of the community identical. Its policy is so constructed that the desire of the employer (or the pantocratic homolog of the employer) to give the wage earner high wages and short hours is as great as the desire of the wage earner to receive them; and that the desire of the producer to sell products of good quality at a low price is as great as the desire of the consumer to have him do so. This result is accomplished by the practice of the policy now to be described.

The government in its capacity of proprietor of all national public utilities would hire, for the purpose of conducting them, two classes of employees: (1) wage earners, (2) directors or managers.

The compensation of the wage earners should be a wage, fixed by law, as in any department of government, such as the Post Office, the amount thereof being determined in the same manner, namely by the skill and experience required in each case. Provision for promotion or discharge should be made, as at present under the Civil Service, so that the advancement or lack of advancement of a wage earner should be a function of his merit or lack of merit, and not, as at present, be determined by the whim of an employer.

The compensation of the directors or managers, who would be the homologs of the present class of capitalist managers, should be of two kinds: First, a wage, fixed by law, and proportional in amount to the skill and experience required. Second, conditional compensation determined as follows:

In any commodity producing industry it is easily possible to determine the average time required to complete a given product. Call this the *producing time* for that product. It will be a function of several things, but principally of the mechanical facilities at the command of the producer, and the skill and zeal with which he employs them in production. In an industry producing several different commodities, the producing time of the several commodities, divided by the number of different commodities, may be called the *average producing time*. Now the compensation awarded the director of a given industry, in addition to his salary, should be, at any given time, conditional upon the percentage decrease in the average producing time which has been achieved since he entered upon his duties. This method of compensation would supply all the incentive now supplied by profit to improve the arts, while not supplying the incentive now supplied by profit to oppress the producer with low wages and long hours, and the consumer with inferior products and high prices.

As an illustration of how conditional compensation should be employed as an incentive to improve the productive arts, let us assume an industry the average producing time of which is, on a given date, 100 minutes. Assume further the salary of the chief director to be $5,000 per year, and his conditional compensation to be fixed by law at a rate which will yield him $2,000 per annum for every five per cent by which, under his administration, the actual producing time is diminished. The following table indicates how the compensation of such an

industrial director would increase as the producing time decreases:

Average producing time. Minutes.	Decrease in average producing time. Minutes.	Conditional compensation. Dollars.	Total compensation. Dollars.
100.	0	0	5,000
95.	5.00	2,000	7,000
90.25	4.75	4,000	9,000
85.74	4.51	6,000	11,000
81.45	4.29	8,000	13,000
77.38	4.07	10,000	15,000
73.51	3.87	12,000	17,000
69.83	3.68	14,000	19,000
66.34	3.49	16,000	21,000
63.02	3.32	18,000	23,000
59.87	3.15	20,000	25,000
56.88	2.99	22,000	27,000
54.04	2.84	24,000	29,000
51.34	2.70	26,000	31,000
48.77	2.57	28,000	33,000

Of course, as the actual producing time diminishes, the difficulty of further diminishing it increases, and this should be recognized in establishing the rate of conditional compensation, and in the above table it is recognized, in a measure. Thus the increase in conditional compensation for a decrease of 25 per cent. in the original producing time would be about $11,000, whereas for a decrease of 50 per cent. it would be nearly $27,000. Under such conditions the amount of compensation which a managing director received could be made an accurate index of the degree in which he had benefited the community by decreasing the producing time of commodities. It is obvious that managers of particular departments of an industry could be similarly stimulated to improve the arts in their departments by decreasing the producing time of the commodities, or portions thereof, which it was their function to produce.

We thus see how the self-interest of the directing class is, by pantocracy, directed to decreasing the producing time of commodities. Let us next see how the self-interest of the wage earning and consuming classes is directed to the same end.

It is evident that a decrease in the producing time of commodities can be made to accrue to the benefit of a community in two ways: (1) It can diminish the working hours of the community. (2) It can increase the rate of consumption per capita of the community by increasing the rate of production per capita. If the first policy is exclusively adopted, then the community is benefited only in its capacity as a producer. If the second policy is exclusively adopted, then the community is benefited only in its capacity as a consumer. If both policies are adopted then it is benefited both as a producer and as a consumer. Hence to make the interests of director, wage earner, and consumer identical, the third policy must be adopted. Pantocracy accomplishes this by what is called the *industrial coefficient,* a fraction which determines in just what ratio the benefit of reduced producing time thruout the nation shall accrue to producer and consumer respectively. The industrial coefficient should be determined by the free choice of the people of the nation, since they are the best judges of whether they prefer to devote the increased power of per capita production arising from improvements in the arts more to shortening their working day than to increasing their rate of consumption, or *vice versa.* Should the industrial coefficient be fixed at one-half it would divide the benefit equally. Assuming such a value for it, a decrease in the average producing time of products thruout the nation of 50 per cent. would mean a decrease in the working hours of 25 per cent., and a rise of real wages of 25 per cent. thruout the nation. The rise in wages would be caused by a fall in the price of commodities as their producing time diminished, without any fall in nominal wages. This, of course, would mean neither more nor less than an increase in the rate of consumption corresponding to the rise in real wages. Without entering here into the technical discussion of the specific means provided by pantocracy for automatically adjusting the wages, prices, and personnel of an industry so as to accomplish this result, it is obvious that the policy we have proposed will attain the end we have been seeking, namely, an identity in the interests of the directing, the wage-earning, and the consuming classes thruout the community. The director will seek to introduce improved machinery and methods into the arts in order to increase his own compensation, the wage earner will employ said machinery with all the skill and zeal with which he is capable in order to shorten his hours of labor, and the consumer will offer no objection to the arrangement,

since as the working day shortens, the prices which he must pay for commodities decrease.

Under competition each man serves his own interests best by rendering society disservice, getting as much from, and giving as little to, society as possible. Under ordinary socialism this antagonism of interest is abolished, but no specific community of interest substituted for it. Under pantocracy each man serves himself best by serving society best—the more he does for society, the more he does for himself, and hence his self-interest as well as his public spirit, his egotism as well as his altruism, urges him to serve, instead of to exploit, his fellow men. Thus while our present system is competitive, and ordinary socialism is *non*-competitive, pantocracy is *anti*-competitive.

(6) The operation of industry under public ownership, involving as it would production on a prodigious scale, under a single directing head or board, would enable each great industry to support, at a cost trifling compared to the total receipts of the industry, one or more large experimental laboratories, the function of which should be the development of improved machinery to be used in decreasing the average producing time of commodities. These should be equipped with the best available appliances, and employ the best technical experts and inventors, and the latter should be stimulated by conditional compensation to exert themselves in producing improvements in the arts, just as the directing class are stimulated by the same means to introduce them advantageously into industry. These laboratories should cooperate with one another in the work of research and invention, and should constitute a great invention producing industry turning out inventions as other industries turn out commodities.

(7) In order to avoid poverty in old age, or when otherwise rendered incapable of production, the government should provide insurance, preferably compulsory, for all adult members of the community. This is a function which the state has already begun to assume in advanced countries. As a means of preventing poverty its effectiveness is so obvious as not to require discussion.

(8) Simultaneously with the reform of the industrial system already outlined, a reform of the educational system should be inaugurated. The two main objects of such a reform should be: (1) To instruct thoroly the youth of the nation in the scientific method of thought, to the end that common sense and not custom shall serve to guide the conduct of mankind. (2) To introduce such tastes, interests, and aspirations among the youth of the nation as shall lead them to adopt habits of simplicity of life and activity of thought, in place of the ostentation of life and atrophy of thought induced by the present system.

Public instruction should be placed on a national, instead of a local, basis, and its deliberate aim should be to stimulate to the utmost those habits of "plain living and high thinking" which, while diminishing the needs of men, increase and simplify their tastes; for the less men's happiness depends upon their environment, the less difficulty will be encountered in adapting their environment to them. I shall not stop to specify the precise character of the educational system suggested, except to say that it should include training in the fine arts and in science, in order that while exercising their faculties in their own interest and for their own entertainment, men shall, at the same time, be contributing to the interest and entertainment of their fellows.

The pantocratic system thus outlined, if adapted to cure poverty, must be adapted to meet the three requirements of prosperity. Let us see if it meets them.

As a means of stimulating the operation of the law of increasing returns, pantocracy is obviously far superior to the present system. By the provision it makes for the elimination of the wastes of competitive distribution, by the incentive it offers all classes of the population to combine their efforts to improve the arts, and by the impetus it gives to the development of machinery thru the organization of invention, pantocracy makes ample provision to meet the first half of the first requirement of prosperity.

This is the strongest point of the present policy, yet its inferiority to the proposed pantocratic policy is so obvious as not to call for comment. How the second half of the first requirement is met will be explained after discussion of the two remaining requirements.

The replacement of private by public ownership of all public utilities, and the abolition of profit, eliminates at once the principal cause of inequality in the distribution of wealth under the present system. The mere ownership of property will no longer carry with it the privilege of levying tribute, as at present, and each man will receive benefit from society strictly in proportion to the service which he renders society. As no means will be provided by which any average family can consume more than it produces, it follows that no average family will be forced to produce more than it consumes, and as a result the average family will be rendered self-sufficient, producing no more and consuming no less than its own share of the world's wealth. Thus pantocracy provides means of meeting the second requirement of prosperity which the present system fails entirely to provide.

A social system which would meet the third requirement of prosperity must do so thru the adoption of an educational policy, which will so influence the habits of the people that vanity and the love of luxury are minimized, and simplicity and the love of inexpensive pleasures are promoted. Not otherwise can the law of increasing needs be offset. As already shown, the policy of pantocracy would accomplish precisely such a result, for the aim of education under that system would be to make men seek happiness less in wealth and luxury, and more in activity, physical and mental, less in the material and more in the mental and moral worlds, less in things and more in thought, to the end that happiness may, so far as possible, become independent of environment, and the law of increasing needs be offset by a habit of increasing tastes. Thus would pantocracy seek to meet the third requirement of prosperity.

What now would be the effect of such a policy on the equilibrium of the population? How would it meet the second half of the first requirement of prosperity? Having stimulated the law of increasing returns to active operation, having rendered the average family self-sufficient, and having nullified the law of increasing needs, what would be the effect on the law of Malthus? Could the population finally be brought to beneficent equilibrium by decrease in the birth rate, or would it, as under the present system, finally attain natural equilibrium thru increase in the death rate? The answer is apparent.

It is everywhere observed that prosperity combined with education tends to diminish the birth rate. Wherever we turn we find that the poor and ignorant breed far faster than the prosperous and educated. Among the latter class, any curtailment of the means of subsistence operates to decrease the birth rate, instead of to increase the death rate, as among the former. In other words, to cure poverty temporarily is to cure it permanently, provided the populace is adequately educated. This constitutes the hope, and the only hope, of posterity. It indicates the only practical mode of escape from the law of Malthus, and the universal poverty inseparable from natural equilibrium. Pantocracy, by providing universal prosperity and employing the law of increasing returns as a means of increasing *the rate of consumption per capita,* would thus suspend the law of Malthus and cure poverty permanently. The present system by providing a strictly local prosperity, and employing the law of increasing returns merely as a means of increasing *the numbers* of an underconsuming population, will not suspend the law of Malthus, and in the end will produce a thousand times the poverty which would have been possible had the world remained uncivilized. In fact, the present system is successful only as a *cause* of poverty. Pantocracy would be successful as a *cure.*

Whatever its faults, pantocracy embodies a definite social mechanism having a definite object in view. Doubtless in working out its details many mechanical difficulties would have to be overcome, as in the case of any other mechanism. These, however, are not important in a discussion of principles like the present. They must be worked out by experiment,

and it is neither possible nor necessary to anticipate them. Indeed, the policy of pantocracy is here submitted to criticism, not as constituting a system possessing either perfection or finality, but as a concrete and common sense plan of political action, presumably adapted to the abolition of poverty, a plan of action to be improved and amended as experience may, from time to time, develop its defects.

BOSTON, MASS.

The New Theater

BY CHARLES HENRY MELTZER

[Our readers will remember Mr. Meltzer's article a few weeks ago "On the Printing of Plays," and that the author is now assistant to Mr. Heinrich Conried, the Director of the Metropolitan Opera House, and the author of several successful plays.—EDITOR.]

WHILE they are talking and dreaming of a National Theater in England, Americans have begun to build one. True, it will be known, when completed, as the "New" —not as the "National" Theater. But the purposes of the projected playhouse will be no less broad for lack of a name which would, perhaps, have been misleading; as the money for building it will be provided, not by a sceptical and reluctant government, but by a group of public spirited and enlightened capitalists.

The formation of the New Theater company or society some time ago caused considerable surprise. For, tho capital had in this country not been wanting for hospitals, libraries, schools, morgues and universities, it had always evaporated at the bare suggestion of an ideal playhouse. Nor was it till ten years of unhampered and unblushing theatrical commercialism had discouraged self-respecting New York playgoers that the idea of founding an American equivalent of the Théâtre-Français or the Burgtheater took definite shape.

Like other men with brains, Mr. Heinrich Conried, director of the Metropolitan Opera House, had long hoped to be the promotor, and, perhaps, manager, of a theater in which literature, drama and the art of acting should find free and full expression here, regardless of the cus-

THE NEW THEATER IN PERSPECTIVE FROM THE ARCHITECTS' DRAWING.

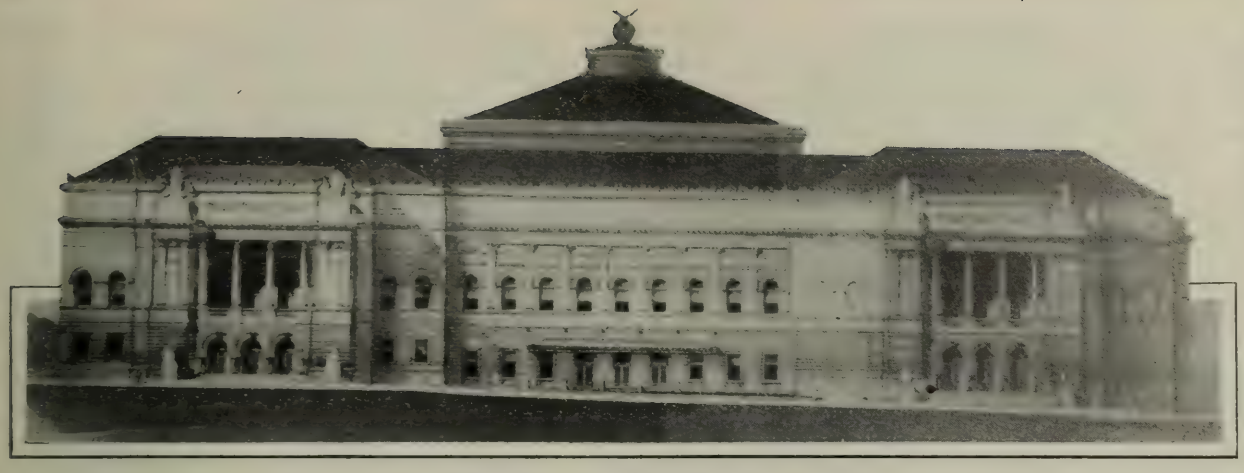
tomary financial drawbacks. About a year ago he made a commotion by announcing that he had persuaded thirty wealthy gentlemen to supply funds for the organization and endowment of a National Theater which would be built between West Sixty-second and Sixty-third streets, facing Central Park. The premature disclosure of the plan led to its abandonment. But it had the effect of calling the attention of many millionaires and a few multi-millionaires to the existence of a social need fully as serious as that which had led to the erection of the Metropolitan Opera House. Among them were great bankers, powerful railway kings, capitalists interested in real estate, leaders of fashion, well-to-do painters, architects and men of letters. All had traveled and therefore had had occasion to convince themselves of the artistic and educational possibilities of drama. After an informal talk or two, some of these gentlemen (notably Mr. Charles T. Barney, Mr. Otto H. Kahn, Mr. John Jacob Astor and Mr. Eliot Gregory) became actively interested in the idea, altho not actually in the scheme, which Mr. Conried had formulated. Thru their influence and enthusiasm various others became interested. At last it was possible to announce that a playhouse, so liberally supplied with funds as to be virtually indifferent to commercial consideration, would be founded here (on the site originally selected) with the active and material support of forty-five stockholders, each pledged to subscribe $25,000 for the privilege of owning a private box in the theater twice a week in perpetuity, and each believed to be willing, if occasion arose, to meet any imaginable deficiency in the treasury.

The founders of the New Theater whose names have been published are:

John Jacob Astor, Charles T. Barney, Edmund L. Baylies, August Belmont, Robert B. Van Cortlandt, Paul D. Cravath, William B. Osgood Field, George J. Gould, Eliot Gregory, James H. Hyde, Otto H. Kahn, W. De Lancey Kountze, J. Pierpont Morgan, James Henry Smith, James Stillman, Hamilton McK. Twombly, William K. Vanderbilt, Cornelius Vanderbilt, Henry Walters, Henry Rogers Winthrop, Harry Payne Whitney.

Mr. Heinrich Conried will be Administrator-General—or acting director—of the theater.

The chief purposes of the New Theater, as they have been explained to the writer by some of the founders and by the Administrator-General, are to promote the best interests of the stage, and to improve the public taste, by the organization of a permanent company of trained actors, who will interpret (in English) the best standard plays in the dramatic literature of the world, and, from time to time, will appear in new works by American and foreign authors. The founders (and Mr. Conried) are convinced that the stimulating example set by the New Theater will rapidly develop the unquestionable talent of American dramatists, help to reform acting, and result in the creation of a dignified and admirable American drama.



Another and less important, but excellent, object of the New Theater is to foster the dainty and delicate form of opera known in France as opéra comique. Technically, of course, by opéra comique the French mean opera with spoken dialog. But the significance of the term may here be broadened so as to include many grand operas (or serious operas with recitative), which are heard to most advantage in theaters less vast than the Metropolitan Opera House. Operatic performances will probably be given during each season once a week.

As an earnest of the generous and yet reasonable way in which the projected institution will be conducted, it may be mentioned that about two million dollars will be spent on the mere building, which will be an art monument as well as a playhouse; and that all profits that may accrue to the founders over and above 5 per cent. will be devoted to the improvement and support of the theater, and possibly to the formation of a pension fund for the actors in the company. Three-quarters of a million have been spent on the site secured for the building.

Designs for the New Theater were submitted by the ten leading firms of architects in America. The one finally chosen was sent in by Messrs. Carrere & Hastings.

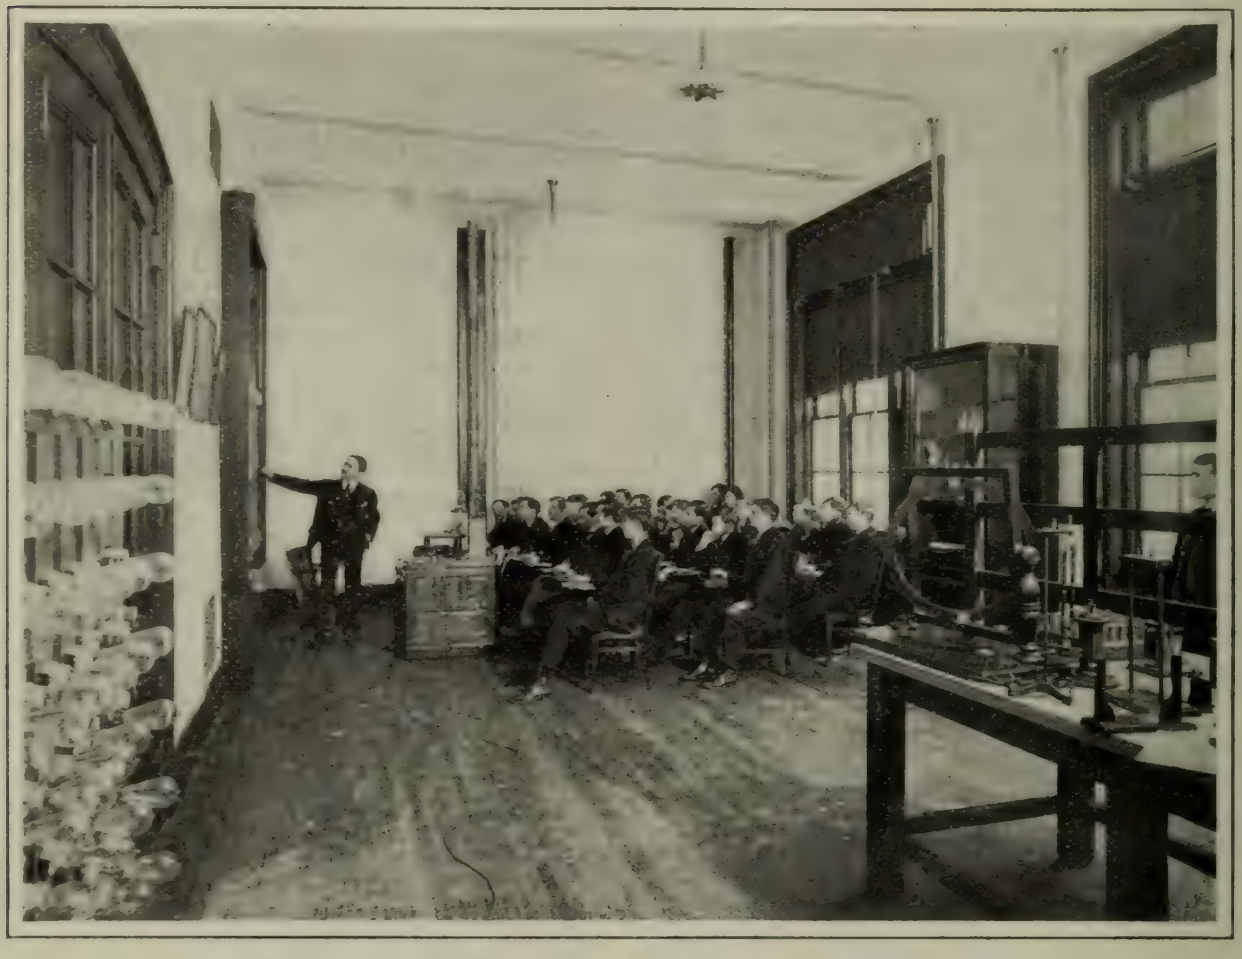
All being well, the New Theater will be opened early in October, 1908, possibly with a new American play.

New York City.

THE NEW CARNEGIE INSTITUTE.

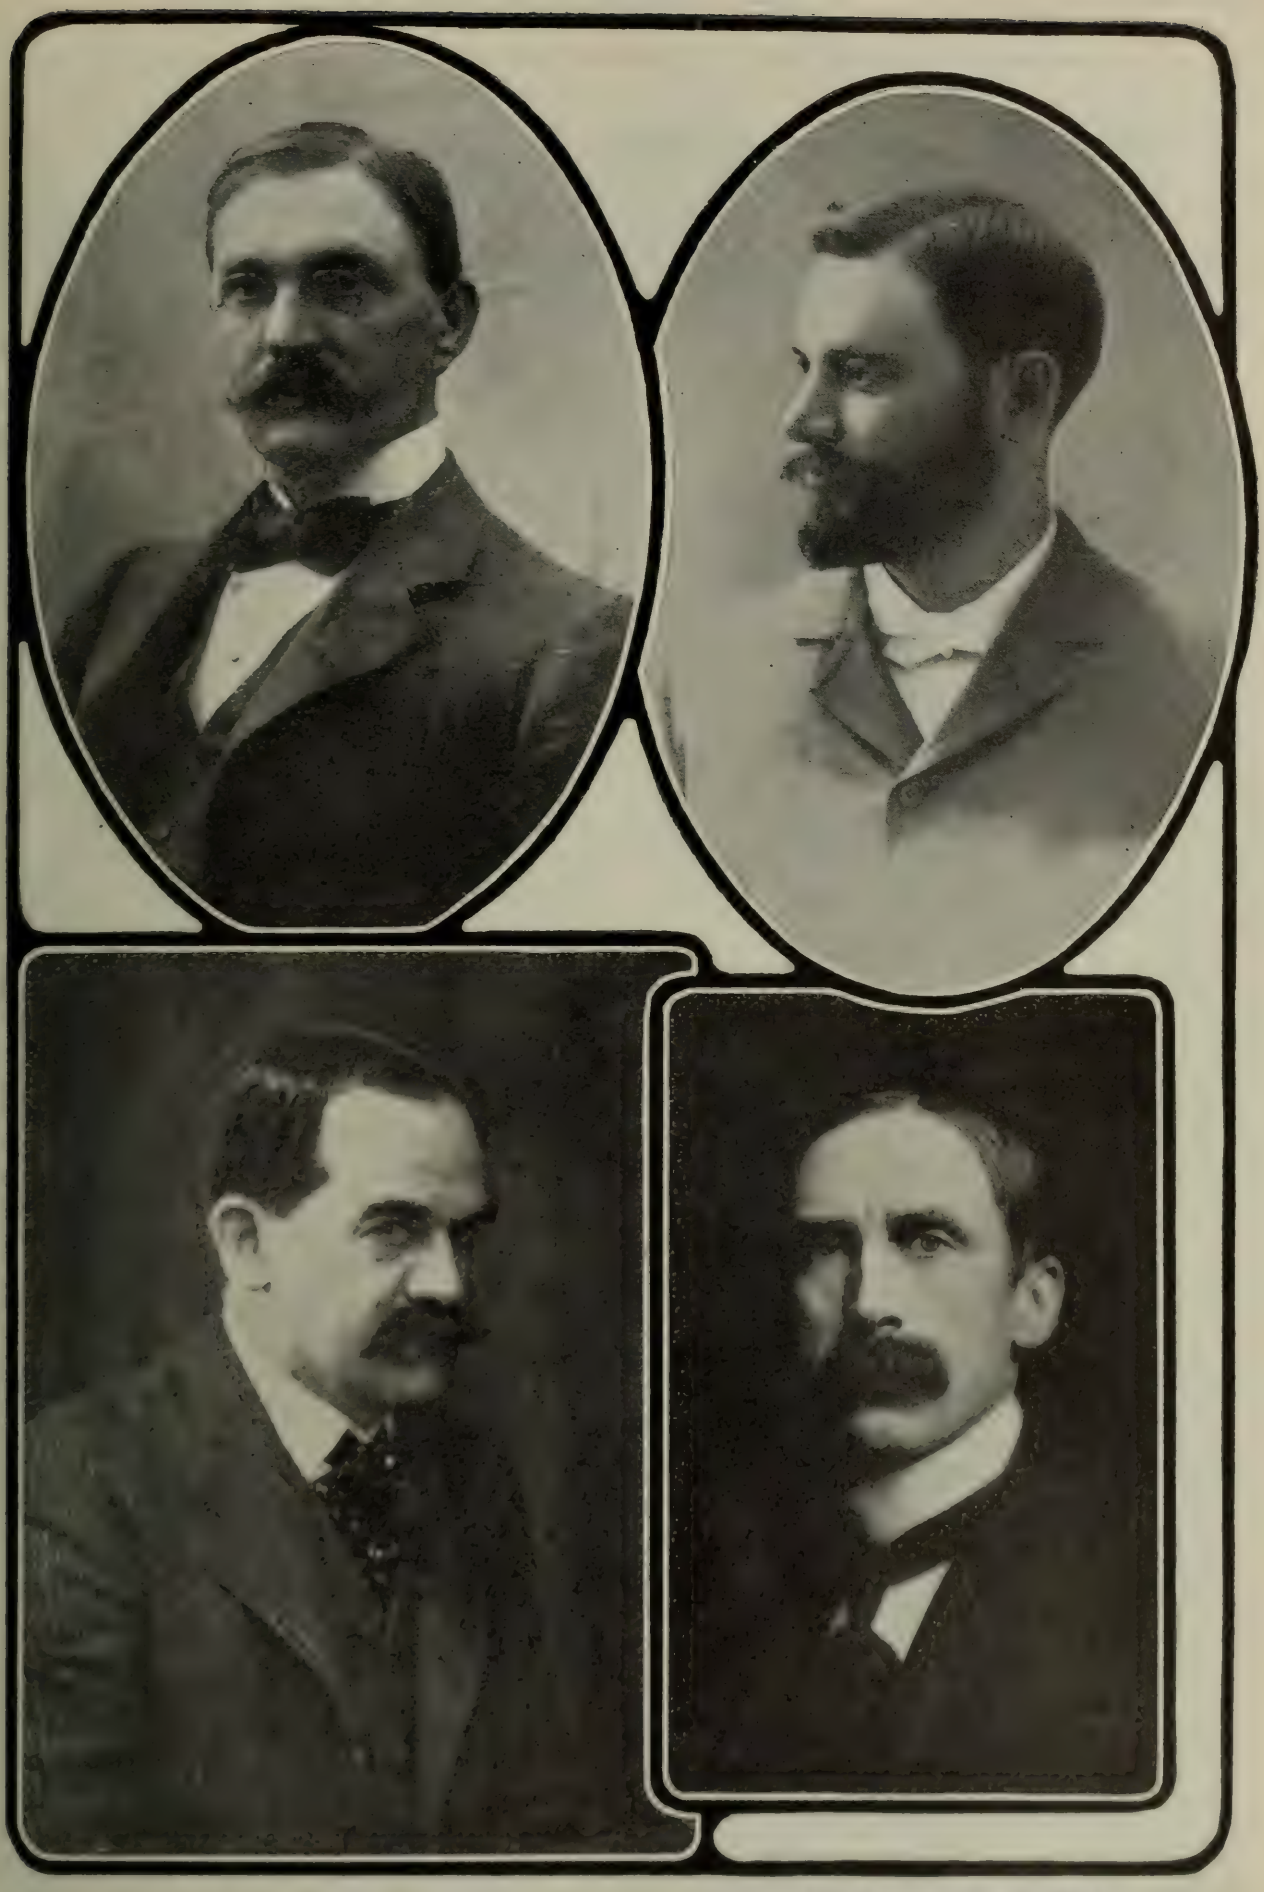
The Carnegie Institute at Pittsburg

BY PAUL HARDEN



[The opening of the Carnegie Institute at Pittsburg next April promises to be one of the most notable functions ever held in the United States. Many of the world's greatest men are expected to be present. We are glad to be able to give our readers the following interesting survey of its objects and equipment, from the pen of a member of the staff of the Institute.—EDITOR.]

PITTSBURG has now become the fifth city in population in America and stands first as a manufacturing and industrial community, for its share is more than one-half of the whole production in the United States of steel, coke, iron, plate glass, glassware, harness leather and iron pipe, and it has twenty-five hundred mills and factories with an annual production worth $250,000,000 and a payroll of $75,000,000. Four hundred passenger trains and 6,000 loaded freight cars run to and from its terminals every day. Its armor sheathes our battleships as well as those of Russia and Japan. The city equips some of the navies of the world with projectiles and range-finders. Its bridges span the rivers of India, Egypt, China, Chile and the Argentine Republic; and its locomotives, rails and bridges are used on the Siberian Railway. It builds electric railways for England and Brazil, and telescopes for Germany and Denmark. Nowhere else in the world are there such large plants for steel, glass, air-brakes, steel rails, corks, iron tubes and steel freight cars.



But while these industries have given Pittsburg wealth, population, supremacy and power, commercial materialism is not the "Ultima Thule" of the people. In the past ten years the advance in the higher life has been as extraordinary as the progressive industrial development. In that time the city has extended its corporate boundaries by the agency of rapid transit into an entirely new residential district containing thousands of beautiful homes, with churches and schoolhouses in nearly every block. Two great parks, one the gift of Mrs. Mary Schenley, embracing four hundred acres in the very heart of the city, the other purchased by the city corporation, have been developed at a generous annual cost. It maintains by popular subscription one of the three great symphony orchestras in America, and has given enduring names to science, literature and art. Its astronomical observatory is known thruout the world, and its university, now more than one hundred years old, is growing in educational power. But the greatest agency in the intellectual development is indisputably recognized to be the Carnegie Institute, with its ten thousand visitors every day. The new building of the Carnegie Institute now stands among the world's great pieces of architecture—a torch of light held out over the community to bring some degree of illumination to every human brain.

Ten years ago Mr. Andrew Carnegie founded the institution named after him in the city of Pittsburg. His original purpose was to employ the institute as a medium for disseminating information among the people by the circulation of books—in short, the institute was to be limited to the activities of a public library, built by him and supported by the city. In a short time, by means of the central organization and its branches judiciously located in various parts of the city, the people of Pittsburg were afforded a broad opportunity for mental culture thru the many and diversified books thus provided. Wishing to elaborate the scope and usefulness of the institute, Mr. Carnegie, on the night when the building was first opened to the public, placed in the hands of the trustees the sum of $1,000,000, with instructions that the income should be used to establish in connection with the library a department of fine arts, a museum of natural history and a school of music, all of which should be available to the public without charge.

It would be difficult to give a comprehensive idea of the benefits that have already resulted from this enlargement of the purpose and scope of the institute. Perhaps the best indication of the appreciation of Mr. Carnegie's generosity was the interest manifested in the several departments, resulting in an attendance of 500,000 persons annually. With its generous endowment the institute developed so rapidly that the trustees found themselves unable either to find space for the many objects of artistic and scientific interest, or to accommodate the many who desired to avail themselves of the opportunities for culture thus presented. The situation was explained to the founder, who directed that the original building should be dismantled and a new and greatly enlarged structure erected at a total cost of $6,000,000. Thus means were provided for a center of learning which can well be called one

THE PRESENT TECHNICAL SCHOOLS.

of the most notable not only in America, but in the world, for the building which will be dedicated in April next is worthy to be dignified by this distinction, since it is not only a masterpiece of architectural design, but of such imposing dimensions that it has few equals in size. Situated in Schenley Park, one of the city's most attractive pleasure grounds, the new building is no less than 400 feet in length and extends 600 feet in the rear, giving ample space for the various departments which are to be housed under its roof.

The Carnegie Institute now comprises five great departments—the Library, the Museum, the Art Gallery and the Music Hall, also the newly created Technical Schools. The library has a total collection of about 250,000 volumes, and even under the restricted conditions of building operations, which have hampered its administration during the past two or three years, it circulated 584,000 of these volumes among the people during the past year, and had an attendance in its various reading rooms aggregating 385,000, which is less than normal. It has a children's department, thru which fifty-four schools were supplied with all the books that were called for, while thirty-four home library clubs and thirty-five reading clubs were conducted under the auspices of the library, chiefly among the poorer children of the city. It has 153 agencies in the city of Pittsburg for the free distribution of its books. For five years it has maintained a school for children's librarians which is devoted exclusively to training young women for library work for the children. Students come to this department from various parts of our country, many of them being graduates of our best colleges. The demand for trained children's librarians is very great, and this work offers a new professional field for women with active and ambitious minds.

The museum, already ranking as one of the four great museums of America, has had an exceedingly successful and well-proportioned growth. A purpose of scientific research has led it to send various exploring expeditions into different parts of the country, especially into the great Middle West, where rich discoveries have been made in the field of paleontology, enlarging the boundaries of human knowledge. The diplodocus, a monster 84 feet long, the most prominent example of this research, will be seen in the great Hall of Dinosaurs, in the new building, surrounded by many other specimens of extinct animal life which inhabited the earth before the time of man.

The museum has a collection of 25,000 birds. In its department of entomology it has over a million specimens, more than 100,000 insects having been carefully mounted and classified during the past year. Its botanical collections are large and valuable. Its departments of mineralogy, zoölogy, ethnology, numismatics, ceramics, textiles, the graphic arts and historical objects are most interesting and instructive. In its section of transportation it presents a series of beautiful models, showing the method of carrying men and materials from the earliest times down to the present days of palatial trains and steamers.

In the art gallery there is held every year an international exhibition showing the best paintings of the world. The mark of authority is placed upon the merits of these exhibits thru a system which is peculiar to this institution. When these exhibitions were first

planned the great question was: How shall we show to the world that the pictures accepted here are really worthy of regard, and that our prizes awarded in connection therewith are based upon a proper knowledge of painting? It was then decided that each painter of reputation who sent a picture to the Carnegie Institute for exhibition should be entitled to vote for eleven painters selected by himself from the entire body of artists thruout the world, and the eleven men receiving the highest number of such votes should be constituted a jury. This system brings annually to Pittsburg the greatest painters of Europe and America, who meet on a common ground and view all paintings, saying which shall be accepted and which rejected, and afterward what awards shall be made. The fairness, impartiality and authority of this system have long been accepted by the world of painters. The advisory committees who have passed upon all pictures coming into Pittsburg from Europe comprise names which are known as of the highest merit, among them being Edwin A. Abbey, Sir Lawrence Alma-Tadema, Luke Fildes, John Lavery, F. D. Millet, W. Q. Orchardson, John Singer Sargent, J. J. Shannon, John M. Swan, E. A. Walton, Edmond Aman-Jean, P. A. J. Dagnan-Bouveret, Miss Mary Cassatt, Charles Cottet, Walter Gay, Leon Augustin Lhermitte, J. Gari Melchers, Charles Sprague Pearce, Jean François Raffaelli, Fritz Thaulow, Ludwig von Loefftz, Carl Marr, Toby E. Rosenthal, Franz Stuck, B. J. Blommers, G. H. Breitner and H. W. Mesdag.

Among the painters from Europe who have come to Pittsburg to serve on these juries have been Robert W. Allan, Edmond Aman-Jean, Charles Cottet, Alfred East, Alexander Harrison, John Lavery, Jean François Raffaelli, Alexander Roche, John M. Swan, Fritz Thaulow and Anders L. Zorn. It is expected that the exhibition to be held at the time of the dedication of the new Carnegie Institute will be distinguished in range and value beyond previous exhibitions. In addition to the attractions of the art gallery, arrangements have been made for the installation of a representative collection of casts, illustrating the most important works of sculpture and architecture during all time.

When the new building is dedicated, the new technical schools will not be quite two years old. Built on a site consisting of 32 acres, which was donated by the city of Pittsburg, these schools are rapidly growing in number and power, and are now furnishing instruction to nearly one thousand pupils in the day and night classes. Nearly ten thousand young men and young women have

THE TECHNICAL SCHOOLS AS THEY WILL APPEAR WHEN COMPLETED.

already applied for entrance to these schools, and it is hoped that in the future accommodation may be provided for all who thus thirst at the fountain of knowledge. As this enormous registration gives some indication of the public interest in technical education, it seems only proper to offer a very brief description of these schools for the further enlightenment of those who care to read them.

The Carnegie Technical Schools embrace four distinct organic divisions, of instruction for the further education of apprentices already at work at their trade, who will receive, at night or at such other times as can be suitably arranged, the technical and theoretical information which will prepare them for advancement to the ranks of skilled mechanics. After that is the school of applied design, which offers courses of instruction to classes in technical design and mechanical processes of the various art industries. And last is the technical

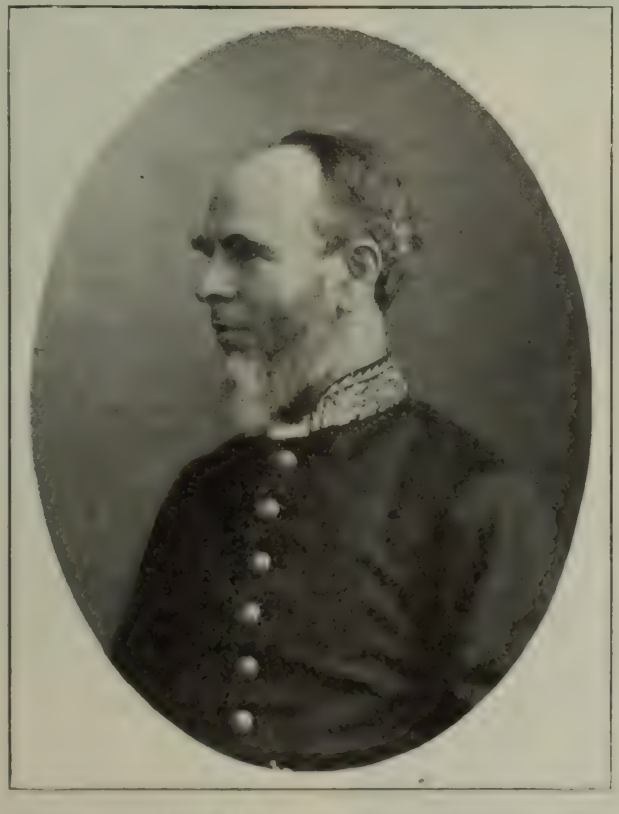
EVENING IN A STUDIO.
Painting by Lucien Simon. Awarded Carnegie Institute Medal of the first class (gold) with money prize of $1,500, at the tenth annual exhibition, 1905.

which together form a comprehensive system of technical education. First is the school of applied science, which has been designed to administer to the needs of young men of sixteen years of age who desire a thoro preparation for some specialized vocation, such as architectural, civil, chemical, railroad motive power, foundry, electrical and mechanical practice.

Then there is the school of apprentices and journeymen, which offers a course

school for women, which has for its particular aim the training of women in many ways to earn their livelihood.

The ceremonies by which this truly magnificent creation for universal education will be dedicated will be appropriate to such an auspicious occasion. It is hoped that the President of the United States and the members of his Cabinet, the justices of the Supreme Court, members of Congress and the diplomatic representatives of other na-

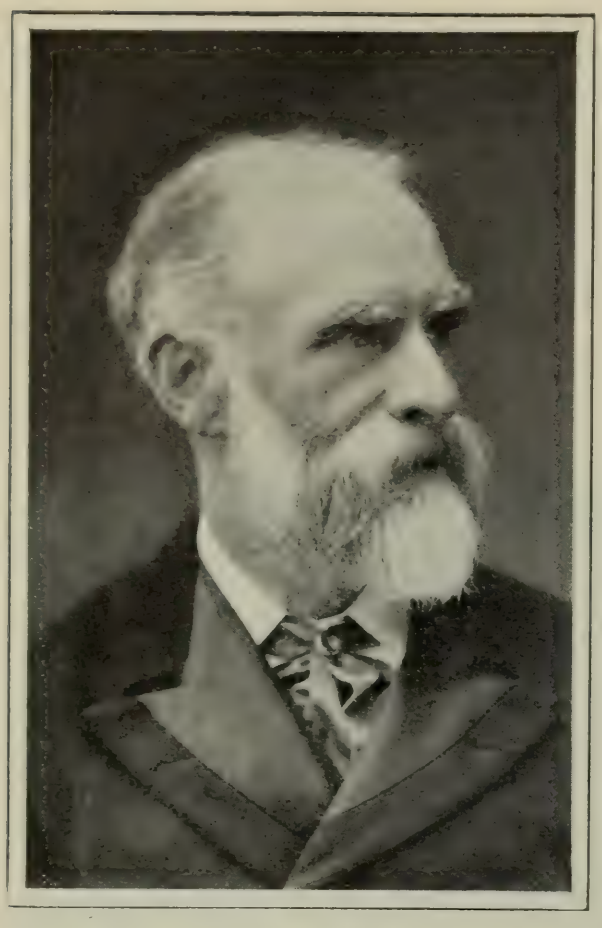


tions will be among the guests, as well as many other American citizens who have won distinction in various fields of work. Recognizing the significance of the event, many men and women noted for achievements in art, science, literature and statesmanship will attend the ceremonies, including leaders of the world movement for universal peace. The program of exercises will embrace addresses by the founder and words of congratulation from similar institutions in other countries, many of which will be represented. It will include discussions of topics of moment by authorities on the several subjects and the entertainment of guests in a suitable manner.

PITTSBURG, PA.

The Lords and Commons

BY JUSTIN McCARTHY



THAT region of London in which Westminster Palace is the most prominent object has been, during many recent nights, presenting an unwonted aspect for this period of the year. Each night and sometimes thruout the whole night the windows of the Houses of Parliament are blazing with light. The House of Commons has suddenly gone back to its old ways and has been holding several all-night sittings, just as it used to do when Charles Stewart Parnell was leading his Irish National followers in their brave work of obstruction to the policy of an unsympathetic majority. This time the battle is not so much between a majority and a minority in the representative chamber as between the House of Lords and the House of Commons. I cannot recall to memory any such conflict between the hereditary chamber and the representative chamber during my time—any conflict, that is to say, so direct and so obviously calculated to bring about a new epoch in the parliamentary history of England.

LEONARD COURTNEY.

The main question involved in this dispute is the measure of public education brought in by the Liberal Government. The measure was carried thru the House of Commons after a long stretch of debate by a large majority, and we have lately learned that that majority would have been much larger if the Irish National party had been fully assured in time of the concessions to their requirements which the leaders of the administration had resolved to make. Then the measure passed on to the House of Lords and the Lords went to work and converted it into something entirely different from that which the Government had made it, and, in fact, transformed some of its most important provisions into legislation the very opposite to that which its promoters had created.

The House of Lords is Conservative in its great majority, and also has among its

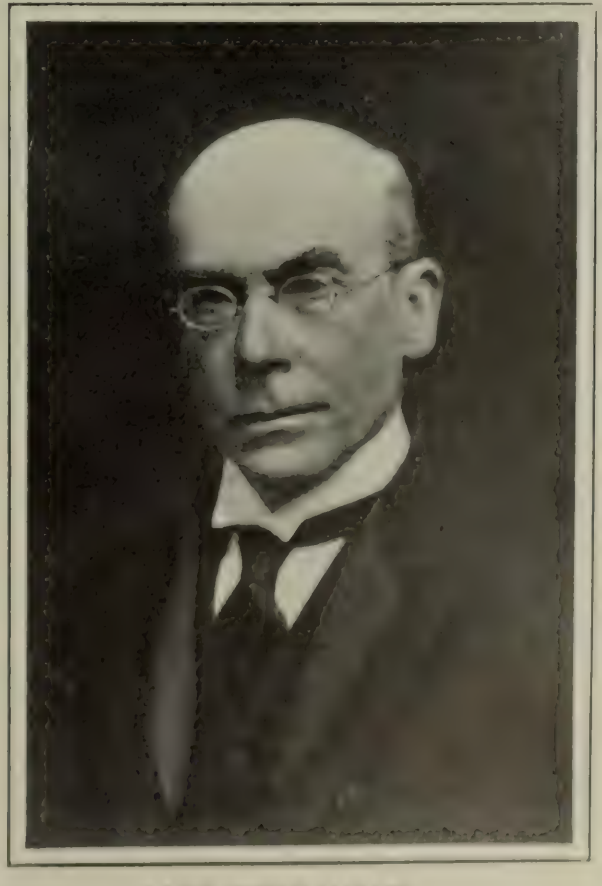
JAMES BRYCE.

members the prelates of the Established Church of England, who are, with very few exceptions, inflexibly opposed to the Liberal cause and to all projects of popular reform. Almost every great Liberal measure adopted during recent history by the House of Commons has been rejected in the first instance by the House of Lords. But when a measure is one of genuine national importance, the House of Commons brings it on a second time, passes it again by a great majority, and sends it once more to the House of Lords, and then in almost all instances the House of Lords makes up its mind that it has done enough in the way of what Thomas Carlyle calls "arguing with the inexorable," and quietly altho reluctantly and grumblingly allows it to receive the royal assent and pass into law. In the present instance, however, the House of Lords is understood to have made up what it calls its mind not to make any such submission, and this is evidenced by the fact that it has sent back to the House of Commons a measure utterly unlike that which it received from the representative chamber. Sir Henry Campbell-Bannerman and his colleagues in the Government determined not to deal with the altered measure at all, but to stand by the bill as it originally passed thru the House of Commons, and to shape their future course according to the action which the Peers may resolve to take. If the Lords should persevere in their resistance, as the impression everywhere is that they

MRS. BRYCE.

will do, then will come a crisis which cannot but effect the very existence of the House of hereditary legislators. The ordinary course taken in such a case would be for the Government, with the sanction of the King, to create a number of new Liberal peers, and with this display of power to make it clear to the majority of the peers that they had better give in, lest worse befall. But then, the majority in the House of Lords against the Education Bill as sent up to them was so large that it would be hardly possible for the Government to create a number of new peers so great as to change the whole character of the House. On the other hand there is not, I should think, the slightest probability that the Liberal Government would appeal to the country by means of a general election,

and thus obtain a national declaration in favor of its educational policy. The majority which the Government holds already in the House of Commons is absolutely overwhelming, and it would hardly be worth while to put the constituencies to the trouble and cost of another general election so soon, when the only result could be to give to it some such number of supporters as it already has in the House of Commons. But whatever may be the course taken, it is quite certain that we have arrived at a crisis which must open a new chapter in our constitutional history.



Of course it must not be supposed that there are not in the House of Lords

LORD WEARDALE.

already a considerable number of intellectual, enlightened and progressive men who are steadfast in their Liberal and expansive principles. Quite recently they have succeeded or been added to the peerage several such men. Leonard Henry Courtney, now Lord Courtney, was for many years distinguished as a journalist, a professor of political economy, and after his election to the House of Commons held ministerial office more than once. Lord Fitzmaurice, who had a distinguished career as Lord Edmond Fitzmaurice in the House of Commons, being then only the younger son of a noble family, is a most enlightened and most capable man, and Philip Stanhope, now Lord Weardale, is and always has been a thoroly advanced Liberal in his political opinions. But the majority in the hereditary chamber are still so overwhelmingly Conservative that unless the Government were to venture on an entirely unprecedented stroke, a sort of *coup d'état* in fact, it would not be possible to create an army of new peers strong enough to bear down the force of the anti-progressive nobles. The certainty is, as it seems to me, that the Government will send back the Education bill in its original form to the House of Lords and wait for the effect which must be wrought on the public feeling of the country, and may convince even the House of Lords that its existing constitution must undergo some fundamental change and give the Liberal Government time to consider what the nature of that change ought to be.

The Lords have been obstructing the

LORD FITZMAURICE.

work of the Commons in other fields as well as in that of education. They have just rejected altogether the measure passed thru the House of Commons for abolishing the plurality of votes. Under our present constitutional arrangements any man who possesses a distinct qualification as a voter in several different counties or towns may give his vote in all these different places and may thus contribute directly to the election of several different candidates for seats in the House of Commons. Anything more unreasonable or unfair than this condition of things it seems to me difficult indeed to imagine. It makes a law absolutely favorable to the rich and more favorable to the rich man in proportion to the amount of his wealth. Among the whole mass of the poorer electors and even among the great majority of the lower middle-class electors each voter has but one place of residence and therefore one qualification. Of course among the wealthier orders of the community most men have a town residence, a country residence, a shooting-box, as it is called, a place by some river side where fishing can be enjoyed, and each of these owners can have a vote for each of his abodes. It is obvious that if a rich man is anxious to extend his influence over the Parliamentary elections he has only to set up a number of new residences in different parts of the country and to multiply accordingly his votes at every General Election. If ever, therefore, there could be a condition of things which enacted one law for the rich and another for the poor it is this arrangement which the Liberal statesmen in office are now endeavoring to abolish. The measure for this purpose was passed by a great majority in the House of Commons and sent up to the House of Lords, and there it was at once rejected. If anything were needed to give further stimulus to the Liberal resolve for some effective dealing with the present constitution of the House of Lords the rejection of the measure for the abolition of plural votes must bring about that end. When the Lords interfere with the Commons to prevent a reform in the conditions belonging to the representative chamber alone it is surely about time that the Commons should take some decided steps to put reasonable limits on the aggressive enterprises of the Peers.

I have much pleasure in bespeaking the attention of my Irish readers, and indeed of all readers in the United States, to a charming volume which has just made its appearance here. It is called "The Fair Hills of Ireland," is published by Messrs. Macmillan of London, and is the work of Stephen Gwynn, who has lately been elected a member of the House of Commons. If I might thus put it he presents to us a most interesting and beautiful picture, and then he proves to us that the picture is literally a photograph, a reproduction of what once was reality. The book is delightful reading in itself, even if we take it only as a traveler's description of the beautiful places he has looked upon in several parts of Ireland. It would be welcome even as a mere description of a holiday tour, and it certainly cannot be any the less welcome to the intelligent reader because it brings up to the modern mind the actual realities of a marvelous epoch in Ireland's history when Ireland had but her own national memories, national hopes and national sympathies to guide her in the work of national development.

A novel which has attracted much interest here has just been published by Mr. Fisher Unwin. It is by the late Mrs. Hugh Chesson (Nora Hopper), and is called "Father Felix's Chronicles." Father Felix is a Benedictine monk of the fifteenth century, and he tells in these chronicles the strange and stirring events of his day. Mrs. Chesson seems to have realized in a wonderful manner the spirit of the "olden time" of which she writes. The book is prefaced by an introduction written by her husband. I hope to say more of it in my next letter and also of Mr. Percy White's last novel.

London, England.

The Rich Young Ruler

BY ZITELLA COCKE

Dear friends, come nearer, for I cannot speak
As I was wont to do, when in the courts
Of great Jerusalem I sat and spake
So long ago, as ruler of the Jews.
Ah, yes, it must be long—aye, long ago—
For I was young and strong, and trod the ways
Of men with quick and eager feet, and oft
Made joyful haste to where the solemn chant
Of David's Psalms made music to my soul—
The temple of the Ever Living God!

Methinks I see once more her glorious walls,
Her golden censers and her incense sweet,
That mingled with her people's glowing prayers.
My steps are heavy now—Jehovah's House
Razed to the ground by cruel, heathen hands,
Her sacred altar low, her glory gone!
Can I forget thee, O Jerusalem?
Nay, nay, let my right hand her cunning lose,
My tongue be mute, mine eyes be closed in death,
Ere I forget the City of our King,
The joy of the whole earth!

Throw open wide
The window! See how tenderly the light
Of evening plays upon Judea's hills.
No shining temple from her glittering hights
Gives back the sun his glorious radiance;
And yet his lingering rays seem loth to leave
The cherished, hallowed spot he once so loved.
My friends, read to me from the Sacred Scroll,
The Law, on which I loved to meditate
Both day and night, and kept from my first youth
Unto this day. Alas! alas! my youth,
When men did call me good, and aye did love
To sound my praises in mine ear, which I
Did love too well to hear, nor did I know
How much I lacked to win eternal life.

But there came One who looked down in my heart
And read the deep, mysterious characters
That burned upon its inmost core. The time
When I came running, kneeling at His feet,
His look of love, that stirred the very depths
Of my proud soul, is with me now. The day
Was calm and beautiful; the springing earth
Smiled like a Paradise beneath the blue
Of heaven; the fragrant air breathed harmony
And sweetest peace, and looking up I saw
The Master! In His arms a little child,
Which, with a tenderness unspeakable,
He blest. O what a matchless picture there!
Divine compassion, childhood's innocence!

I followed in the way and kneeling asked
His blessing. "What, good Master, shall I do
To gain eternal life? The Holy Law
Have I observed from my youth up." And straight
He gazed upon me with a look of love
That seemed to flow from the great Heart of God,
And I was fain to follow at His side.
When lo! He spake, and my poor pride was grieved,
For He, with Godlike ken, had touched the thing
Of sin, the serpent self, whose poisonous fangs
Till then lurked in their secret hiding place:
"Sell all thou hast and give it to the poor.
Take up the Cross!" Not so did Moses teach.
My stubborn heart was grieved, and I forsook
His path. O bitter thought! How oft I felt
Like some deserted soul God had cast off!

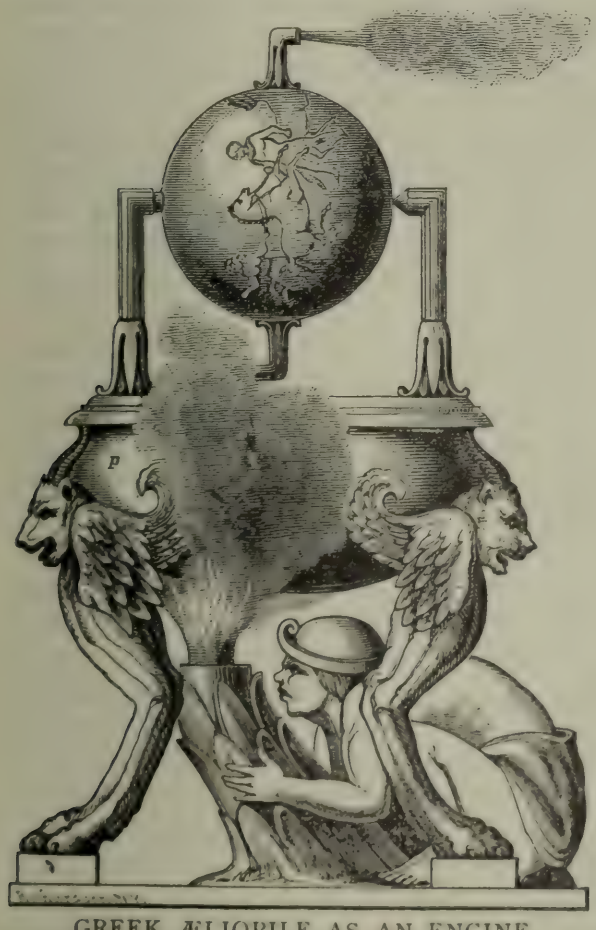
Yet in the sunny haunts of memory
That look divine, of love ineffable,
Remained my dream, my joy—the hope that I
With trembling hand hugged to my aching heart.
A little while, and in the Judgment Hall,
Where sat the Roman Pilate, I beheld
Unsullied Purity arraigned before
The changing justice of a human bar!
At Golgotha I saw Him crucified.
The Sacrifice! The Holy Lamb of God!
And then, ah then, I saw the Promised Hope
Of Israel, of whom the Prophets wrote—
Him who should save His people from their sins.
And the fast doors of my stout heart gave way
And I believed and trusted as a child,
No longer ruler of the Jews, but one
Who loved his risen Lord—Saint Barnabas.

Mine hours are numbered, say ye? They must be,
For my dull ears are wakening to the strain
Of heavenly harps, and my worn eyes behold
The smile of welcome on the Master's face.
'Tis growing dark, dear friends—the sun is gone—
But I shall see the Sun of Righteousness,
My soul be filled with light, my heart with bliss.
I shall not feel the weariness of years
Within the Gates of New Jerusalem!

Boston, Mass.

A Cycle in Steam Engineering

BY JAMES C. BAYLES, M. E., Ph.D.



THE archaic symbol of the serpent swallowing its tail has been employed to typify different things at different times. For those curiously inclined, it might be interesting to speculate how far this process of self deglutition might be carried and what would be its ultimate result; but no useful purpose would be served at the moment by such an inquiry. As typifying the cycle in steam engineering which has brought us back practically to the starting point and promises to leave us there, it is perhaps the best which could be employed. It tells the story.

It is usual to think and speak of the steam engine as something relatively new, and to classify it as belonging chiefly in the nineteenth century. As a matter of fact, it is older than anything we can compare it with. The expansive force of the highly heated vapor of water and its convenience as a means of converting thermo-dynamic potentiality into kinetic energy, were probably well known to the priests long before the beginnings of written history. It was a convenient means for working miracles; hence the knowledge of its properties and applications was first among the mysteries sacred to the priestly cult. Steam would move things at a distance from the source of power, in ways deemed very wonderful by the superstitious and credulous. For example, by its agency gates were made to open and close without the aid of human hands; statues and idols were caused to move impressively or to give forth sounds, as in the case of the Egyptian Memnon, which saluted the rising sun with vocal welcome; altars were at will enveloped in scalding clouds, to the undoing of those who sacrilegiously approached them; strange and terrifying noises were produced, and other surprising things done. The mechanical devices by which these results were effected were extremely crude and simple, but they served their purpose. For what we know about such employments of steam we are chiefly indebted to Heron, a mathematician and mechanician of Alexandria, who lived in the fourth century B. C.

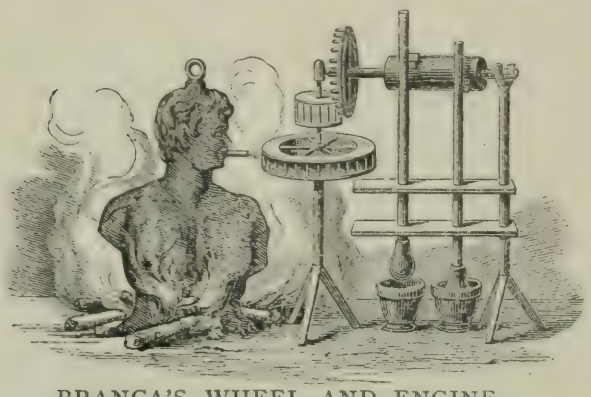
Concerning Heron, the conclusion may safely be reached that, if not entitled to rank with the great philosophers of antiquity, he was at least a very clever, amusing and courageous person. He certainly had a sense of humor. In some way he found means of acquiring the knowledge which the priests guarded so carefully. Perhaps this was not difficult, as there is reason to believe that he was brought up in the temple service. In later life he seems to have found it a pleasure, and perhaps recognized it as a duty, to expose the rank impostures of the priests, long distrusted by the more intelligent classes, but tolerated as a means of holding the common people in subjection. Heron wrote several books, some of which probably perished in the destruction of the Alexandrian library. Of those which survived the vicissitudes of centuries, his "Spiritalia seu Pneumatica" is the most interesting. Its clear purpose was to expose the frauds practiced by the priests in the Egyptian temples, who were famous miracle-mongers. To have done this by modern methods of direct attack and denunciation might have been dangerous, so Heron assumed the character of a wise and well instructed priest of Isis, who had undertaken to initiate an acolyte into the mysteries of the temple. That he derived great enjoyment from showing how easy it is to work miracles, if one knows how and has the apparatus, is evident.

Among the devices of great antiquity described by Heron is the æliopile. It is as old as the bronze age. In its simplest form it is a hollow vessel, approximately spherical in shape, with a small opening thru which water is charged into its interior, and from which, when heated by external firing and the water evaporated, steam escapes from the spout of a tea-kettle. These little boilers were made of all sizes and shapes and were employed for a variety of purposes. One form, described and illustrated by Heron in "Spir-

italia," is an enclosed boiler, from the top of which hollow uprights are carried. Between these is suspended a hollow sphere or hollow trunnions, provided with two outlet tubes perpendicular to its axis, with ends turned in opposite directions. When the boiler was filled with water and a fire made under it, steam was generated. This steam, finding escape by the hollow uprights, and into the sphere by its hollow trunnions, was exhausted thru the tubes attached to its equatorial periphery. The resistance of the air to the escaping steam caused a recoil, which set the sphere in energetic revolution.

GREEK ÆLIOPILE AS AN ENGINE.

This, so far as written history shows, is the first application of steam to produce rotation. Its age is wholly conjectural. There is no reason to regard it as an invention of Heron's. Probably the æliopile, in one form or another, is as old as priestcraft, and was as useful in the Chaldean and Phœnician temples of Astaroth as at the Egyptian shrines of Isis. It may be mentioned in passing that Heron recorded a great many other things which modern ingenuity has reinvented and patented, among them the nickel-in-the-slot machine, the prepayment gas meter and their variants. They were all anticipated in the lustral vase, from which, when the thirsty gallant of Alexandria or Thebes dropped into its contracted mouth his uten or other coin of the requisite value and held his goblet under the spigot, a measured stream of wine issued.



Between Heron's time and that of the first of the mechanicians to employ steam as a motive force, there appears to have been a long interval. Doubtless this is rather apparent than real. It is explained by the hiatus in written history. Probably there never was a time when the philosopher and mechanician were not doing something in steam, with a more or less intelligent perception of its possibilities as a useful force if brought under control. Solomon de Caus, Blasco de Garay, the Marquis of Worcester, Lord Bacon, Denys Papin and a dozen others move across the stage in a hazy and uncertain way, and for each has been claimed the honor of inventing the steam engine, but they are best remembered for what they hoped for and promised, but somehow failed fully to perform. They were all men of

"Large desires with most uncertain issues."

Some two thousand years after Heron published his "Spiritalia," Giovani Branca, a Florentine, published in 1629 his book, "The Machine," in which he described and illustrated an application of the æliopile to rotate something very like a modern hydraulic turbine. His æliopile, made in the shape of the bust and head of a human figure with a tube projecting from its mouth, suggests an Ethiopian smoking a cigaret. Steam escaping from this tube was caused to impinge upon the vanes of a wheel revolving in a horizontal plane, and was expected to rotate it. Gearing on the vertical shaft of the wheel was expected to give such changes of motion and variations of speed as would permit the device to be applied to useful purposes, such as pumping water, sawing wood, grinding grain and the like. It was practically useless, but is of exceptional interest as a step in the development of the steam engine. That it had no relation whatever to the type of steam motor developed by Watt and his suc-

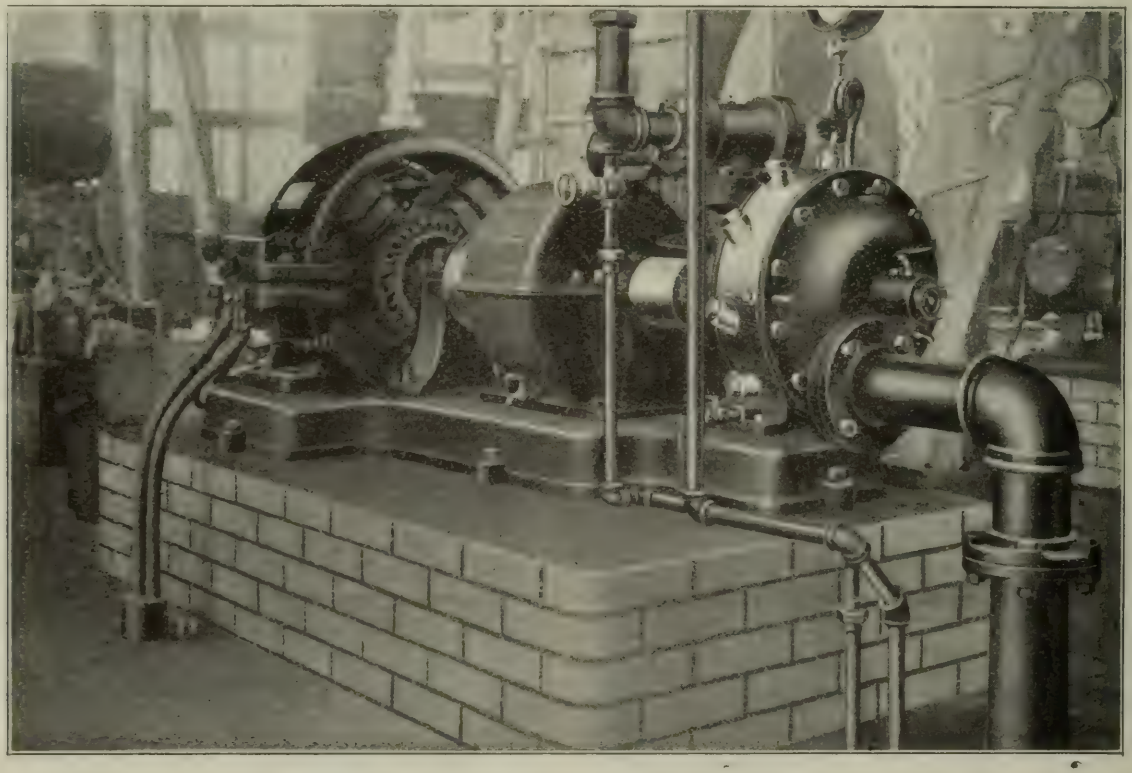
cessors only makes it the more interesting.

The great development of the steam engine began where engines were most needed, in England. Newcomen and Calley were its pioneers with what was known as the Newcomen engine. Smeaton improved it, and some of his steam pumps are perhaps still in use. In 1725 James Watt invented the separate condenser, and with better tools and more skilful mechanics his work would have approximated the best engine-

BRANCA'S WHEEL AND ENGINE.

building standards of the present time. As all who preceded had done, Watt began with an attempt to pump water economically by steam-actuated mechanism; when his work was finished the mill engine, steamship and locomotive were possible. To follow the development of the steam engine from this point would but lead to the conclusion that before the present century began it had been refined to a degree which suggested that the seeking of further economies would be more costly than profitable. Nothing seemed better established than the type of engine then in use; nothing less probable than its displacement by another, cheaper and simpler type. The apparent limit of safe prophesy was that thenceforward the work of the mathematician and mechanician would best be directed to the perfecting of minor and relatively unimportant details. The great facts of steam in its applications as a motive force had been learned, and the position of the ambitious inventor in this field recalled one of the charming natural history essays of Grant Allen, in which he tells how for centuries there has been a struggle between the squirrels and the nuts in obedience to the law of the survival of the fittest. During this period the squirrels have been strengthening and sharpening their teeth the better to gain their food, and the nuts, as a measure of self-protection, have been growing thicker and tougher shells; with the result that all the soft nuts have been eaten and the squirrels, with weak and dull teeth, have starved to death. This appeared to be the situation in the field of steam engineering—the easy problems had all been solved and the tough nuts which remained were unavailable to the merely ingenious and clever inventor. What might be gained by cracking them belonged to the men who could bring to bear upon their work the results of long study in the several fields of science, supplemented by wide experience in mechanical applications. Like many other popular concepts of the stability of the established order of things, this was not quite correct. What the mechanical squirrels needed was not sharper teeth so much as clearer perception.

Curiously, the first radical improvement in the steam engine since the time of Watt involved brushing aside as useless and misleading the work of the most productive century in the world's history, so far as this related to valves and valve motions, cutoffs and other refinements of steam engineering, and rendered obsolete unnumbered volumes of highly involved mathematics which were the despair of the student of this department of mechanical science. The revolutionary intrusion into the field of the reciprocating engine was the form of motor known under the generic name of the steam turbine. It is of peculiar historical interest that one of the very earliest patents relating to this general type of motor was taken out by James Watt in 1784, but he does not appear to have gone beyond a somewhat vague conception of the rudimentary idea of the turbine. In the same year Wolfgang de Kempelen patented a turbine which was an adaptation of the æliopile to pumping water. In this form the turbine awaited development until 1843, when Pilbrow patented a form which showed a very clear concept of the principles which have since found a high utility in application, and which are



embodied almost as Pilbrow drew them in several of the turbine engines now on the market in a large way. In 1848, Wilson, of Greenock, patented the radial-flow turbine. No radical improvement upon these early types was made until 1875, when Professor Reynolds, of Manchester, patented the reaction steam turbine, with alternating rings of fixed and moving blades, and which accomplished the then miraculous feat of running at a speed of 12,000 revolutions per minute. The later history of turbine improvement brings it within the sphere of current commercial development and cannot be followed without a discussion of the points of difference between competing types.

A brief and non-technical description of the steam turbine may be of interest for those who read about the progress of this type of motor with little or no knowledge of what it really is. The steam turbine is a machine for maintaining rotation, which may be utilized for driving one or another kind of machinery, and is itself rotated by particles of steam acting upon suitably formed surfaces attached to the parts of the machine adapted to revolution. Steam is composed of molecules possessing mass moving at high velocity. This is utilized mechanically by permitting the steam to give up its heat by conversion into work in rapid expansion, as in the action of the exploding charge of a gun, where the rapid expansion of the gases carries not only the projectile but the molecules of the gases themselves forward with effective rapidity. In this expansion the molecules push out of their way anything which retards or tends to change the direction of their progress. One way in which this displacement is expressed in the gun is in its recoil; the gases, expanding equally in all directions, pushing as hard against the relatively immovable breach as against the relatively movable projectile. If the projectile were heavier than the breach it would remain stationary and the gun would be driven through the gunner. Sometimes, in the case of a gun which "kicks" badly, this is what the gunner thinks has happened. In the turbine of the reaction type this recoil, or "kick," is utilized for producing motion in the movable parts. Briefly described, the simplest form of turbine consists of a shell or casing, enclosing a cylinder capable of revolution. On the inside of the fixed casing are attached certain guide blades and on the outside of the movable cylinder are certain other blades or fins, bearing such relation to the fixed ones that steam entering at one end of the casing and seeking to escape at the other is given by the guide blades a direction which causes it to impinge directly upon the movable blades, which it pushes aside, just as a current of wind revolves the windmill. By so doing it causes the movable cylinder to rotate. This sequence of fixed and moving blades is susceptible of multiplication as many times as may be desired, the fixed blades in every case acting as guides and the movable blades receiving the impact of the directed steam and being displaced by it. Thus the rotative effect is produced by both impulse and reaction. In the simple impulse turbine the steam is led by nozzles so placed as to discharge against the periphery of a movable annulus provided with blades or fins to offer resistance, and be displaced by it. This elementary idea seems capable of many fold amplification and differentiation. The fact that every type of steam turbine differs a little from every other type is interesting, perhaps, but the differences would scarcely repay analysis nor would such analysis make the matter any clearer to the reader not skilled in the art.

In the illustration on page 150 is shown a typical steam turbine, capable of as much work as a very much larger and more costly engine of the reciprocating type, and of enormously greater rapidity of revolution. It is shown driving a dynamo, and is from a photograph of the turbine and dynamo "coupled in tandem" in the Federal exhibit at the recent industrial exhibition in Manila. For the purpose of showing what a high power steam turbine looks like, in comparison with a reciprocating engine of equal power, it will serve as well as another.

The steam turbine is still new and its sphere of utility is still indeterminate. In a general way it may be said that it is pushing the larger, more complicated, more delicate and more costly recipro-

cating engine very close for all kinds of work. Originally its utility seemed to be limited to work calling for rotation at very high speeds and in one direction only. With the improvement in mechanical construction it was found practicable to give rotation in either direction, and high velocity of revolution was perfectly controllable by gearing. In mill and factory practice the advantages of the turbine are conspicuous, although in these uses it rarely comes into competition with the highest development of the reciprocating motor. In such competition it has been found that, while possessing

MODERN COMBINED TURBINE AND DYNAMO.

marked advantages in first cost, floor space, convenience, economy of repairs and adjustments, oil consumption and attendance, it has not thus far shown an economy exceeding that of the best type of triple expansion reciprocating engine. It must be admitted, however, that they run very close together, that the turbine is steadily gaining, while the older type of engine seems to have reached the attainable limit of perfection, and that in a great many uses the turbine already has a conspicuous lead, especially in the generation of electricity.

The recent important progress in the application of the turbine in marine engineering has made it of great public interest. The concurrent decision of the British Admiralty and the management of the Cunard Steamship Company to install turbines in place of reciprocating engines in many vessels of first importance appears in every instance to have been vindicated by the performance of these motors in use. The service tests, covering a wide range of experience from the initial experiment in the "Turbinia" in 1894, to the Cunarder "Carmania," the "Lubec," of the German navy, the "Salem" and "Chester," of the United States navy, "No. 243, "Libellule" and "Caroline," of the French navy, and the "Dreadnaught" and "Amethyst," of the British navy, besides some forty or more liners Channel steamers and steam yachts establish the fact that this is the type of marine engine which is destined to displace all other types. Their principal advantages are cheaper operation, the absence of vibration due to the swing of reciprocating machinery, reduction of weight and greater speed with smaller and more deeply immersed propellers.

Thus we find completed, or, at least, in process of completion, the wonderful cycle beginning with the æliopile and ending with the engines of the most advanced steamers afloat—the largest, fastest and most perfect in design and equip-

ment ever built. The two differ no more widely than may be accounted for in the fact that the material and tools now at the command of the mechanical engineer permit him to complete what the ancients so wisely began, and to realize the remarkable prophecy of Roger Bacon, the learned Franciscan, who wrote more than eight hundred years ago:

"I will now mention some wonderful works of art and nature in which there is nothing of magic and which magic could not perform.

"Instruments may be made by which the largest ships, with only one man guiding them, will be carried with greater velocity than if they were full of sailors."

NEW YORK CITY.

In the Cathedral

BY FREDERICK LYNCH

THE window is of gold, and angels in it throng,
And white wings throb, and faces are upturned in song;
The faces shine with light, sweet light for which I long—
  And then I turn to her who with me gazes on the angel faces,
And lo! the glory too in her sweet face doth shine,
    And it is mine!

Above the altar stands a pure, white angel, tall,
With outspread wings, and from whose hands sweet blessings fall;
"Oh, bless me also, dearest angel," low I call;
  And then I turn where she I love is resting 'neath the angel's blessing,
And lo! the blessing too in her deep eyes doth rest,
    And I am blest!

There is a great, blue window, and a beam of light
Floats thru and lingers on the angel's hair, where bright
The face glows 'mid the deep'ning shadows of the night,
  And then I turn where she, adoring, prayeth to the angel soaring,
And lo! the light hath kissed her hair, and she doth own
    The angel's crown!

And now the light is slowly fading. One last smile
Of love the angel sheds. I linger on a while.
If only from that face one glance I might beguile;
  And then I turn where she is leaning toward the angel beaming,
And lo! the love which from the angel fills the place
    Is in her face!

NEW YORK CITY.

The Japanese School Children of San Francisco

This unique photograph, which is furnished us by Mr. K. K. Kawakami, shows a group of some of the excluded Japanese children who are now attending a school organized and maintained by the Japanese in San Francisco (not the "Oriental School"). Mr. Kawakami, who has just made a trip to San Francisco to investigate the whole situation says the root of the trouble, from the Japanese standpoint, lies in the fact that the question involves the honor and national pride of the Japanese Nation. Even more offensive than the discrimination itself, he says, was the method by which this measure was put into execution. If the San Francisco authorities having found it necessary to separate the Japanese children from their American schoolmates had shown a little more sympathy and had previously explained to the Japanese parents, or some representative Japanese, why such discrimination must be made, affairs would have taken a very different course. But, without any previous warning, on the morning of November 12th, the Japanese public school pupils were dismissed from their class rooms, humiliated and disgraced before their American schoolmates, and were sent home to their parents with tears in their eyes. And yet the Japanese Consul at San Francisco, in his official communication to Secretary Metcalf, said that in so far as any Japanese in San Francisco has been able to obtain evidence "no Japanese pupil of the public schools has misbehaved or conducted himself, or herself, in an offensive manner warranting expulsion or segregation. On the contrary the teachers consulted have invariably given the Japanese children credit for good behavior, attention to duty, and cleanliness of person." Mr. Kawakami says that the Japanese residents of San Francisco believe that the present agitation against them is not the result of any widespread hostility on the part of the citizens of the State as a whole, but it is instigated by a few agitators for political effect, and kept alive by the "Japanese and Korean Exclusion League" and some of the trade unions. It is practically certain, Mr. Kawakami thinks, that if the San Franciscans do not recede from their present position the Japanese in San Francisco will refuse to send their children to the "Oriental School," which is located near the most depraved section of "Chinatown," but will start private schools of their own. And such an eventuality cannot fail to perpetuate a feeling of animosity between the Californians and the Japanese population of that State, which in turn may effect more or less unfavorably the hitherto cordial friendship between the United States and the Mikado's Empire.

Literature

Early American Explorations

It is needless to observe that in the publication of historical source-materials of one sort or another a remarkably large share of the strength of our historical laborers is today employed. We seem to have given up the writing of great histories, Rhodes, McMaster and Channing to the contrary notwithstanding, and to have turned our whole soul to the gathering and duplication of the records of the past. We have a great series of travel narratives, now completed, by Thwaites; another, just begun, by Jameson. And we have the gaps between filled up by detached works and lesser collections.

The firms of Clark and of Barnes, already notable in this publication of geographical description, come to our attention once more with their recent crop. Clark brings to us four works, in imposing dignity, with their broad margins, commendable letter-press, and the wicked legend of a "limited edition." Barnes continues "The Trail Makers" with the well-known journeys of La Salle, Cabeza de Vaco and Champlain, in the cheap and convenient volumes which have hitherto brought other texts to the reader, easily and economically. Between them more than three hundred years of American travels are opened to our inspection.

Chronologically speaking, the works at hand begin with a much-needed translation of Antonio Pigafetta's account of the earliest circumnavigation of the globe.[1] Only by courtesy can the work be included in a list of American travels, since Magellan's voyage touched but a few isolated spots in the Latin Americas and was uninfluenced by any premonitions of the future greatness of the Atlantic barrier around whose end it skirted. The experience which its editor, James A. Robertson, has had in the greater undertakings with which he has been connected, makes his opinion here as nearly final as any single opinion is likely to be, and leaves us in the conviction that this is a definite edition.

From Magellan to Cabeza de Vaca[2] is a brief jump in time, but a long distance in historical significance. Pigafetta's narrative is a contemporary record of observed phenomena. Cabeza de Vaca kept no journal; and from the day he disappeared into the wilderness of the Gulf plain, in 1528, until he startled his countrymen by his arrival at San Miguel de Culiacan, in 1536, he had only a treacherous memory, re-enforced by a vigorous imagination, for his guide. He wrote his "Relacion" only after his arrival in Spain, several years later than the occurrences of the events which it describes. The narrative is a fascinating romance, and well entitled to a place in "The Trail Makers." At times it records facts that subsequent knowledge has confirmed; but the identification of its geographical references is beyond any editorial skill. The editor here, A. F. Bandelier, is content to "suggest" the line of travel of the narrator.

The career of Samuel de Champlain comes, in point of time, two generations later than that of Alvar Nuñez, and is localized at the other end of the continent. A new translation made from Champlain's own final edition of 1632 is now edited in two volumes of "The Trail Makers," by Edward Gaylord Bourne.[3] Professor Bourne always speaks with authority on matters of early exploration, and here he has been content to give the simple introduction demanded by the series.

While we are unable to say where Cabeza de Vaca went or what he saw, we are well informed as to the course of the next of our Western explorers, La Salle, and have before us two reprints of narratives of his voyages. Prof. Isaac J. Cox, of the University of Cincinnati, and trained in Western history by Professor Garrison, has a useful two volume edition in "The Trail Makers."[4] The bibliography at the end of Volume II is much

[1] Magellan's Voyage Around the World. *By Antonio Pigafetta.* Edited by *James Alexander Robertson.* Two vols. and index. Cleveland: The Arthur H. Clark Co. $7.50.

[2] The Journey of Alvar Nuñez Cabeza de Vaca and His Companions from Florida to the Pacific, 1528-1536. Edited by *A. F. Bandelier.* New York: A. S. Barnes & Co. $1.00.

[3] The Voyages and Explorations of Samuel de Champlain, 1604-1616. Edited by *Edward Gaylord Bourne.* Two vols. New York: A. S. Barnes & Co. $2.00.

[4] The Journeys of René Robert Cavelier Sieur de La Salle. Edited by *Isaac Joslin Cox.* Two vols. New York: A. S. Barnes & Co. $2.00.

better than the editor's literary style. The contents of Volume II, Joutel's journal of the last voyage, is the basis of a single volume, edited by Henry Reed Stiles and published by Joseph McDonough, at Albany.[5] The Stiles edition is sumptuous and expensive. Its complete introduction and its full bibliography, by A. P. C. Griffin, are free from the limitations in space and form that coerce the "Trail Makers" volumes into simplicity.

Professor Hodder edits, in a single Clark volume, Captain Philip Pittman's "Present State of the European Settlements on the Mississippi."[6] The original, appearing in London in 1770, was prepared, so the writer declared, for the perusal of the Secretary of State, who may well have been interested in the valley so recently acquired from France. It is written in gazetteer style, and is the earliest English account of the settlements in question.

The "Personal Narrative" of Elias Pym Fordham, dating from 1817-1818, is edited by Frederic Austin Ogg.[7] Fordham was an observant civil engineer and a member of the Birkbeck colony in Illinois. The narrator describes his journey over the Pennsylvania Pike into the West, and is a reputable eye-witness of the movement of population which followed the second war with England. It may perhaps be regretted that the editing brings into the notes a veritable concordance upon Thwaites' "Early Western Travels." The scholar is beyond the need of so many notes, and the general reader does not want them.

And finally, we come to the end of our shelf, and to the memory of men now living, in the journal kept by John Woodhouse Audubon, son of the naturalist and himself of no mean scientific and artistic attainments, in his overland journey to California with the "forty-niners."[8] As in no other of our collection, the whole history of transportation is summed up in this single trip in 1849-1850. By rail and stage over the National Road, Audubon's party came to Pittsburg; by river steamer they descended the Ohio to Cairo and the Mississippi to New Orleans; thence across the Gulf to the Rio Grande; and by pack train thru the interior of Mexico to San Diego and the gateway to the gold fields. This route was not a common one, even in the days of constant continental journeys, passing as it did midway between the Santa Fé trail and Panama. Its record shows on every page the keen observation of the scientist and the persistent courage of the pioneer. We are somewhat surprised that a geographic expert like its editor, Professor Frank H. Hodder, should have allowed the path of the party in 1849 to be recorded upon a base map that could not possibly have been accurate at a period earlier than 1853.

Hilligenlei

Hilligenlei, or *Holyland*,[1] as the translated title reads, is the latest work by Gustav Frenssen, who is best known in America by his novel, "Jörn Uhl,"[2] that set all Germany agog several years ago and which has been styled in Germany The Modern Iliad. Last year Frenssen electrified Germany anew with *Holyland,* which has been convulsing Germany for months. You can scarcely take up a German literary journal without hitting upon some discussion of it.

The plot, altho typified and made humanly engrossing, is not the significant thing about the book. We see here once more, in the depiction of scenes of fairly primitive life, a novelist choosing and working with the motives and materials that have lately become so popular in fiction. They offer in this case abundant opportunity to make use of the ideas given currency by the Nietzschean philosophy and modern socialism, besides lending a setting in keeping with

[1] HOLYLAND. *By Gustav Frenssen.* Translated from the German by *Mary Agnes Hamilton.* Boston: Dana Estes & Co. 1906. $1.50.

[2] JÖRN UHL. *By G. Frenssen.* Translated from the German by *F. S. Delmer.* Boston: Dana Estes & Co. 1905. $1.50.

the latter day return-to-nature movement.

An isolated North German community on the shores of the German Ocean, remote from the modern world, which at times is felt only as a dull, distant hum, offers a good background, and the sea-faring life of the main characters introduces the desired dash of adventure and hardship. Touches of the world of today—business, the army, the university, the great city—are supplied, and thus a *Weltbild,* which every German novel purports to be, stands before us.

The emphasis is, quite naturally, on the development of character. Not only are the principal characters very human, but in true German fashion there is put into the depiction of character a wealth of philosophy. No better commentary on the many-sided, seething masses of German life of today could be desired. Aside from the burden of the book, which is a rationalistic account of the life of Christ, and which bids fair to revolutionize the religious life of Germany, we find here the mature thought of a serious, capable mind on many of the deepest questions that are agitating thinking men and women today, not only in Germany, but elsewhere. How far to yield to the materialistic as against the idealistic conception of life? How far to embrace the call for greater freedom from the shackles of civilized society? How far to allow our natural instincts to guide us?

Such queries and their answers are put before us as living conditions in the lives of living people, and no thoughtful reader can lay the book down without answering them for himself.

Frenssen's point of view makes itself felt thruout. He believes in the life of aspiration and manly struggle—not, however, after the fashion of the anemic idealist, but rather as a practical man of the world who knows life—as Frenssen had ample opportunity as a pastor in the region of which he writes to acquaint himself with it—and who finds that hard and fast norms of conduct for all alike are impossible.

The book will never be popular in America, it is safe to say, for several reasons. It is, like a German sentence, long-winded, involved and cumbrous, lacking the briskness and lively action we are accustomed to. The reader gets the characters confused and loses interest in them. *Holyland* contains several passages which make it unfit for the youthful, and even many older readers will find them offensive. And because we are in a very different stage of theological thought from Germany, the religious purpose of the novel will fail to arouse either the enthusiasm or the antagonism that it has in Germany.

The intercalated life of Christ is really intended as a summary in a literary form of the scientific and theological investigations and arguments of the last century or more. Here is the flower of the sowing of rationalism, materialism and socialism; the Bismarckianism, Wagnerism and Nietzscheanism of the past century. What wonder that the strong potion brewed from these most powerful ingredients of the German *Weltanschauung* of the past century, and offered here for the first time in beguiling form to the broad strata of the public, should have excited these almost to the point of frenzy!

The Guilds of Florence

Only a student with an artistic temperament can write on Florentine history, for no one who knows not the delight of the eye and the joy of creation can even approach an appreciation of that famed city celebrated by Shelley as the fairest under the sun. Yet, paradoxical as it may seem, the artist is the last person in the world who should be charged with such a task; he is essentially an impressionist; he revels in lights and shades, in situations, dramatic unity and *dénouements;* and above all he shrinks from those tests of objectivity and reality which the ponderous tome-making German scholar has imposed upon the historian. Notwithstanding these difficulties—which must be apparent to any historical writer who attempts a study in Florentine history—Mr. Edgecumbe Staley has undauntedly sought to lay bare for us the very heart of the economic and artistic life of the city as

revealed in the rise and development of the guilds.* Mr. Staley has the temper of an artist. His story of the Florentine guilds is a drama; its stage setting is the classic vale of the Arno; upon this stage appear mighty figures of war, like Cæsar and Charlemagne; learned men of the university, like Pico della Mirandola and Leonardo da Vinci; great captains of industry and commerce whose products are the envy of all the West and whose argosies spread their sails over the waters of the Mediterranean and even beyond the Pillars of Hercules. The result of all this is glorious: "Florence presented the rare spectacle of a State whose citizens were either all wealthy or at least comfortably off" (p. 65). But the grand drama comes to an end: "The liberties of a free people and a free parliament were buried in the grave of the Republic of Florence" (p. 74). In the last act "the love of country and the ties of family were weakened by an universal craving for pleasure and self-gratification. Idleness, sensuality, skepticism —three baneful sisters—gained the upper hand and loosened the fabric of Florentine society. The gradual extinction of public spirit, the slow deterioration of general character and the sapping of personal energy are the dull tones which tinge with melancholy the later pages of Florentine history. Ring down the curtain." Here is the "Nowhere" of William Morris spoiled by individualism and modernity!

"I shall write an advertisement myself," he said.
From Barbour's "A Maid in Arcady." Lippincotts.

Easy as it would be to quarrel with the impression caused by this presentation, and to detect inaccuracies, the heart of Mr. Staley's book is sound. He has taken pains to tell effectively and fully a great story—a story that has far more than mere antiquarian interest for those moderns who do not find in Pittsburg or the Chicago stock yards the final realization of democratic vistas. It is not an important contribution to historical

* The Guilds of Florence. *By Edgecumbe Staley.* Chicago: A. C. McClurg & Co. $5.00.

knowledge but an attractive work for the general reader. The volume is prefaced by two chapters on the development of the commerce and industry of Florence and the general history of the guilds. Seven chapters are devoted to the seven Greater Guilds of the judges and notaries, the merchants, the wool-workers, the bankers and money changers, the silk-workers, the doctors and apothecaries, the furriers and skinners. The Intermediate Guilds of butchers, blacksmiths and shoemakers, masters of stone and wood, the retail cloth dealers and linen manufacturers are treated in two full chapters. About one hundred pages are devoted to the nine Minor Guilds of wine merchants, innkeepers, tanners, oil merchants, general provision dealers, saddlers, locksmiths, armorers, carpenters and bakers. An excellent index and a full table of contents placed at the head of each chapter furnish a clue to every important topic for the reader who wishes particular knowledge on particular points and who has not courage to attempt the entire book. Fortunately our author has not contented himself with the descriptive details of institutional organizations; in six very entertaining chapters he gives us a glimpse into the life and work of the medieval city and into the religion, patronage and charity of the guilds. The volume is in every respect complete; there is a splendid bibliography of manuscript and printed materials; the index and tables are full and really helpful; the illustrations are drawn from a great variety of sources, ancient manuscripts, paintings and special photographs which have evidently been secured with no thought of expense or labor, and from a typographical standpoint the publishers have done their full duty.

A Maid in Arcady. By Ralph Henry Barbour. Philadelphia: J. B. Lippincott Co. $2.00.

The "Arcady" of Mr. Barbour's latest romance is situated on the shores of a little New England river and haunted by a make-believe wood nymph of New England extraction. The hero commits trespass on the first page, petty larceny on the seventy-ninth, and grand larceny on the hundred and fortieth, but these technical crimes sit lightly on his broad-shouldered conscience. It is a somewhat trivial tale, pleasantly illustrated by photographs that do no violence to the Arcadian atmosphere of the places sketched in the text. A little river ripples thru the story, a canoe plashes along several chapters, an amiable motor car comes and goes conveniently, and the maid and man who introduce themselves to each other in Arcady play a pleasant masquerade of "Clytie" and "Vertumnus," a pretty pastoral drama darkened for a moment by a passing cloud of misunderstanding, but dear to all youths and maidens in Arcady—and who has not lived at least one summer in that land of shy make-believe?—are the veils and subterfuges of half-acknowledged love.

Credit and Its Uses. By William A. Prendergast, New York: D. Appleton & Co. $1.50.

The general desire for systematic information regarding the methods and practices of business enterprise which is becoming more manifest each year has led to the publication of a number of practical treatises on the various institutions of industry and finance. Appleton's business series, in which the present volume is included, has probably met the popular demand more effectively than other similar publications. The aim of this series has been to present the practical aspects of business problems. This is clearly evident in the volume on *Credit and Its Uses.* The author has had practical experience in banking circles and has written the greater part of his treatise from the standpoint of the "credit man," a profession that has come to occupy a foremost position in the business world. The weakest part of the book is that dealing with the theory of credit. The author inclines to uphold the somewhat antiquated views of the Scotch economist, Henry Dunning MacLeod, regarding the "capital" quality of credit. He also fails to emphasize sufficiently the chief social function of credit, viz., the maintenance of the competitive system. Credit enables society to overcome the obstacles of the individualistic economic system, by placing the capital of persons in-

capable or unwilling to employ it productively into the hands of those most capable of its productive use. The social disadvantages of the inequalities of individual wealth are thus largely avoided, while at the same time industrial enterprise is possible of almost indefinite expansion. Corporate business organization is the leading example of the development of the modern credit system. The author distinguishes four kinds of credit: (1) banking credit, (2) public credit, (3) individual or personal credit and (4) commercial credit. To these he might have added a fifth, viz., "social" or "customary" credit, which is distinguished from the others by the fact that it is based on confidence in the customary demands of society rather than in particular individuals. All business enterprise is dependent upon this form of credit, as neither production nor business speculation would be undertaken if the confidence that society will continue to demand certain customary commodities and services did not exist. But it is not the purpose of the book to analyze questions of this kind. Its aim is to reach business men and students of practical finance, and accordingly most of its pages are devoted to an intelligent and trustworthy discussion of credit administration and the problems involved in credit insurance and legal redress for credit losses. Facsimiles of blanks and forms used in credit institutions give additional clearness to the information contained in the author's text.

Doc. Gordon. By Mary Wilkins Freeman. New York: Authors' and Newspapers' Association. 50 cents.

This volume is issued by "The Authors and Newspapers Association," and there is an interesting "Notice to Purchasers" printed on the inside of the back. The substance of it is that he is forbidden to resell or advertise the volume for sale before August 1st, 1907. If he does "the title immediately reverts to the publisher"—whatever that may mean. Also "any defacement, alteration or removal of this notice will be prosecuted to the full extent of the law." What the full extent would amount to is not stated, but it all sounds very strange and threatening to the poor average reader, who is accustomed to being cajoled and not threatened by the publishers of novels. Fortunately nothing is said against giving the volume away, and doubtless some will rid themselves of temptation in this manner. But suppose the purchaser has a book-plate with his family motto and coat of arms upon it, and suppose he pastes it on the inside of the back where it is usually pasted, will he be "prosecuted to the full extent of the law" for thus altering or defacing the notice? Or, suppose, he should be stranded in a strange city with nothing in his pocket but Mary Wilkin-Freeman's last, and suppose he should exchange it for a roll and a cup of coffee, exactly who would be the loser if the title should "immediately revert to the publisher"? As for the story, it is like the price—popular. A stocking is not a stocking when it has been raveled, but merely a skein of crumpled thread; just so, this book holds attention while one reads it, but, having finished, it seems a rather poor affair as compared with some of Mrs. Freeman's other stories. The one feature likely to interest us is the question the author raises as to whether it is right to end the sufferings of a dying woman by administering an opiate, or whether the doctor was justified in letting a dog kill a man who was apparently getting ready to kill some one else. Whatever the answer is, Mrs. Freeman shows that the doing of such deeds is not salutary in their effects upon the conscience. And that is the test which keeps some people more scrupulous than they would be otherwise. The doctor is a fine man who is driven to drink because he has a number of secrets to carry about with him; not one is really discreditable, but the very weight of them drags him down. And this brings us to consider a new phase in Mrs. Freeman's book—the men in it drink cheerfully and without regret, as they do in novels written by men. Dr. C. Gordon and his young assistant consumed enough apple-jack every day to make them stagger thru every chapter of the tale. But they do not stagger. And here again we see the masculine influence, for in a man's novel men rarely get drunk, no matter how much they drink. The question is whether such

carryings-on are true to life, and, even if they are, does it not require unusual nerve in a woman to brew punch so often for her male characters?

Literary Notes.

....Two literary biographies of especial interest will soon appear from the press of G. P. Putnam's Sons; a *Life of Walter Pater,* by Thomas Wright, and the second volume of Bielschowsky's *Life of Goethe,* covering the period 1788-1875. The first volume of this work we included in our review of the most important books of the year.

....Probably the most satisfactory edition of the *Arabian Nights* for public and school libraries is the Lane translation, now republished in Bohn's Libraries in cheap form. (Macmillan, 4 vols., $4.00). It is a scholarly translation and as complete as one can be that is intended for general circulation. This edition is edited by Prof. Stanley Lane-Poole and contains about two-thirds of the whole number of tales belonging to the thousand and one nights, as well as Aladdin and Ali Baba, which do not form part of the series in the Arabic. The long explanatory notes of the original Lane edition are omitted in this.

....An index to about 120,000 portraits published in books and magazines has been prepared by the American Library Association and published by the Library of Congress. The work has been in preparation for over ten years, as it has involved the collection and classifying of an immense amount of material. Some 40,000 persons of all countries and degrees of celebrity are included, and over 6,000 volumes have been searched. This *Portrait Index* will be very valuable to all historians, genealogists, editors and other makers of books, and it has fortunately been placed upon the market at cost. It is for sale by the Superintendent of Documents, Government Printing Office, Washington, at $3.

Pebbles.

[In accordance with our invariable yearly custom, we cull this week a few garlands of "Little Willy" poems from the college funny papers. This brand of humor (!) shows yet no perceptible signs of decline. —Editor.]

Young Roger in a mood of choler,
Thrust his head 'neath a traction roller;
The neighbors were all surprised to find
How it had broadened Roger's mind.
—Princeton Tiger.

Johnny built this morning's fire
In the kitchen stove;
Now the family's dressing in
Yonder maple grove.
—University of California Chapparal.

Little Willie on the track,
Didn't hear the engine squeal;
Now the engine's coming back,
Wiping Willie off the wheel.
—University of Pennsylvania Punch Bowl.

Till midnight from early morning,
Jack, his small interior scorning,
Ate plum pudding, pie and turkey;
Then, when his tum failed to work, he
Left this hungry world behind.
"Flowers gratefully declined."
—Princeton Tiger.

Last week Tuesday Gentle Jane
Met a passing railroad train,
"Good afternoon," she sweetly said,
But the blamed train simply cut her dead.
—Yale Record.

Cute little Rita
Ate some saltpeter,
Sulphur and carbon, too,
And when she had eat,
Lit a small cigaret—
This fly little maiden then flew.
Moral: If you meddle with fire and fireworks, too,
You are bound to be fired before you get thru.
Columbia Jester.

Eugene was caught between two trains,
Folks with a bag picked up the remains;
The neighbors were greatly stirred up by the scene,
And the only collected person was 'Gene.
—Harvard Lampoon.

There was a fresh freshman named Reece,
Mixed some chemicals in with some grease,
Held it over a flame
And exploded the same,
Now we're sending him home piece by piece.
—Cornell Widow.

Willie fell into the sea,
Drowned in awful agony.
Mother heard the cries he gave,
"Billy never liked to bathe."
—Stanford Pelican.

Jasper Green's in slumber sweet,
Just where the mower's cutting wheat;
They'll have to buy the whole machine—
'Twill be hard to separate Jasper Green.
—University of Michigan Wrinkle.

Little Willie at the table,
Just as hard as he was able,
Hit his mother with a platter,
And remarked, "That swats the mater."
—The Cornell Widow.

Fritzy drank some nitro-glic,
"Gosh, dat's goot!" he said,
"Vat iss?"
Then he slipped upon the coping.

* * * * *
* * * *
* * *

Mere words fail me, but—here's hoping—.
—The Yale Record.

Resourceful Mame fell down a well,
Whence all egress did fail,
She simply cleared her throat and then—
Ran lightly up the scale.
—Vassar Miscellany.

Editorials

THE semi-annual index of THE INDEPENDENT for the last six months of 1906 is now ready and will be sent free to any subscriber who will notify us that he wants a copy. Of course those who return us the twenty-six issues of the magazine will have the index bound in the volume.

The Railway Investigation

OCCASIONALLY the curtain is lifted and the American people are permitted to see quite clearly what their captains of finance are doing. When it was raised by Mr. Hughes, during the life insurance investigation, what they saw filled them with disgust and anger. Such must be their emotions now, as the operations of the captains in railway finance and intrigue begin to be brought to light by the investigation of what is called the Harriman system. And some of the same captains that were found digging in and handling the huge life insurance surpluses are the chief figures in this mess of railway scandal.

What do the American people see as the railway witnesses begin to answer the Commission's questions? There is shown to them the procedure by which the railroads of the whole country are being gathered up and are passing under the control of a little group of immensely rich men. They already knew, to be sure, that this work of concentration was going on. But this investigation shows just how the work is done—how the captains, thru their trusted agents, use the earnings and credit of one railway to buy control of another; how faithless and subservient directors turn over their powers to such agents; how both the agents and the greedy captains incidentally take advantage of the opportunities offered by ownership or control for enormously profitable speculation in securities; how the power acquired by the captains is exercised for the punishment of men who stand in the way because they prefer old-fashioned honesty in the management of corporations; and how "swollen fortunes," built up in the early stages of their growth by practices both unjust and unlawful, are continually swelling to greater and more menacing dimensions by reason of other practices not less hostile to the public interest.

It is easy now for many to understand why control of the great life insurance surpluses was sought and held by the captains, and why it is so difficult to separate the captains from these accumulations of the people's money. They do not think of stealing either the life insurance funds or the railway earnings. They merely want to be free to use them in shifting great quantities of stocks back and forth between themselves and the companies of which they are directors, or in financing surely and hugely profitable investments (which are never really speculative), suggested by early information about large and unexpected dividends to be declared by corporations which they control, or in other operations devoid of any risk or loss because of their own dominating influence in shaping the financial events which are to take place.

He must be a slow-witted man who thinks that the greatest of our swollen fortunes have grown or are still growing only by the ordinary rates of interest. This investigation shows how small such rates are in comparison with the increment that may be gained in a month, a week, or even a day, by captains who have taken the precaution to place themselves in the way of great opportunities, or to create the opportunities for their own use. Of course, it is necessary at the beginning for such a captain to get rid of all traces of a conscience. He may find it expedient not only to rob the public and to knife his old friends and benefactors, but even to steal the Government's land by means of gross fraud and the subornation of perjury.

Concerning the most prominent questions and transactions to which the investigation relates, the testimony, while convincing, is still incomplete. We refer to the development of a railway monopoly between the Mississippi and the Pacific, south of the Hill roads; the use of the Union Pacific's securities or credit for the recent purchase of $103,000,000 of shares of other companies' stock; the exercise of extraordinary and apparently unlimited powers by Mr.

Harriman; the curious shifting of 300,000 shares of Southern Pacific; the amusing assertions of traffic managers that competition between two parallel lines inevitably continues to be "keen" after the two lines have become the property of one and the same owner or group of owners; the sale of large quantities of stock to the Union Pacific by several of its directors, whose profit, it is asserted in the financial columns of the daily press, must have been reckoned in millions; and the remarkable withholding from the public, for two days, of the extraordinary dividend announcement in August last. This act is to be considered in connection with the rumors prevalent at the time concerning the profits of a great pool of stock.

For those who had information two days in advance, and also for those who knew some weeks earlier what was to be done, there was an opportunity for making great sums of money without the shadow of a risk. We shall be glad to see proof that the temptation which the situation offered was successfully resisted.

Each one of these questions and transactions deserves to be considered thoroly after all the testimony shall have been received. With respect to some of them the evidence now available, being undisputed and official, is conclusive.

It will cause a demand for Federal legislation more searching and stringent than the new Rate law. The present Commission is doing excellent work, but a larger one, with more authority, is needed for the adequate supervision of more than two-fifths of the world's railway mileage, capitalized at $14,000,000,000. Such supervision there must be, with strict official regulation, or the people will turn to Government ownership.

Mr. Mackaye's Pantocratic Inventions

It does not often happen that a system of social philosophy so profound and so comprehensive as Mr. Mackaye's study of poverty is put within the compass of a single magazine article. Indeed we question whether there are many systems of social philosophy, whatever their compass, as well deserving of serious examination as Mr. Mackaye's "Economy of Happiness" is.

Of Mr. Mackaye's analysis of the causes of poverty it is unnecessary to speak at length. It is penetrating, thoro, scientific. It rightly distributes the emphasis of explanation, and it reveals the independence of Mr. Mackaye's thinking. At a time when economists and statisticians are referring to Malthusianism as an exploded dogma, it is only a man of big intellectual caliber who can, without apology, restate the scientific verity of the Malthusian principle. Mr. Mackaye sees what the lesser men are curiously blind to, the tremendously important fact that a declining birth rate, so far from overthrowing the Malthusian proposition, is a complete verification of it. It is because population *tends* always to outrun subsistence that the birth rate in highly civilized countries is restricted.

It is to Mr. Mackaye's plan for the abolition of poverty that we wish especially to call attention. This plan is nothing less than a very great invention. It adds something that was lacking in the older schemes of socialism, but absolutely necessary to any socialism that could hope to be practically workable. It provides, as the older socialism did not, for a continuing transformation and improvement. Such an organization of society as Bellamy or Grunlund proposed would have been hopelessly static. It would have put an end to progress. Mr. Mackaye's pantocracy is dynamic to a degree.

Like all great inventions, Mr. Mackaye's plan is so simple that every one who looks into it will say: Why did nobody think of this before? Putting all the great industries under Government control and management, and organizing the labor force on civil service principles, and substantially like the Post Office, Mr. Mackaye would keep the entire system thoroly flexible and improving by a method of rewarding the class of managers. Every manager's salary would be increased in a given ratio in proportion as he succeeded in diminishing the average producing time required for completing the commodity which he was responsible for. This plan would force him al-

ways to study the ways and means of improving methods and diminishing waste of energy. There can be no doubt that such a plan would actually work. It would preserve and stimulate individual initiative. It would keep production continuously progressive. It is perfectly sound in theory, and in the long run, whatever is sound in theory is best in practice.

As average producing time was diminished, the producing community could either diminish its working day or enjoy the increase of real wages which would come in the form of a larger and cheaper product completed by each day's work. Actually the average community would take its gain partly in an increase of real wages and partly in a shortening of the working day. Thus the interests of managers, workers and consumers would be in fact identified, instead of thrown into irreconcilable conflict, as they are under the present competitive system. Here again Mr. Mackaye's theoretical demonstration is perfect. We predict that the orthodox political economists, if they try in the interest of competitive or individualistic production to invalidate Mr. Mackaye's reasoning, will give up the attempt as hopeless.

Mr. Mackaye's social economic philosophy may not immediately receive the attention it deserves, but it is one of those products of clear thinking which win their way in time. The longer it is studied, the more general will be the verdict among competent students of social economics that Mr. Mackaye has at least theoretically solved the hitherto baffling problem of reconciling large-scale public co-operation with the variability and progressiveness of individual initiative.

The Next Step for Spelling Reform

THE reform which seeks simplified spelling is not going backward. It received no setback when Congress, as might be expected from a body so ignorant of the subject, directed that the spelling used in Webster's Dictionary and other approved dictionaries should be restored. But the President was not disturbed, and directed that the 300 words should be used in his own correspondence; and he let it be known that he accepted membership on the Simplified Spelling Board.

While the reform progresses well in the United States, it needs to be developed in Great Britain. It has been proposed that there should be an international board established, composed of accredited scholars in Great Britain and America, who should agree on the reforms desired. England hardly likes to follow the lead of her daughter land. There has been in England not a little ridicule of the proposed spellings, as there has been here, but all this has helped the cause, and has brought out incontestable arguments in British magazines and journals, and has made it known to the British public that the most distinguished students of the English language are with the reformers; so that fools who came to scoff remain to pray for an international commission.

But that is hardly the next step. What is now needed is that simplified spelling boards, like that founded in this country by Mr. Carnegie, should be established in Great Britain, in Australia and South Africa. On this continent Canada can be, and is, united with our Simplified Spelling Board. These boards should be independent, but in general fellowship. They need not take our list of 300 words; they can make other lists, or can lay down general rules for uniform spelling, with examples under them. That would be more scientific—perhaps less practical—than our way. Our list changed the final *ed* to *t* in preterits only in cases where the poets had made the phonetic spelling somewhat familiar. Thus it gave *kist* but not *hist*. These British spelling boards should try, as ours has, to bring the subject to the public and persuade individuals to use the reformed and real orthography in their private correspondence, and in publications. The great importance of the reform can thus be made common knowledge, and the way will be prepared for general agreement on, perhaps, more radical lines.

For the proposals of the Simplified Spelling Board are far from logical or final, and were known to be so. Their purpose was to take a step forward while

making as little disturbance as possible. They would have given far less offense but for the word *thru,* which old fogies will not see is more correct and even more beautiful than the ugly *through.* These proposals, we hope, are only a beginning. They are meant to open the subject and to persuade the people that a considerable reform is needed, much more than was called for when commissions took up the task of correcting the medieval spelling of Spanish, French and German. Such a reform of our English spelling will be the work of no local board, but of a large commission of those who write the English language all over the world. And it is not likely all to be done at one step. A purely phonetic system requires a considerably larger alphabet. We wish it might soon be achieved, and that, we fear, is a task that will occupy the full century; all the more, because international agreement will be required as to the construction of a phonetic alphabet. When people have finished creating their international languages, Esperanto, etc., they may be ready to take up what comes before it—the agreement how to designate the sounds in the language they now use.

Semi-Segregated Chicago

Our editorial, entitled "Segregated Chicago," published October 25th, criticizing the university for its reactionary tendencies especially for its prospective abandonment of coeducation, brought us a number of letters of very conflicting tenor from University of Chicago people. Some commended our attitude and thought we had given a fair idea of the state of affairs there, while on the other hand Acting President Judson and others wrote us that we had done the university an injustice by criticizing it on the basis of an unverified press despatch, which in fact had no sufficient foundation, and that we had called in question the integrity of the living and the dead by assuming that partial segregation was adopted as a step toward complete segregation.

To all our remonstrants we at once offered space in The Independent, two or three times the space of the original editorial, in which to reply to our strictures, but they, one and all, refused to avail themselves of this opportunity. This was disappointing because we know many of our readers are interested in this novel experiment in partial segregation and would be glad to get an authoritative statement of its practical workings and of the future plans of the university. Just at this time such an article from Dean Judson, giving definite expression to his own views on coeducation, would be of especial interest, because he is regarded by many as the logical successor of Dr. Harper as president of the institution which he has long and efficiently served as an executive officer.

We are always wary of anything that appears in the daily papers about the University of Chicago because we know that misrepresentation of that institution is chronic with newspaper men, but in the report, which stated Dean MacClintock had announced that the carrying out of the new building plans would cause a gradual segregation which would ultimately result in complete separation, there was nothing so inconsistent with what we knew of University policy as to lead us to question its accuracy. We are informed since that Dean MacClintock did not say this, and in justice to him we are glad to make the correction. We do not, however, understand why he should not have said it, for it seems to be as safe as a statement can be that is dependent upon so uncertain a factor as future college politics. We have not seen the plans of the college halls soon to be erected, and do not know in how far they provide for separate class rooms, but their location in itself would seem to make arbitrary segregation to a considerable extent inevitable. Now, before these halls are built, is the critical time to decide whether the experiment of segregation of the junior colleges has proved so successful that it is desirable to make it the permanent policy of the university. A vote of faculty, trustees or congregation can be reversed, as the history of the segregation movement shows, but buildings designed and donated for a particular purpose straiten and fix educational customs and policy. The plan adopted by the faculties in 1905 for housing the undergraduates in eight "colleges," four

for men and four for women, somewhat after the manner of British universities, has some good features. It is, perhaps, only second in interest as an educational experiment to the preceptorial system of Princeton. But if it involves, as we understand it does, the enforced separation of the sexes in class, lecture, library and laboratory during the two first years, we fear it will be injurious rather than helpful because the natural, casual and continuous association in their daily work during the period of adolescence is the most effective factor in the development of normal and sensible men and women.

In our opinion, segregation in the Junior Colleges is a failure, and the policy should not be petrified into architecture and so fastened upon the university forever. It has proved to be troublesome, expensive, embarrassing, ineffectual and unpopular. It is not demanded by the students, for most of them have been trained in coeducational schools, and, after trying the novel scheme for a term or two, most of them spontaneously return to the mixed classes. In the present quarter, out of 68 Junior courses, only 13 are segregated—four in French, three in German, two in English, and one each in mathematics, Latin, political economy and history. This is natural, because we believe that coeducation is bound to prevail thru its own inherent righteousness wherever it has a fair chance. What we object to is forcing upon American young people a medieval system based upon a false and foreign idea of the relation of the sexes.

We repudiate the charge that we have slandered the late President Harper by criticizing the reactionary tendencies of the University of Chicago in recent years. We attacked his policy in this matter when he was living, we mentioned it for consistency's sake in the eulogy we published at the time of his death, and we propose to speak of it from time to time in the future so long as the shadow of this policy rests upon the University of Chicago. But we do not overlook the immense services that he rendered to American education, nor do we fail to appreciate his personal character and high ideals. We do not believe that he was enamored of the follies of athleticism, the childishness of ritualism and the narrowness of segregation, to which he, like other college presidents, gave countenance. Those who hold that he was are insulting his memory, not we. Why he permitted these barnacles of the past to fasten upon the university that he had launched we do not profess to know, but we do not doubt that he did it, as he did all things, for the greater glory of the institution, possibly thinking, like many other persons, that they were trivial matters in which one could afford to make concessions.

Nor do we assume the power to fathom the minds and motives of the other advocates of semi-segregation. Some of them have told us in private conversation that they voted for it to get rid of the women; some that they did it for politic reasons; some that they were deceived by the plausible argument that it was really a measure for extending liberty of choice instead of restricting it. But essentially it was a line-up on the question of coeducation, tho we do not think that the final vote represented the relative strength of the parties. Both parties recognized the larger issues involved, in spite of the efforts made to minimize the question to a matter of administrative detail. As a country cannot exist half free and half slave, so a university cannot long continue half free and half monastic. The believers in coeducation realized as soon as the segregation scheme was broached that it was an entering wedge which would eventually rive the university asunder unless it was withdrawn. It was natural that they should credit their opponents with an equal intelligence. All the opponents of coeducation, so far as we know, embraced the plan ardently, altho it was as far from their ideal as from that of the coeducationalists. The misogynists of the students and faculties, mostly young fellows of Eastern or foreign training, exulted that the day was coming when no skirt would be seen on the campus. They obviously meant women's skirts, for men of that sort are usually in favor of collegiate ritualism, and want no rivalry in the wearing of gowns.

THE INDEPENDENT has taken a special interest in the University of Chicago from its foundation, and we have been accused, by the graduates of other insti-

tutions, of praising it too much and of exaggerating its importance. If our criticism of one feature of its policy, or of one group of closely related features, has seemed unduly harsh, it is because of our disappointment that the university has in this particular proved recreant to the ideals and opportunities of its foundation. In its treatment of women it is yet far ahead of such institutions as Harvard and Columbia, with their lean-to female colleges. The new donations from Mr. Rockefeller of $2,917,000 as endowment, and of a pension fund of equal magnitude, open a new career of prosperity and usefulness. We hope that it will seize the opportunity to cast aside the grotesque and hampering trappings it has borrowed from the medieval universities of Europe, and, like its chief rivals, the State universities of the West, apply the principles of liberty, equality and fraternity to the relations of the sexes.

The New Theology According to Mr. Campbell

THAT there is a "new theology," and that it is more and more prevailing, is beyond question, but it has its phases and varieties innumerable. Indeed it is progressive. To the old Calvinistic theology which prevailed in this country for a century after its settlement, Jonathan Edwards made a dozen or two "improvements," purely out of his logic, and his son added to the number. Dr. Emmons taught his people that all "sin consists in sinning," and that none of it is inherited or transferred. The New School Presbyterians, led by Albert Barnes, were driven out of the old Presbyterian Church because they had learnt that the atonement of Christ was general and not limited. And all this was before the advent of modern science and modern criticism.

Since that advent we have moved faster. How fast is shown by the restatements of belief made by Sir Oliver Lodge and the Rev. Reginald J. Campbell, the successor of Dr. Joseph Parker as pastor of the City Temple, now one of the most accepted preachers of Nonconformity in Great Britain. These new views come from different regions of thought. With Sir Oliver Lodge it is scientific conclusions that compel him to modify, or reconstitute, his catechism of faith. With many more it is the studies in ancient history and biblical criticism, led by Robertson Smith, Professor Sayce, Canon Driver and such German scholars as Gunkel and Delitzsch, which require them to take a new view of biblical literature. With yet others it is, as in the days of Edwards, their philosophy which takes them far away from the accepted beliefs of their fathers. Thus, in science, the younger Agassiz cannot defend Scripture in the terms of his father; criticism and history have carried the younger Delitzsch far away from the exegesis of his sainted father; and the pastor of the City Temple in London is driven by his philosophy into a camp which his ministerial father and grandfather would have regarded as heretical.

Mr. Campbell's teaching, which is now so much talked of in England, is based on what he calls the "immanence of God." Now *immanence* has many meanings. When it means *omnipresence,* as with many who use the new word, it is the old rose sweetened with another name. It is something else when it is used to designate the active energy of God in the human soul, as in all external nature. Something else is the definition of it given by Mr. Campbell. We take his language from his last statement of his new theology cabled to us on Sunday.

He says:

"The starting point of the new theology is belief in the immanence of God and the essential oneness of God and man."

That is the starting point for him, not for Canon Driver or Sir Oliver. Just what is meant by "the essential oneness of God and man" he explains, or tries to explain, further. He proceeds:

"The word *God* stands for the infinite reality whence all things proceed. Every one, even the most uncompromising materialist, believes in this reality. The new theology, in common with the whole scientific world, believes that the finite universe is one aspect or expression of that reality, but it thinks of it or him as consciousness rather than a blind force, thereby differing from some scientists. Believing this, we believe that there is thus no real distinction between humanity and the Deity. Our being is the same as God's, altho our consciousness of it is limited."

This may not be very clear to one untrained in the philosophy of immanence, but we may gather something more of it from Mr. Campbell's explanation of what is meant by immortality:

"The new theology, of course, believes in the immortality of the soul, but only on the ground that every individual consciousness is a ray of the universal consciousness and cannot be destroyed. It believes that there are many stages in the upward progress of the soul in the unseen world before it becomes fully and consciously one with its infinite source. We make our destiny in the next world by our behavior in this, and ultimately every soul will be perfected."

So far as we can understand it this is not as pantheistic as it sounds. One thinks of the scientific, but materialistic, monism which—but it is hypothetical philosophy—regards ether, perhaps, as "the infinite reality whence all things proceed," first by rings and whorls in that ether, and gradually develop into all the combinations of crystal and plant and animal and brain-soul. But Mr. Campbell's immanence asserts, postulates—and this, again, is hypothetical philosophy—a consciousness in all this and all other primal existence "whence all things proceed." And this universal consciousness he does not leave dissolved, but he splits it up into separate atoms of consciousness, man, and, we suppose, crystal, but still all retained within the universal consciousness; and he seems to escape the pantheism of the Hindu, whose bubble on the ocean of life finally disappears in the infinite existence, for he tells us that "every individual consciousness is a ray of the universal consciousness and cannot be destroyed." He seems by this to mean that the "ray" remains a separate ray forever, and is not absorbed in the universal source of light.

We would have our readers consider Mr. Campbell's teaching with some sympathy, but rather for his conclusions than his process. The ordinary unphilosophical mind may not be able to understand a teaching which makes his own consciousness definitely individual and at the same time part of a general and universal consciousness. This explanation will satisfy those who can understand it; but for the great number of those who are inclined to a new theology a less abstruse basis and one less ethereal is required. They learn from science and history conclusions of fact, how the earth has been made, how life has developed, how languages have grown, how impossible is the account of the Flood, how primitive beliefs have their place necessarily in the Bible, and out of all these and kindred studies and the growth of purer ethical standards they have been forced to reconstitute to a great extent their theology, but with no great change in their basal faith in the nature as well as the existence of God.

The Proposed Vagrant Law

WHEN the States in rebellion came to the period of reconstruction it was a question for the ruling white people what they should do with their freedmen. They had no idea that they could take care of themselves. They would be a wandering menace, begging and stealing over the country. Laws were proposed or enacted requiring registration and a pass system and severe discipline of vagrants. Every negro that was not registered as in regular employment was to be farmed out to contractors and compelled to work. But this seemed to Congress to be an attempt to re-establish slavery under another name. Accordingly these first attempts of reconstruction, on the system of feudalism or peonage, were suppressed, and the States put under Federal control until a better system, with constitutions that should equally protect all citizens, under the Fourteenth and Fifteenth Amendments, could be organized.

The States have gone thru their period of reconstruction. Since the breakdown of Federal control under the administration of President Hayes, and the full restoration of the power to the white people and the withdrawal of Federal troops, the States have been permitted to make such legislation as they chose, within the forms of the Amendments, and have succeeded in one way or another in suppressing the negro vote. There is not a negro, we believe, in a single State Legislature, even where they are in immense numerical majority, and they have no municipal or county repre-

sentation in office. To speak of the peril of negro supremacy is a joke to make a smile on the face of a Kentucky "Colonel."

But there has arisen a new fear, carefully encouraged and nourished, a fear of negro crime. Of course there is much negro crime and much ignorance; and so there is quite as much white crime and nearly as much ignorance. But now it is proposed, and seriously argued, that the old plan of registering respectable negroes, of whatever quality, be put into law, and that each negro be compelled to carry these registry papers, as passes, with him, so that if a decent, hard-working man he can be allowed to move from one place of employment to another, while others, who have not been able to secure good conduct papers, shall be arrested and punished as vagrants at hard labor. Leading papers are urging such a plan, especially in Georgia, where the other day a *pogrom* against negroes was enacted, with all cruel butchery, following the violent and criminal campaign of the two candidates for the office of Governor. In other States the proposition meets approval, and is likely to be presented in the coming sessions of the legislatures. Doubtless it would contradict the Fourteenth Amendment, but some way may be found to evade that difficulty. It cannot be more difficult than the work of evading that Amendment by the laws that shut the suffrage from the negro without mentioning the word *negro* in the acts. Thus a bill might be drawn up which would, in words, make no distinction of color, but which would be left to the officers to apply, it being understood that it was to apply only to men of color. That has been proved easy in the case of the laws against illiterate suffrage, where these negroes are found too illiterate to understand a clause in the State Constitution, while there are no such white voters that can be discovered so illiterate. This is a very dangerous scheme, but it is no more than was to be expected. For when the freedmen are beginning to secure enough education and property to ask for their legal rights, the opposition of those who would keep them in feudal subjection may be expected to find means of legal expression.

Arbitration in Canada

We are quite willing to have Canada follow New Zealand and Australia in the experiment of compulsory arbitration of labor disputes, and we should be glad to have that experiment tried so near us, where it can be easily under our observation. But the bill proposed by the Canadian Minister of Labor, Lemieux, and which is likely to be enacted, does not go quite so far in form, altho it does in substance. It provides boards of conciliation in labor disputes which shall have power to compel witnesses to appear, and which, after investigation, shall present a decision which the parties will be morally, but not legally, bound to accept. Before such decision neither a strike nor a lockout is to be allowed. Such a plan seems wise and feasible, and it escapes the objections so often made to compulsory arbitration. It is convenient to have small countries which can try experiments which are slow to be adopted in a great nation.

A New Electric Light

Everybody knows that the incandescent electric light, altho far more economical than the gas or kerosene flame, is still very wasteful, because only a small fraction of the total electrical energy consumed is converted into light. Scientists have accordingly been working for years to find some other filament than the carbon now used. Tantalum and tungsten and other rare elements have been proposed, but as they were expensive to get and difficult to handle they have not come into use. Now it is reported that Prof. H. C. Parker, of Columbia University, working with Mr. W. C. Clark, has discovered a new filament which has a greater efficiency than any other and can be made in unlimited quantities at low cost. They call the new material "helion" and state that it is composed of silicon, with other ingredients deposited by the decomposition of a gas on a filament of carbon. With a current sufficient to bring the ordinary carbon filament to a dull redness the new lamp gives a bright light. The ordinary incandescent bulb of 16-candle power requires 55 watts of electric energy, while the helion lamp gives more than one candle power for each watt it uses.

The Pronunciation of Latin

It will be very nearly as easy to persuade the world to talk Esperanto as to agree on an internationally uniform pronunciation of Latin. The Catholic Church, which prays in Latin, bombards Heaven in a dozen different articulations; and so little effort has been made to harmonize them that when the Vatican Council was in session the stenographers had great difficulty in understanding what was said by speakers from various lands. In correcting its former "English" pronunciation of Latin the United States was much in advance of England, whose universities still hold to that pronunciation which Milton called barbarous, saying that it was worse than law French. Even so our schools led the English schools for years in the use of scientific German methods in grammars and dictionaries of both classical languages. At last the English are waking up. The Classical Association had already approved the use of the Continental pronunciation, and now the Conference of Head Masters has voted by 32 to 11 that the reformed system should be adopted in all schools as soon as possible. To be sure, the universities are yet to act; but when the boys go to Oxford all having learned *"Waynee, weedee, weekee,"* the university cannot help itself. To be sure, it will sound very strange to the old Latinists, and they will ridicule it, as did the dean who, when visiting a girls' school which had adopted it, and hearing the girls construe their sentences word by word, professed himself greatly shocked when the miss to whom *vicissim* came read and translated it *"We kissim,* by turns." But, on the other hand, the new pronunciation will lose many chances for Latin-English puns. The Westminster School by its foundation must present a Latin play once a year, and this last month the dialog was full of such jokes. We notice in two lines the Latin words *potato* and *beer,* the joke of which would be lost in the new pronunciation. While the change is generally approved, some excellent scholars are much offended at Kikeronian Latin, and would prefer the softer Italian pronunciation, which *chews* its *c*'s.

The British Rule in India

"Divide and conquer" is an old maxim, and "Divide and rule" is an equally familiar practice, and is likely to have its illustration in India. The "New India" we hear about, and whose cause has been championed by Mr. Bryan, is the India of the Hindu faith, not of the Mohammedans or the million or two Christians or of the Parsees. For years they have been holding congresses, and their motto is "India for the Indians," meaning still those Hindus. Now the Mohammedans begin to speak, and, tho few in South India, they constitute more than half of the population of Bengal. An All-India Mohammedan Educational Conference was held in Dacca during the last week of December, attended by 3,000 delegates, and its first resolution was one "to promote feelings of loyalty to the British Government" while advancing the interests of Mohammedans. The mover of the resolution, the Nawab of Dacca, made his purpose plain in his speech. He declared that the proposed league had been forced upon Mohammedans, who had to prevent mischief from being done by the Congress extremists and to save themselves from being submerged by an enormous and noisy majority of the other race. Nevertheless, the present Liberal Government of Great Britain knows that reforms looking toward larger participation of the natives in Government are imperatively needed, and are desired by both Mohammedans and Hindus, and that the permanence of the British rule depends on their being granted.

Centralization in France

It is a long journey from the day when, in the fifties, the Know-nothings with their secret lodges ruled Massachusetts, and a mob burned a Charleston convent, to these days, when Boston and half a dozen other Massachusetts cities have Catholic mayors, and a big Boston meeting asks the President of the United States to make a protest to France against the law separating Church and State, and Archbishop O'Connell, in his address at Faneuil Hall, says that "if the Pope had the physical means to defend his rights, France could never have dared

such an open affront and open breach of faith." This is startling language. Would the Archbishop, who is now associated with the peaceful and beloved Archbishop Williams, have the Pope surrounded by armies and make war on nations which offend him? We can see no attempt to wrong the Pope, altho we do not like all the minor details of the law. But we remember that in Continental Europe the Government has a way of overseeing everything which is foreign to our notions; and centralization is the policy, whether in empire or republic. And of all institutions the Catholic Church is most centralized. The bishops were ready to accommodate themselves to the separation law, but had to obey the Pope. And now, in the French Church, the bishops are telling the faithful that they must not make plans to support their own local priests and worship, but must send all the funds collected to the bishops, who will take the matter entirely in their own charge. Thus episcopal centralization rules the priests, and Papal centralization rules the bishops, just as administrative centralization rules the civil state. We do things differently. Here the city or county controls its local matters, and each Catholic priest raises his own funds, and all are content. And so is France content with her own way.

In certain Southern States the people find it hard to understand why immigrants from other lands are slow to settle among them. Perhaps the managers and foremen of a lumber company of Alabama may enlighten them. It was proved that the managers and foremen had been guilty of horrible peonage. They had hired foreigners in New York and taken them down South, held them in camps under drivers, chased them with bloodhounds when they tried to escape, and savagely beaten them, just as if they were negroes in a convict camp. And then immigration committees wonder that Italians and Germans choose to settle elsewhere.

Mr. Carnegie again definitely expresses his belief that the people are the partners of the millionaire, and that the people should take a share of his wealth at his death. And that share, he says, should be a large one, and graduated in increasing proportion to the extent of the dead man's fortune. He would not allow fortunes to be accumulated from one generation to another, to the danger of the people. We are now beginning to have that same fear of having a controlling portion of the wealth of the country in a few hands which has caused the sequestration of inordinate ecclesiastical wealth in such countries as France and Mexico.

Conditions look ominous for the Governments of both Germany and Russia in the new elections. The Kaiser's threat to remove his court from Berlin to Potsdam in case Berlin goes against his policy will hardly frighten the people. It would even more estrange the people who know that it is they and not the Emperor to whom belongs the right to rule. In Russia one official after another is being killed, and terror rules, while the Czar is vainly trying to control the membership of the coming Duma. There may be yet a chance for Count Witte, whom now the absolutists detest for his creation of the Duma.

The peace prizes' infection is spreading this way. The Association of International Conciliation, having its headquarters in Paris, with Baron d'Estournelles de Constant as president, has sent medals of honor, for their part in promoting international good will, to President Roosevelt and Secretary Root, to Andrew D. White and Seth Low, American members of the Hague Conference; President Butler, of Columbia; Congressman Bartholdt and Mr. Hayne Davis.

A Maryland correspondent tells us that the later investigation shows that it was not students of a local college who were guilty of the late lynchings at Annapolis, as was at first reported. He says—and we agree with him—that one excuse for lynching would be removed if the testimony of an innocent victim in the case of outrage upon a woman could be given privately so as to avoid the public shame to her. Such a law should be enacted.

The Metropolitan Life and Negro Insurance.

SEVERAL weeks ago the daily newspaper press contained the erroneous announcement that the Metropolitan Life Insurance Company, as the result of an unfavorable mortality experience on negro lives, had decided to discontinue the issuance of policies to that class of persons. The statement was promptly contradicted by President Hegeman, who, later, in a communication to us, says that no instructions declining applications for insurance on the lives of colored people have been issued to agents of the company, and that such applicants have the same rights to insure in the Metropolitan they have always had.

THE INDEPENDENT takes great pleasure in making this correction and in presenting the facts, for currency was given the erroneous statements on this page not long since. The announcement respecting the alleged change of attitude toward negro lives was brought to our attention; but President Hegeman's subsequent correction escaped us. In our efforts to account for a much regretted blunder we have carefully reread such authoritative announcements as have issued lately from the Metropolitan office, and we rather incline to the opinion that the whole misunderstanding originated from a hurried and careless reading of that portion of President Hegeman's Bulletin of December 8th, 1906, where, in referring to the improvement in mortality experience during the period 1896-1905, the observation occurs:

"It seemed to us wise to examine separately our experience of white and colored lives. We found a very remarkable improvement among the whites, the experience among the blacks showing less improvement in the infantile ages and no improvement at all in most of the adult ages."

Then, passing to the conclusion that the construction of new tables of mortality seemed desirable, occurs the subsequent conclusion that "it seems just to base these tables upon the experience of white lives." Instead of an abandonment of the negro as a subject of insurance, as incorrectly announced in the press, therefore, the experience on white and colored experience are to be segregated and the new mortality tables are to be based on the white experience only.

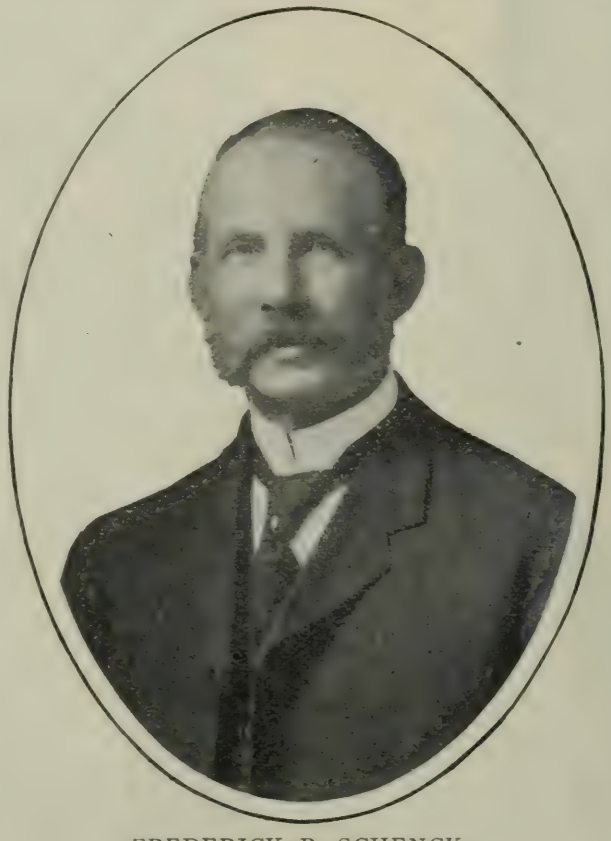
There are other matters of much interest in this Bulletin. As everybody knows, the Metropolitan is not a mutual company and the great bulk of its policies, including all the industrial policies, are issued at "stock rates," that is, at such premiums as generally preclude the possibility of dividends. As a consequence, the policy contracts contain no provisions for dividends to policyholders. Notwithstanding this, the business has been so skilfully managed and the mortality has enjoyed so constant a diminution from that assumed, that the company has been enabled to save money out of the rates paid. While not contracting to do so, the Metropolitan seems to have thought it but just to return some of these savings to the policyholders voluntarily, with the result that during the past twelve years it has distributed ten millions of unpromised dividends, the figures during 1906 running close to two millions.

As the result of the new mortality experience previously referred to, the company proposes, during 1907, making such changes in its rates and policy contracts as will result very profitably to policyholders. Among these new provisions we find in the industrial class: cessation of all premium payments at age 75; substantial reduction in premium rates, the new infantile table providing for nearly as much insurance at death for a premium of 5 cents a week as was formerly provided for 10 cents a week; an increase of benefits at older ages, ranging from 12½ to 18 per cent. at age ten, 9 to 23 per cent. at age 20, 6 to 20 per cent. at age 30, 2 to 13 per cent. at age 40 and so on.

Conforming to the new law establishing standard forms of policies, the Metropolitan informs the public that its new policies will contain all the advantages and concessions it can afford to give, including generous surrender values, or their equivalents in extended or paid-up insurance.

Reviewing the business of 1906, which was a most unfavorable one for all life insurance companies, President Hegeman expresses entire satisfaction with the results, the progress of the company being

unimpeded, as is proven by the fact that the largest business in the history of the company was done. The early months of the year only reflected the depression consequent upon the Armstrong Investigation, the agency force responding promptly during the last half to the management's appeals to overcome the unfavorable results.



A new enterprise on the part of the Metropolitan Life which is of great interest outside of insurance circles is the tower extension to their present building. The building as it will appear when finished is reproduced herewith. The tall tower will stand on the corner of Madison avenue and Twenty-fourth street in the northwest angle of the block, where the Gothic tower and steeple of the Madison Square Presbyterian Church (Dr. Parkhurst's) lately stood. The following details as to specifications will give some idea as to what the building is to be, viz.: Hight above sidewalk, 658 feet; total hight from foundation, 690½ feet; number of stories above sidewalk, 46; number of stories below sidewalk, 2; grand total floor area of new Metropolitan Building, 1,035,663 square feet (about 25 acres). This skyscraping tower has been planned to defy gales, and it is claimed that the problem of skyscraper construction has been so perfectly mastered and wind-braces have been so skilfully introduced that the lofty column will have all the power of resistance belonging to the main building.

Financial

Liberty National Bank

FREDERICK B. SCHENCK was last week elected president of the Liberty National Bank. Mr. Schenck has an enviable reputation among bankers as a man of the highest character and of sound executive ability. His career in the Mercantile National Bank thru different positions up to the cashiership and presidency make his services invaluable to any financial institution. Mr. Schenck belongs to a family of bankers, one of his brothers being Edwin S. Schenck, president of the Citizens Central National Bank, and another, Henry A. Schenck, comptroller of the Bowery Savings Bank. James V. Lott, formerly cashier of the Mercantile National Bank, has become cashier of the Liberty National Bank, and the vice-presidents are Charles H. Stout, Charles W. Riecks and Daniel G. Reid. Its former presidents have been Henry C. Tinker, Henry P. Davison and Edmund C. Converse. The Liberty National Bank was incorporated October 15th, 1891, with a capital of half a million and no surplus. In 1901 the surplus had grown to over a million dollars, so that the half million capital was increased to one million. Today the capital is one million and the surplus is a million and a half, and undivided profits $724,933. Dividends of 20 per cent. were paid on the old capital and were afterward increased to 16 per cent. on the new capital. The dividends are now at the rate of 20 per cent. The deposits are over eleven million dollars.

FREDERICK B. SCHENCK.

....Joseph B. Martindale, who came to New York in 1878 and has filled with credit many positions in the Chemical National Bank, of which William H. Porter is president, was last week elected vice-president and director. Mr. Martindale became credit clerk in 1899 and assistant cashier in 1902. H. K. Twitchell, assistant cashier of the Chase National Bank, has been selected as assistant cashier of the Chemical.

....Fisk & Robinson, the well known bankers of New York and Boston, in the January number of their Bulletin of Investments, publish a useful review of the Treasury Department's dealings with the national banks in 1906, together with a record of the year's Government bond issues, remarks upon the rates for loanable capital here and abroad, and references to the year's important events in the field of finance.

....The Fourteenth Street Bank has elected Richard I. Brewster second vice-president, in place of George F. Vail, who, owing to ill health, has resigned. The other officers are R. Ross Appleton, president; John F. Carroll, first vice-president, and P. M. Sayford, third vice-president. The growth of the Fourteenth Street Bank has been rapid. Its deposits are now nearly $8,000,000; its capital will be increased in February from $500,000 to $1,000,000.

....William H. Rogers, who in March next will have completed fifty years of service in the Nassau Bank, was last week elected vice-president.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Earthquake and Fire in Jamaica

Kingston, the chief city of the island of Jamaica, was shaken by an earthquake at 3:30 p. m. on the 14th. Fire followed the shock, which had broken the water mains and thus prevented the firemen from checking the progress of the flames. The business part of the city was destroyed. Governor Swettenham said in his report that the burned district was about one-thirtieth of the city's area, being a triangular tract with its apex at the old Parish Church and extending from the Parade Gardens to the sea, between Duke and Princess streets. Other and trustworthy accounts show, however, a greater loss. The shock was quite severe within a radius of ten miles. In the city there is scarcely a building in sound condition. Nearly all the churches, banks and public buildings were burned. The Myrtle Bank Hotel was destroyed, and the bodies of many guests are believed to be in the ruins. Few of the wharves are left. The harbor has been deepened, and the water front appears to be slipping down into the sea. On the sand spit which guards the inclosed harbor were the remains of the old city of Port Royal, the greater part of which was submerged long ago by an earthquake. Here the lighthouse was thrown into the sea on the 14th, the fortifications were submerged, and two gunners were drowned. Shipping was not injured, except that the tourist steamship "Prinz Waldemar" ran ashore for lack of lights. At the military station in the suburbs, the camp hospital collapsed and was destroyed by fire, and forty-six soldiers in it were burned to death. Among the dead there are Major Hardyman and Lieutenant Lamont. The Constant Springs Hotel was injured, but not destroyed. There was but little damage at Port Antonio, where a hundred American tourists were in one of the hotels. A tidal wave was reported at Annotta Bay, on the north side of the island. Early dispatches underestimated the loss of life in Kingston. At last reports more than 600 bodies had been buried or cremated, and it is probable that 900 or 1,000 persons were killed. A great majority of these were negroes. The most prominent of the whites who lost their lives was Sir James Fergusson, a visitor, who had been Governor of South Australia and New Zealand, and for a time was Postmaster-General in the British Cabinet. He had been lunching at the Jamaica Club with Governor Swettenham and was killed in the street by falling walls. The clubhouse was demolished. A large party of prominent Englishmen, led by Sir Alfred Jones, chairman of the Liverpool Chamber of Commerce, and interested in the cotton trade, escaped death, but several of these visitors were saved almost by miracle. The party included the Earl of Dudley and half a dozen members of Parliament, one of these being John Henniker Heaton, who sent to London a long report of the disaster. Among the dead are Captain Constantine and Captain Young, of a steamship company; A. M. Nathan and Charles Sherlock, the leading merchants; the Cuban Consul, the Spanish Consul and three physicians. It is said that 120 men were killed in one cigar factory and ninety children in a large schoolhouse. Reports have been delayed and are conflicting. Cable offices and land telegraph lines were wrecked. The first dispatches were sent on the night of the 15th from Holland Bay, at

the east end of the island. Nearly all of the dispatches say that no American tourist or visitor was killed. During the panic which followed the shock, hundreds of negroes were praying in the streets. Many ran into the sea, and some of these were rescued by parties from the ships. Hospitals were improvised on the ships, and scores of amputations took place there. From Guantanamo, the American destroyer "Whipple," the battleships within a few days, that a great eruption is in progress at Mauna Loa, in Hawaii, and that an increase of activity at Mount Etna is reported.——Last Monday morning it was learned with surprise and indignation in this country and in London that Rear Admiral Davis and the American warships had left Kingston on Saturday afternoon, having practically been driven away by Sir James Alexander Swettenham, Governor of the island.

KINGSTON, JAMAICA.
This picture was taken from a boat just off the chief Jamaica docks.

"Missouri" and "Indiana," and the supply ship "Celtic" hurried to Kingston. These American ships were the only naval vessels in the harbor, and they were of great service. American marines were landed and placed on guard. At Washington, Congress passed a bill authorizing the use of naval supplies for the people of Kingston. All this was appreciated in London. On Friday two shots (blank cartridges) were fired from one of our ships in the direction of the penitentiary as a warning to prevent a threatened revolt of the prisoners. It is noticeable that earthquakes have taken place elsewhere Altho marines had been landed at the request of the Governor or of his representatives, and had done excellent service, he decided that they must be withdrawn. He made known his decision to Rear Admiral Davis in an extraordinary letter, abounding in sneers and insults. In the opinion of the American commander, to leave the harbor was the only course consistent with the dignity of the United States. He was urged to remain by the City Council, which, at a special meeting, expressed disapproval of the Governor's attitude. Withdrawal of the naval sur-

geons and medical supplies will cause much suffering. Governor Swettenham is severely criticised by the London press.

Prosecution of Trusts

At Findlay, O., the grand jury of Hancock County on the 14th brought in 939 indictments against the Standard Oil Company of New Jersey, the Standard Oil Company of Ohio, several subsidiary companies in that State, John D. Rockefeller, William Rockefeller, H. H. Rogers, H. M. Flagler, John D. Archbold and other officers of the corporations involved. All are accused of violating the State's Anti-Trust law by maintaining a combination to prevent competition in the manufacture, sale and transportation of petroleum. Prosecutor David says that in these indictments the objections of the Standard's counsel to other recent indictments have been met and that the claims of counsel as to the proper course of procedure have been satisfied. In case of conviction, the fines and costs may exceed $60,000,000, and the individual defendants may be sent to jail.——Fines amounting to $18,000 have been imposed upon the two companies controlled by the Tobacco Trust which were found guilty in New York, on the 10th, of violating the Sherman Anti-Trust law.——Following a speech by Senator Kittredge, in which he attacked what has been called the Lumber Trust, the Senate, on the 18th, passed a resolution directing that an investigation be made by the Department of Commerce and Labor. It is understood that such an investigation has been in progress for several months.——In Arkansas, the Supreme Court has upheld the imposition of a fine of $10,000 upon one of the meat packing companies for refusing to testify in Chicago in a Trust suit brought by the Attorney-General of Arkansas.

San Francisco and the Japanese

To enforce the provisions of the treaty with Japan the Government, on the 18th, began two suits in San Francisco. In the Supreme Court of the State it asks for a writ of mandamus to compel the admission of a Japanese child (in whose name the suit is brought) to the public school from which he was excluded. In the Federal Circuit Court it has filed a bill in equity, asking that the State law be construed, that declaration be made that this law is not applicable to Japanese children, and that the defendants (the Board of Education, Superintendent of Schools, and principals of schools) be enjoined from excluding Japanese children. In both suits the Government alleges that the treaty has been violated. In the treaty the privileges and rights of the most favored nation, "in whatever relates to rights of residence and travel," are given to the Japanese. It is expressly provided by the State that every school in a district must be open to all children of school age resident within said district. The right to attend such schools, the Government contends, is one of the "rights of residence" guaranteed by the treaty. The Government also points out that it has assisted in supporting the schools of California, having granted 5,000,000 acres of public land for that purpose, and having, in June last, by act of Congress, and for the same purpose, given to the State 5 per cent. of the net proceeds of the sales of public land in the State since California's admission to the Union—all with the understanding that the schools should be conducted in obedience to the Constitution, which makes treaties the supreme law of the land. It is also asserted by the Government that Japanese are not in any sense "Mongolians" (to which the law refers), but are a distinct race, and that until a short time ago this was conceded by the authorities of the State. Therefore the law, if properly construed, does not justify the acts of the Board of Education, and if it does it is null and void, being in conflict with the treaty.——An association has been formed in Tokio to cultivate commercial relations and develop navigation between Japan and the Philippine Islands, and also to found a Japanese bank and a Japanese insurance company in Manila, where it will publish a newspaper.——In the last six months, about 11,000 Japanese have arrived in the Hawaiian Islands, and 5,000 of these, after some delay, have been carried to the Pacific Coast States.——A new Chinese Exclusion bill

has been reported to the House Committee on Foreign Affairs from a sub-committee. It is not satisfactory to either the Pacific Coast Representatives or to the Chinese Minister. It provides for an examination and the issue of certificates by American inspectors in China to persons of the exempt classes, and aims to prevent harsh treatment of such persons upon their arrival. The Chinese Government, it is said, desires that persons of the exempt classes shall be required to prove, not that they belong to one of these classes, but merely that they are not coolie laborers.

The Panama Canal

A report from the Commission, together with a cable message from Chief Engineer Stevens, appears to prove that the rumors about unfavorable results of the borings on the site of the proposed Gatun dam were without foundation in fact. The report says that sixty-three borings have been made on the site of the dam, and that pervious material was found at the bottom in only four of them. All of the 127 holes bored on the adjoining sites of the proposed locks show that the lock walls will rest upon a foundation of "firm and suitable soft rock." No extraordinary difficulties have been encountered to cause a change of plans, and nothing has been found, it is asserted, to affect the practicability or permanence of the great dam.——The Government has not yet decided to award the canal contract to Oliver & Bangs, the lowest bidders, who propose to do the work for 6¾ per cent. of the money expended. Pierce & Co., next on the list, whose bid was 7.19 per cent., have withdrawn from the competition, but argument has been heard in behalf of the third bidder, the McArthur-Gillespie Company, whose offer was 12½ per cent. It is understood that the Government will not pay so much as that, but the competition would probably be reopened if the bid of Oliver & Bangs should be rejected. It remains to be shown conclusively that Oliver & Bangs have sufficient capital and that their record, as to work heretofore done for the Government, is good. The record of Mr. Bangs (who has not been associated with Mr. Oliver) is said to be unsatisfactory with respect to work now in progress. Concerning work in the past, it is asserted that his connection with the projects of Gaynor and Greene at Savannah and elsewhere is severely criticized. On account of fraud in those projects, Captain Oberlin M. Carter was sent to the penitentiary. Mr. Bangs is a brother-in-law of Gaynor. At the trial of Carter, the Government asserted that he had been used as a nominal bidder in the interest of Gaynor and Greene, and that some of their contracts stood in his name. If the canal contract should be awarded to Oliver & Bangs, Mr. Oliver would probably employ at least 5,000 negroes from the Southern States. He is willing, he says, to employ negro convicts.

Washington Topics

Debate in the Senate upon the various resolutions concerning the President's dismissal of the negro soldiers has been marked by some asperity. Among the speeches last week was an eloquent one by Mr. Spooner, who upheld the President's authority to order such dismissals, considered the race question, and temperately but keenly criticised Mr. Tillman for his public utterances in denunciation of negroes and in commendation of lynching. Mr. Carmack, being on the side of the President in this matter, suggested that the leaders of his party, really hostile to him because he had forced great corporations to obey the laws, were now striving to destroy his influence and to renew the party's "covenant with the plunderers and oppressors of the American people." It is said that by a majority of the Republicans the President's action is disapproved. On the 17th, when the pending resolution was one calling for a Senate investigation of the Brownsville affray, and saying nothing about the soldiers, Mr. Blackburn offered an amendment declaring that the purpose of the investigation was not to question or deny the legal right of the President to discharge enlisted men of the army without honor. It was understood that this would be supported by a majority composed of all the Democrats (except Mr. Tillman) and

about twenty Republicans. Attempts were then made to unite the Republicans in support of a new compromise resolution, and on the 21st such a resolution was introduced by Mr. Foraker, who had been the leading opponent of the President. In this resolution, which was accepted by Mr. Blackburn (for the Democrats), and which had been approved at Republican conferences, the Senate directs, "without questioning the legality or justice of any act of the President in relation thereto," that an investigation of the affray at Brownsville be made.

Diversion of Niagara Water

Exercising the power given to him by the Burton act, Secretary Taft has issued permits authorizing the importation into this country of 160,000 horse-power of electric force from power companies on the Canadian side at Niagara Falls, this quantity being allotted as follows: Ontario Power Company, 60,000; Electrical Development Company, 46,000; Canadian Niagara Falls Power Company, 52,500; International Railway Company, 1,500. The Ontario company, whose power house is just below the Falls on the Canadian side, is now transmitting power to Syracuse, about 165 miles. He also decided to permit a diversion of water on the American side as follows: Niagara Falls Power Company, 8,600 cubic feet per second; Niagara Falls Hydraulic Power Company, 6,500 feet; Erie Canal, 400 feet. He has reached the conclusion, he says, "that with the diversion of 15,500 cubic feet per second on the American side, and the transmission of 160,000 horse-power from the Canadian side, the scenic grandeur of the Falls will not be affected substantially or perceptibly to the eye." He has appointed a committee (consisting of Charles F. McKim, Frank D. Millet and F. L. Olmsted) to advise him as to what changes should be made to remedy the unsightly appearance of the American side of the cañon, just below the Falls, where water used by manufacturers pours out thru orifices in the wall. Those who use this water must "remove the eyesore" if they want to retain their permits.——The Canadian Government has introduced in Parliament a bill designed to prohibit the exportation of power generated at the Falls unless and until all demands for it in Canada shall have been satisfied.——It has been recommended by the International Waterways Commission that our Government prohibit the diversion of more than 10,000 cubic feet per second of Lake Michigan water for the Chicago drainage canal.

French Affairs

Premier Clemenceau has again showed his power and promptitude in preventing street rioting on Sunday, January 20th, when a demonstration was planned by the labor unions and Socialists to compel the closing of stores on Sunday. The new law enjoining a weekly day of rest for employees allows some option to the employers as to which day shall be selected for a holiday and whether the establishment shall be closed altogether on Sunday. The efforts of the labor unionists to enforce a general Sunday closing have caused frequent local disorders and several lives have been lost in raids upon stores which persisted in keeping open on Sunday. On Friday and Saturday a forecast of what was likely to happen on Sunday was given by the wrecking of a bakery and a printing establishment which had been keeping open. At Fougeres a woman was attacked by a mob of strikers because she persisted in working. The labor leaders planned to assemble the different unions at their headquarters and march them with banners to the Place de la Republique, whence they were to march thru the boulevards. The demonstrators did not apply to the Government for authorization of the parade, and Premier Clemenceau notified the leaders in advance that such a parade would not be permitted. He took the same precautions that he had found effective in preventing the riots planned for Labor Day, May 1st. Troops were placed on all the streets leading into the Place de la Republique, and wherever a parade started it was at once cut off by the police. Ditches and obstructions in the streets were removed and the pavement sanded, so the cavalry could charge. The differ-

ent forces were kept in communication by the bicycle police, and M. Lepine, the energetic Prefect of Police, was as usual to be found at any point where a mob was beginning to collect. The labor exchange where the unions meet was closed at noon. As the result of these precautions there was little disorder.——The Third Plenary Council of the Catholic Church was held in Paris at the Château de la Muette, January 16th, and was attended by eighty prelates. The Council was opened with the chanting of "Veni Creator." The sessions were secret, and little is certainly known of the proceedings. For fear that the Government would tamper with the communications, the messages to Rome were not entrusted to the mails or even sent as cipher telegrams, but despatched by personal courier to the Pope. The reply to the Papal Encyclical was made public. The Council thanks His Holiness for the Encyclical and declares its entire accord with the principles there laid down. Bishops protest against the violation of the most sacred rights of the Church, and declare that religious peace can only be restored by respect to the rights of the hierarchy, the inviolability of property and full religious liberty. No concessions were made to the Government. Cardinal Coullie, Archbishop of Lyons, is reported to have said that it would be acting contrary to the will of the Pope to come to any settlement on the questions in dispute, because there could be no solution until the Government turns to Rome. The law, he said, is already impracticable and ineffective, and the Government has been compelled to modify the law. In many cases the priests who were arrested for not making declarations of their intentions to hold public services have been acquitted.——M. Briand, Minister of Education and Public Worship, will ask for a law which makes it optional with the priests whether they shall make a declaration for public meetings or not. In case such a declaration is made the ecclesiastic will be under the protection of the law. If not, he will have no legal title. At Beaupreau, near Angers, the students of the Catholic Seminary barricaded the building and defended themselves against the troops who were sent to expel them. The soldiers finally forced an entrance to the building, but a number were injured by stones and other missiles.

What France Pays for Religion

In response to inquiries instituted by THE INDEPENDENT, at the Ministry of the Interior and the Ministry of Finance in Paris, and thru the courtesy of these departments which we are glad to acknowledge, we are able to give our readers an exact official account of the annual amount and the distribution of the French budget for religious purposes up to the present year. These figures show not only the amount saved by the Government and the amount which must be approximated by the different religious bodies, but also the relative strength of the different official Churches and the distribution of allowances in the Roman Catholic hierarchy. Taking first the Catholics, we find 28,705 officiating priests. Of these 851 are 75 years old and receive $253.50 a year; 968 are from 70 to 75 years old who receive $234; 4,300 are from 60 to 70 years and receive $214. There are 22,587 priests under 60 years, of whom 4,000 receive $195 each and the rest but $195 a year. The *curés* come next above in grade. There are in all 3,434, and their pay ranges according to class and to age from $234 to $312 yearly. The curé of the Cathedral of Paris alone receives $468. The Vicars General number 182. The Vicar General of Paris receives $877; 17 receive $595, and 164, $487 a year. There are 52 bishops receiving $1,950, and 16 archbishops who receive the highest pay, $2,925. The whole number of functionaries in the Catholic Church receiving allowances from the State is 32,389, and the total amount of the budget for the Catholics is 40,431,395 francs or $7,884,122. In this sum is included allowances for pensions, grants for work and diverse expenses. In the Protestant establishment are two branches. There are 635 ministers of the Reformed Church and 61 of the Lutheran. The pastors of these Churches are rated with reference to pay in three classes. Those at Paris, 12 of the Reformed Church and 10 of the Lutherans, receive each $585. Those out-

side of Paris of the first class receive $429. Ministers of the second class receive $390, and those of the third class, $351. There are 423 Reformed ministers paid at the latter rate and 40 of the Lutherans. The full amount expended for the Protestants including various expenses is $304,590. The total number of Jewish rabbis is not given; but the amount spent for that religion is $31,888. The overwhelming predominance of the Roman Catholic clergy is seen in these figures. In considering the small amounts paid to the priests it must be remembered that they have had the free occupation of ecclesiastical residences, as well as seminaries and other institutions. Allowance is made for the home life of the Protestants in giving them a larger average salary per year. On the other hand there being no hierarchy in the Protestant Church there is a discrimination against it in paying the vicars general, the bishops and the archbishops much larger sums in addition to Episcopal residences. The total amount of the budget for the three established Churches was, last year, $8,220,600. According to the moderate scheme of the Government the budget will be reduced the next year to $5,752,500; the second year to $5,265,000; the third year to $4,095,000; the fourth year to $3,900,000; the eighth year $2,340,000. But the refusal of the Vatican to accept the Separation law will reduce this sum largely.

Spain

The conflict between Church and State in Spain is assuming a violent form. Catholic demonstrations are being held in various cities which are attacked by anti-clerical mobs and often result in bloodshed. Cardinal Sancha y Hervas, Archbishop of Toledo and Primate of Spain, has presented to King Alfonso the protest of the entire episcopate against the proposed law regulating religious associations. He states that if the law is adopted it will lead to cruel conflicts of conscience, not only among the faithful, but also among the bishops and clergy, because they could not comply with it without becoming guilty of mortal sin and incurring excommunication. All efforts to induce the King to espouse the cause of the Church have proved fruitless. He maintains a strictly constitutional attitude and refers all petitions and communications on the subject to his ministers. The King has offended the Catholic party by permitting the opening of the Protestant Chapel in the palace for the Princess Henry of Battenberg, who is at Madrid pending the confinement of her daughter, Queen Victoria. The Premier, Marquis de la Vega de Armijo, is assured that he will have the support of the Liberal Party in the Cortes which meets on January 21st. Three important measures will be proposed by the Government, the reform of the excise duties, a law regulating religious associations, especially for the purpose of bringing under legal control the friars who have been expelled from France, and the amendment of the penal code in order to provide more efficient means for the prevention and repression of anarchism in Spain. The trial of the men who were arrested for complicity in the attempted assassination of King Alfonso on his marriage day, May 31st, has begun and is assuming considerable political importance. Morral, who threw the bomb at the carriage of the King, committed suicide when he was arrested, but Senor Jose Nakens, editor of El Matin, who concealed him and assisted him to escape, and Senor Ferrer, director of an anarchist school at Barcelona with which Morral was connected, are charged with being accomplices. The Radical and Anarchist parties are making a determined attempt to secure their acquittal. The Public Prosecutor demands that the prisoners shall be tried by three judges without a jury on the ground that the crime being attempted regicide does not come under the ordinary court proceedure. It is feared that if a jury trial is held the accused men will be acquitted.

The Crowning of the Shah

The coronation of Mohammed Ali Mirza on January 19th was a scene of unusual splendor, since it took place in a palace crowded with Oriental treasures, and the Peacock Throne is the most costly piece of furniture in the world. The procession entering the throne room was led by the younger brother of the Shah, and the Persian

officials and diplomatic representatives formed a circular group around the Shah. As he took his seat upon the throne the Prime Minister advanced and placed on his head the jeweled crown, while the Chief Mullah intoned a chapter from the Koran. After an ode by the poet laureate, the Shah descended and received the congratulation of the foreign representatives. Malik Mansour Mirza, the second son of the late Shah, who was in attendance on his father during his illness and was ordered out of the room by Mohammed Ali when he reached Teheran, attempted to commit suicide by taking opium on account of his disappointment in not succeeding to the throne of Persia. The political disposition of the new Shah is still in doubt; the latest rumor coming from Berlin being that he would favor German influence in Persia to counteract the Russian and British power.

The Science of Life Saving

Modern medical science saves 19,000 lives every year in the city of Paris alone; 10,000 of these are babies under five years. This is the conclusion Dr. Jacques Bertillon comes to after a thoro study of the Parisian vital statistics of the past century. If the death rate of 24.4 per thousand inhabitants prevailed now as it did in 1860 there would be 66,434, whereas there are in reality only 47,843. At the beginning of the nineteenth century the death rate in Paris was 32, and its decline was slow until about 1885, when more attention began to be paid to direct experimentation and research and the application of scientific principles to personal hygiene and public sanitation. The greatest triumph of the new methods has been in the care of children. In the last fifty years the death rate of children under five has fallen from 158 to 55 per thousand living. For children between five and ten it has fallen from 13 to 5, and for those between 10 and 14, from 7 to 3. Next to children's diseases, the greatest progress has been made in the prevention and treatment of typhoid fever, diphtheria and diseases of the respiratory organs. It will be observed that all these diseases which have to a certain extent been conquered are due to bacteria whose life history is known and whose influence can be directly counteracted. That the decrease in mortality is due to newly acquired knowledge of our microscopic enemies, not to improvement in general good health and promiscuous sanitation is shown by the fact that the death rate from tuberculosis, which is still imperfectly understood and for which no specific remedy is known, has not decreased very much, while cancer, of which neither the cause nor cure is known, has in the same period become more common and fatal. No wonder that when the French people were recently called upon by a popular journal to vote for the greatest man their country had produced they placed Pasteur, to whom we owe the beginnings of our knowledge of bacteriology, far ahead of Napoleon and Hugo.

The School Controversy in Germany

The land of Luther too has its school controversy, the point at issue being the control of the public schools by the Church and its representatives. The controversy was fairly launched about a year ago when the Teachers' Conference of Bremen, consisting of some 600 teachers of public schools, almost unanimously demanded that the Church be excluded from the school, and that all but an undogmatical religious instruction, consisting of the general principles of international morality, exclusive of specifically Christian principles, be excluded from the school. Several months ago came the Munich National Teachers' Conference, which did not indeed endorse the demand for a total secularization of public school instruction, but declared itself in favor of the "Simultan" schools, *i. e.*, schools attended by children of all religious creeds, who receive whatever religious instructions are given separately. The Prussian Government has given great offense to the friends of non-confessional schools by its new law, which, it is claimed, places the schools in the power of the Church more than ever before.

What It Means to Be Colored in the Capital of the United States

[The special interest in the present article rests in the fact that it describes conditions in Washington, a city governed solely by the United States Congress. It is our only city which represents the whole country. It lies between the two sections, North and South, and it has a very large negro population. The article is timely now that Senator Foraker has brought before the Senate the dismissal without honor of the negro battalion. The writer is a colored woman of much culture and recognized standing.—EDITOR.]

WASHINGTON, D. C., has been called "The Colored Man's Paradise." Whether this sobriquet was given to the national capital in bitter irony by a member of the handicapped race, as he reviewed some of his own persecutions and rebuffs, or whether it was given immediately after the war by an ex-slave-holder who for the first time in his life saw colored people walking about like freemen, minus the overseer and his whip, history saith not. It is certain that it would be difficult to find a worse misnomer for Washington than "The Colored Man's Paradise" if so prosaic a consideration as veracity is to determine the appropriateness of a name.

For fifteen years I have resided in Washington, and while it was far from being a paradise for colored people, when I first touched these shores it has been doing its level best ever since to make conditions for us intolerable. As a colored woman I might enter Washington any night, a stranger in a strange land, and walk miles without finding a place to lay my head. Unless I happened to know colored people who live here or ran across a chance acquaintance who could recommend a colored boarding-house to me, I should be obliged to spend the entire night wandering about. Indians, Chinamen, Filipinos, Japanese and representatives of any other dark race can find hotel accommodations, if they can pay for them. The colored man alone is thrust out of the hotels of the national capital like a leper.

As a colored woman I may walk from the Capitol to the White House, ravenously hungry and abundantly supplied with money with which to purchase a meal, without finding a single restaurant in which I would be permitted to take a morsel of food, if it was patronized by white people, unless I were willing to sit behind a screen. As a colored woman I cannot visit the tomb of the Father of this country, which owes its very existence to the love of freedom in the human heart and which stands for equal opportunity to all, without being forced to sit in the Jim Crow section of an electric car which starts from the very heart of the city—midway between the Capitol and the White House. If I refuse thus to be humiliated, I am cast into jail and forced to pay a fine for violating the Virginia laws. Every hour in the day Jim Crow cars filled with colored people, many of whom are intelligent and well to do, enter and leave the national capital.

As a colored woman I may enter more than one white church in Washington without receiving that welcome which as a human being I have a right to expect in the sanctuary of God. Sometimes the color blindness of the usher takes on that peculiar form which prevents a dark face from making any impression whatsoever upon his retina, so that it is impossible for him to see colored people at all. If he is not so af-

flicted, after keeping a colored man or woman waiting a long time, he will ungraciously show these dusky Christians who have had the temerity to thrust themselves into a temple where only the fair of face are expected to worship God to a seat in the rear, which is named in honor of a certain personage, well known in this country, and commonly called Jim Crow.

Unless I am willing to engage in a few menial occupations, in which the pay for my services would be very poor, there is no way for me to earn an honest living, if I am not a trained nurse or a dressmaker or can secure a position as teacher in the public schools, which is exceedingly difficult to do. It matters not what my intellectual attainments may be or how great is the need of the services of a competent person, if I try to enter many of the numerous vocations in which my white sisters are allowed to engage, the door is shut in my face.

From one Washington theater I am excluded altogether. In the remainder certain seats are set aside for colored people, and it is almost impossible to secure others. I once telephoned to the ticket seller just before a matinee and asked if a neat-appearing colored nurse would be allowed to sit in the parquet with her little white charge, and the answer rushed quickly and positively thru the receiver—NO. When I remonstrated a bit and told him that in some of the theaters colored nurses were allowed to sit with the white children for whom they cared, the ticket seller told me that in Washington it was very poor policy to employ colored nurses, for they were excluded from many places where white girls would be allowed to take children for pleasure.

If I possess artistic talent, there is not a single art school of repute which will admit me. A few years ago a colored woman who possessed great talent submitted some drawings to the Corcoran Art School, of Washington, which were accepted by the committee of awards, who sent her a ticket entitling her to a course in this school. But when the committee discovered that the young woman was colored they declined to admit her, and told her that if they had suspected that her drawings had been made by a colored woman they would not have examined them at all. The efforts of Frederick Douglass and a lawyer of great repute who took a keen interest in the affair were unavailing. In order to cultivate her talent this young woman was forced to leave her comfortable home in Washington and incur the expense of going to New York. Having entered the Woman's Art School of Cooper Union, she graduated with honor, and then went to Paris to continue her studies, where she achieved signal success and was complimented by some of the greatest living artists in France.

With the exception of the Catholic University, there is not a single white college in the national capital to which colored people are admitted, no matter how great their ability, how lofty their ambition, how unexceptionable their character or how great their thirst for knowledge may be.

A few years ago the Columbian Law School admitted colored students, but in deference to the Southern white students the authorities have decided to exclude them altogether.

Some time ago a young woman who had already attracted some attention in the literary world by her volume of short stories answered an advertisement which appeared in a Washington newspaper, which called for the services of a skilled stenographer and expert typewriter. It is unnecessary to state the reasons why a young woman whose literary ability was so great as that possessed by the one referred to should decide to earn money in this way. The applicants were requested to send specimens of their work and answer certain questions concerning their experience and their speed before they called in person. In reply to her application the young colored woman, who, by the way, is very fair and attractive indeed, received a letter from the firm stating that her references and experience were the most satisfactory that had been sent and requesting her to call. When she presented herself there was some doubt in the mind of the man to whom she was directed concerning her racial pedigree, so he asked her point-blank whether she was colored or white. When she confessed the truth the merchant expressed great sorrow and deep

regret that he could not avail himself of the services of so competent a person, but frankly admitted that employing a colored woman in his establishment in any except a menial position was simply out of the question.

Another young friend had an experience which, for some reasons, was still more disheartening and bitter than the one just mentioned. In order to secure lucrative employment she left Washington and went to New York. There she worked her way up in one of the largest dry goods stores till she was placed as saleswoman in the cloak department. Tired of being separated from her family she decided to return to Washington, feeling sure that, with her experience and her fine recommendation from the New York firm, she could easily secure employment. Nor was she overconfident, for the proprietor of one of the largest dry goods stores in her native city was glad to secure the services of a young woman who brought such hearty credentials from New York. She had not been in this store very long, however, before she called upon me one day and asked me to intercede with the proprietor in her behalf, saying that she had been discharged that afternoon because it had been discovered that she was colored. When I called upon my young friend's employer he made no effort to avoid the issue, as I feared he would. He did not say he had discharged the young saleswoman because she had not given satisfaction, as he might easily have done. On the contrary, he admitted without the slightest hesitation that the young woman he had just discharged was one of the best clerks he had ever had. In the cloak department, where she had been assigned, she had been a brilliant success, he said. "But I cannot keep Miss Smith in my employ," he concluded. "Are you not master of your own store?" I ventured to inquire. The proprietor of this store was a Jew, and I felt that it was particularly cruel, unnatural and cold-blooded for the representative of one oppressed and persecuted race to deal so harshly and unjustly with a member of another. I had intended to make this point when I decided to intercede for my young friend, but when I thought how a reference to the persecution of his own race would wound his feelings, the words froze on my lips. "When I first heard your friend was colored," he explained, "I did not believe it and said so to the clerks who made the statement. Finally, the girls who had been most pronounced in their opposition to working in a store with a colored girl came to me in a body and threatened to strike. 'Strike away,' said I, 'your places will be easily filled.' Then they started on another tack. Delegation after delegation began to file down to my office, some of the women my very best customers, to protest against my employing a colored girl. Moreover, they threatened to boycott my store if I did not discharge her at once. Then it became a question of bread and butter and I yielded to the inevitable—that's all. Now," said he, concluding, "if I lived in a great, cosmopolitan city like New York, I should do as I pleased, and refuse to discharge a girl simply because she was colored." But I thought of a similar incident that happened in New York. I remembered that a colored woman, as fair as a lily and as beautiful as a Madonna, who was the head saleswoman in a large department store in New York, had been discharged, after she had held this position for years, when the proprietor accidentally discovered that a fatal drop of African blood was percolating somewhere thru her veins.

Not only can colored women secure no employment in the Washington stores, department and otherwise, except as menials, and such positions, of course, are few, but even as customers they are not infrequently treated with discourtesy both by the clerks and the proprietor himself. Following the trend of the times, the senior partner of the largest and best department store in Washington, who originally hailed from Boston, once the home of Wm. Lloyd Garrison, Wendell Phillips and Charles Sumner, if my memory serves me right, decided to open a restaurant in his store. Tired and hungry after her morning's shopping a colored school teacher, whose relation to her African progenitors is so remote as scarcely to be discernible to the naked eye, took a seat at one of the tables in the restaurant of this Boston store. After sitting unnoticed a long time the colored

teacher asked a waiter who passed her by if she would not take her order. She was quickly informed that colored people could not be served in that restaurant and was obliged to leave in confusion and shame, much to the amusement of the waiters and the guests who had noticed the incident. Shortly after that a teacher in Howard University, one of the best schools for colored youth in the country, was similarly insulted in the restaurant of the same store.

In one of the Washington theaters from which colored people are excluded altogether, members of the race have been viciously assaulted several times, for the proprietor well knows that colored people have no redress for such discriminations against them in the District courts. Not long ago a colored clerk in one of the departments who looks more like his paternal ancestors who fought for the lost cause than his grandmothers who were victims of the peculiar institution, bought a ticket for the parquet of this theater in which colored people are nowhere welcome, for himself and mother, whose complexion is a bit swarthy. The usher refused to allow the young man to take the seats for which his tickets called and tried to snatch from him the coupons. A scuffle ensued and both mother and son were ejected by force. A suit was brought against the proprietor and the damages awarded the injured man and his mother amounted to the munificent sum of one cent. One of the teachers in the Colored High School received similar treatment in the same theater.

Not long ago one of my little daughter's bosom friends figured in one of the most pathetic instances of which I have ever heard. A gentleman who is very fond of children promised to take six little girls in his neighborhood to a matinee. It happened that he himself and five of his little friends were so fair that they easily passed muster, as they stood in judgment before the ticket-seller and the ticket taker. Three of the little girls were sisters, two of whom were very fair and the other a bit brown. Just as this little girl, who happened to be last in the procession, went by the ticket taker, that argus-eyed sophisticated gentleman detected something which caused a deep, dark frown to mantle his brow and he did not allow her to pass. "I guess you have made a mistake," he called to the host of this theater party. "Those little girls," pointing to the fair ones, "may be admitted, but this one," designating the brown one, "can't." But the colored man was quite equal to the emergency. Fairly frothing at the mouth with anger he asked the ticket taker what he meant, what he was trying to insinuate about that particular little girl. "Do you mean to tell me," he shouted in rage, "that I must go clear to the Philippine Islands to bring this child to the United States and then I can't take her to the theater in the National Capital?" The little ruse succeeded brilliantly, as he knew it would. "Beg your pardon," said the ticket taker, "don't know what I was thinking about. Of course she can go in."

"What was the matter with me this afternoon? mother," asked the little brown girl innocently, when she mentioned the affair at home. "Why did the man at the theater let my two sisters and the other girls in and try to keep me out?" In relating this incident, the child's mother told me her little girl's question, which showed such blissful ignorance of the depressing, cruel conditions which confronted her, completely unnerved her for a time.

Altho white and colored teachers are under the same Board of Education and the system for the children of both races is said to be uniform, prejudice against the colored teachers in the public schools is manifested in a variety of ways. From 1870 to 1900 there was a colored superintendent at the head of the colored schools. During all that time the directors of the cooking, sewing, physical culture, manual training, music and art departments were colored people. Six years ago a change was inaugurated The colored superintendent was legislated out of office and the directorships, without a single exception, were taken from colored teachers and given to the whites. There was no complaint about the work done by the colored directors no more than is heard about every officer in every school. The directors of the art and physical culture departments were particularly fine. Now, no matter how

competent or superior the colored teachers in our public schools may be, they know that they can never rise to the hight of a directorship, can never hope to be more than an assistant and receive the meager salary therefor, unless the present regime is radically changed.

Not long ago one of the most distinguished kindergartners in the country came to deliver a course of lectures in Washington. The colored teachers were eager to attend, but they could not buy the coveted privilege for love or money. When they appealed to the director of kindergartens, they were told that the expert kindergartner had come to Washington under the auspices of private individuals, so that she could not possibly have them admitted. Realizing what a loss colored teachers had sustained in being deprived of the information and inspiration which these lectures afforded, one of the white teachers volunteered to repeat them as best she could for the benefit of her colored co-laborers for half the price she herself had paid, and the proposition was eagerly accepted by some.

Strenuous efforts are being made to run Jim Crow street cars in the national capital. "Resolved, that a Jim Crow law should be adopted and enforced in the District of Columbia," was the subject of a discussion engaged in last January by the Columbian Debating Society of the George Washington University in our national capital, and the decision was rendered in favor of the affirmative. Representative Heflin, of Alabama, who introduced a bill providing for Jim Crow street cars in the District of Columbia last winter, has just received a letter from the president of the East Brookland Citizens' Association "indorsing the movement for separate street cars and sincerely hoping that you will be successful in getting this enacted into a law as soon as possible." Brookland is a suburb of Washington.

The colored laborer's path to a decent livelihood is by no means smooth. Into some of the trades unions here he is admitted, while from others he is excluded altogether. By the union men this is denied, altho I am personally acquainted with skilled workmen who tell me they are not admitted into the unions because they are colored. But even when they are allowed to join the unions they frequently derive little benefit, owing to certain tricks of the trade. When the word passes round that help is needed and colored laborers apply, they are often told by the union officials that they have secured all the men they needed, because the places are reserved for white men, until they have been provided with jobs, and colored men must remain idle, unless the supply of white men is too small.

I am personally acquainted with one of the most skilful laborers in the hardware business in Washington. For thirty years he has been working for the same firm. He told me he could not join the union, and that his employer had been almost forced to discharge him, because the union men threatened to boycott his store if he did not. If another man could have been found at the time to take his place he would have lost his job, he said. When no other human being can bring a refractory chimney or stove to its senses, this colored man is called upon as the court of last appeal. If he fails to subdue it, it is pronounced a hopeless case at once. And yet this expert workman receives much less for his services than do white men who cannot compare with him in skill.

And so I might go on citing instance after instance to show the variety of ways in which our people are sacrificed on the altar of prejudice in the Capital of the United States and how almost insurmountable are the obstacles which block his path to success. Early in life many a colored youth is so appalled by the helplessness and the hopelessness of his situation in this country that in a sort of stoical despair he resigns himself to his fate. "What is the good of our trying to acquire an education? We can't all be preachers, teachers, doctors and lawyers. Besides those professions there is almost nothing for colored people to do but engage in the most menial occupations, and we do not need an education for that." More than once such remarks, uttered by young men and women in our public schools who possess brilliant intellects, have wrung my heart.

It is impossible for any white person in the United States, no matter how sympathetic and broad, to realize what life would mean to him if his incentive to effort were suddenly snatched away. To the lack of incentive to effort, which is the awful shadow under which we live, may be traced the wreck and ruin of scores of colored youth. And surely nowhere in the world do oppression and persecution based solely on the color of the skin appear more hateful and hideous than in the capital of the United States, because the chasm between the principles upon which this Government was founded, in which it still professes to believe, and those which are daily practiced under the protection of the flag, yawns so wide and deep.

WASHINGTON, D. C.

Salome: A Septic Opera

BY CARROLL BRENT CHILTON

[Not since the production of "Parsifal," three years ago, has any musical event aroused such heated discussion as Richard Strauss's "Salome," which is given this week in the Metropolitan Opera House. Such a competent musical critic as Laurence Gilman says of the opera: "Beyond question it is his most elaborate and most venturesome work. In complexity of structure and audacity of invention it far surpasses any of his previous achievements, either symphonic or operatic." Next week we shall give an account of "Salome" as produced in New York. Mr. Chilton here, as in his attack on the work of Bernard Shaw in THE INDEPENDENT of March 8th, 1906, shows himself a keen antagonist of what he considers the degenerate tendencies of modern literature and art.—EDITOR.]

AT the "Twelfth Night" Revel, held in the Berkeley Lyceum, on January 7th, there was given a satire dealing chiefly with hits at the excesses of stage realism in modern plays.

Sitting on the floor of the stage with back to the curtain arch sat a buxom maiden in evening garb. As hit followed hit she would raise her eyes to heaven and say, with all the solemn impressiveness of the "realist": "God! but this is Life!"

Just now society is all agog over the forthcoming *première* of Richard Strauss's "Salome," an admittedly degenerate *per*version by Oscar Wilde of the story as told in Matthew, chap. iv, and Mark, chap. vi.

That in the advertisement the title is put in type four times as large as the regular announcements is significant.

What is the explanation of this significance?

Wilde has made of the niece and stepdaughter of the Tetrarch of Galilee "a being at once fascinating and repulsive, beautiful and depraved—a figure unique in fiction." But there is no justification in the way of historical truth for his creation. The Evangelists do not even mention the maiden's name, and they state clearly that in asking for the head of the prophet she was acting in accordance with her mother's suggestion. The opera has already been given on thirty stages. The leading critics in Germany are precise in their condemnation of "the lewd, sadistic, bloodthirsty Salome—the creation of Wilde's diseased brain and soul." Dr. Leopold Schmidt writes in the *Tageblatt:*

"The perverse sensual nature of the poet prompted him to utilize the act of his heroine and to cater to the taste of the decadent times. A text like that of 'Salome' has nothing in common with the art of music, but opposes its whole nature, and even the greatest composer could only give it an external decoration."

E. E. Taubert, critic of the *Post*, writes:

"I took home with me the impression that the feeling of abhorrence which Oscar Wilde's drama with its perverse concupiscence arouses in every healthy and natural person is materially increased by Strauss's music. Salome is a vain being who, conscious of the fact that every man who crosses her path falls a prey to her charms, from pure ennui throws herself at the prophet Jochanaan; rejected by him she becomes a murderous beast."

Says Mr. Abell, correspondent of *The Musical Courier:*

"In my opinion all of the gush and enthusi-

asm for this perverse opera come from perverse natures, and the greater the enthusiasm, the more perverse the natures."

All the arts, says Schopenhauer, answer the question "What is life? Even music replies, and more profoundly than anything else."

It may not be amiss to ask ourselves what is the sphere of "Life" to which this production is the answer. Why the scare head for "Salome"? Is the Sphinx's riddle to be solved at last? Obviously there is something afloat, else why does the cable sing with the glad tidings that the new revelation is come. To the plain man the conclusion is irresistible. The measure of emphasis is determined by the appeal of an unhealthy subject. A play so corrupt that it is legally forbidden in England is sure, it seems, of cordial support from the patrons of our fashionable opera, many of whom have had their seats ordered ever since the performance was announced.

The fact that the underlying spirit of the action of this "Play" is known to belong to the domain of *morbid pathology* renders the attraction only the more powerful and recalls the incident of $30 being paid for seats at the first and last performance of "Mrs. Warren's Profession."

"Let us investigate and judge for ourselves," seem to be the principles which conduct so many of the fair and lovely to investigating "the life" of certain quarters of Paris.

The attempt will, of course, be made, by the prurient to cover this diseased text with the veil of music. Indeed, it was wittily said by a clever woman in my hearing, that since few can ever understand what is going on on the stage at an opera, no harm would be done. It is well known, however, that the demon of prurient curiosity gives powers to the vile to search out the vile, rising almost to the plane of sibyllic divination.

Extenuation is also sought by those who will flock to see the new wonder, in the thought that the art justifies the subject—"Art for art's sake,"—which Ruskin said was the devil's motto. But could any power of art justify a subject inherently vile? It could, perhaps, be said that the subject is worthy of the student's attention, and of a place in the encyclopedias of science, like the life of Count Sadi. Here it exists to reflection only. When made to appear to perception, it has eminence a thousandfold, and imposes on the unwary, whose sole criterion is and must be sensational effectiveness.

Neither can it be pretended for a moment by either the composer or the opera house managment that such a production is in the interest of art. It is made in the interest of money and the composer has frankly stated that he has come to care

RICHARD STRAUSS.

nothing for art. All he desires is to make enough money to live at ease.

Capitalized pseudo-religion in "Parsifal," having become played out, as a sensation, recourse was had to its mighty opposite, depravity, and since what's worth doing is worth doing well, the depravity had to be total. For alas! just plain, unadorned depravity has little or no drawing power. It is too ordinary to be romantic.

Is it not clear that there must be a principle in art, and that that principle is selection, rejection and discrimination? Now, shall the partial vile be accepted as

the answer to life and rewarded with selection? Shall we reject the wholesome in favor of the vile and discriminate in favor of the prurient because of its higher box-office efficacy? That it is justifiable seems to be the view of those who enjoy such things. Yet, unless we deny principle at all, it is plain that the kind of "art life" is twice depraved. It depraves him who takes and damns him who gives.

The moment the subject is admitted as a suitable one for the fierce light that beats upon the throne of art, the argument falls to the ground. Yet who can read the play and then admit the point?

The breath of life of every art and also of character and religion and all things excellent is the *affirmative* principle. "Omit the negative proposition." Negation is disorganization. Negation is true. It is real. It exists, but artistically or poetically it does not matter. The poet will see evil, see it better than his neighbor, perhaps, but it is a point of honor with him not to *notice* it too much, else he will soon notice nothing else.

"The essential error consists in selecting the difficulties which are the rare, exceptional phenomena of nature as the basis of analogy and argument. In the comprehensive and generous study of Providence the mind may indeed already have overcome the difficulties, and with the lights recently gained from the harmony, design and order of creation, have made those shadows pass imperceptibly away; but when forced again into their very center, compelled to adopt them as a fixed station and point of mental vision, they deepen round the heart again, and instead of illustrating anything, become solid darkness themselves."—(James Martineau, "Studies of Christianity.")

"What is it," asks Paul Elmer Moore, in an illuminating essay on "Gissing" (that "miner into the dark evermore for blacker pits of night") "to paint in all its hideous colors this death of the soul, to forget the glad things of the world for its shadows, to deny Agamemnon and Achilles and choose Thersites for the hero of the tale."

If it be a moral obliquity in the artist creator to provide such public entertainment, what of the moral responsibility of those who patronize it? It is not that they personally will be injured so much as that their presence there piques the curiosity of the thousands and thousands of those who accept the verdict of popular fashionable approval as the sign out of heaven that here is what they should admire and know.

Ruskin had a theory that each person of conspicuous moral and spiritual power had a small ring of those directly influenced. Each of those in this ring had, in turn, another circle who received a diluted influence, and so on to the ultimately endless reverberation of every deed and every expression.

Perhaps only a few thousand will enjoy the first-hand degradation and denigration of "Salome," but a million will feel its influence. The willingness of people to lend the approval of their presence to "Salome" strengthens the suggestion that culture finds it difficult to thrive above the want line.

Is it too much to say that as tyranny exists only thru the consent of the tyrannized, the patrons of "Salome" will have to reckon with their consciences in those hours when they consider the abiding realities of life, and try to determine whether they have done the things they ought not to have done and left undone the things which they ought to have done?

One wonders whether the obligation of nobility has fled, where the sense of responsibility has gone in our cultured classes. To "receive favors and render none" has been said to be "the one base thing in the universe." As their heritage of external freedom and ease is greater, should not their sense of responsibility be increased? Instead of that it seems to disappear altogether. To receive the heritage without accepting its responsibilities is suicide. The Rata plant in New Zealand climbs up and attaches itself to the large trees, but if it does not attach to the tree and absorb its life, it turns upon itself and is self-strangled, and so it is, perhaps, with the tree of life.

New York City.

A Model Farm from a Long Island Wilderness

BY JAMES C. BAYLES, M. E., Ph.D.

THAT nothing is so delusive as experience is attested by all experience. It is fairly to be presumed of anything worth doing that a great many people know it to be impossible, for the reason that in one way or another they have tried it and failed. However, it is the doing of these impossible things which marks the steps of progress.

For example, the small farmer in the middle and eastern townships of Long Island has always known that the infertile soil of the so-called waste lands would not repay cultivation. It could be made to raise crops in time, if all the conditions favored, but if to the cost of clearing the land was added the loss of time and interest while waiting for the roots to decay sufficiently to permit plowing—ordinarily six or seven years—to clear it at all was to work for posterity. The Norfolk sandy loam and the sassafras gravelly loam of the classification of the Department of Agriculture are wholly deficient in leaf mold or components of like value. Their function in the economy of nature has seemed to be to raise scrub oak, dwarf pine and unpickable wild berries. Between conflagrations, which occurred periodically, these areas assumed the character of a wilderness, covered with a dense growth of worthless vegeta-

THE EXPERIMENT FARM, WADING RIVER, L. I., AS IT LOOKED BEFORE WORK BEGAN

tion thru which even an enterprising rabbit would have difficulty in making his way. A few adventurous pioneers had strayed into this uninviting country and made, here and there, little clearings which suggested possible further development, but nothing seemed to come of these beginnings. The chief ambition of the settler seemed to be to move to better land as soon as he could. That so few emigrated was doubtless explained by the fact that they could not afford to go somewhere else.

THE OUT-DOOR PACKING HOUSE.

To President Ralph Peters, of the Long Island Railroad, occurred the idea that it might be a judicious use of a little money to demonstrate the fact that these waste lands, like the proverbial singed cat, are a good deal better than they look. That so many square miles within a short distance of New York were without value to any one, furnishing neither passengers nor freight to the railroad nor homes for home seekers of small means, suggested a test to determine what potentialities of profit resided in them under intensive cultivation. A great farm with a costly plant of agricultural machinery would not so well accomplish the purpose in view as a small tract, representing a small investment, but worked with close economy with reference to the largest possible return per unit of area cultivated. The experiment had still other objects in view which will be mentioned later on.

A plot of ten acres of the most unattractive wilderness, densely covered with scrub growth and ferns, and punctuated with the blackened stems of fire-killed trees, was chosen and purchased. It is in Riverhead Township, sixty-eight miles from Manhattan. The name of the nearest settlement is Wading River. A manager was selected who had sound common sense and sufficient imagination to serve his purposes, but was without experience in farming, experimental or practical. Perhaps this was his highest qualification.

The problem presented to the manager of the Wading River farm was to enter empty-handed upon ten acres of wild and naturally infertile land, in the least possible time have it covered with growing crops, and show a profit on the operations of the first year. When the local farmers heard of this they welcomed it as a choice contribution to the gaiety of nations, and conferences over by them in this connection in distinction from eternity. What the ten acre patch looked like when the clearing began is shown in an accompanying illustration from a photograph taken September 7th, 1905. Local labor would have cleared it, no doubt, but in the local way, and that would not have met the requirements of an experiment designed to be instructive. The initial error was promptly corrected

VIRGINIA HORSE TOOTH CORN PLANTED FOR FODDER WENT UP ON THE VIRGIN SOIL TO SIXTEEN AND EIGHTEEN FEET AND MATURED FINE EARS AS WELL.

the top rails of fences were enlivened with noisy mirth. It gave them great satisfaction to think how useful would have been their advice had it been asked and how much more would be known about practical farming in the offices of the Long Island Railroad in a good deal less than twelve months.

The first and only important mistake of the manager of the experiment was a perfectly natural one—that of employing local labor to clear the land. From the point of view of the men engaged this was a work of time—the term being employed by bringing in a gang of Italians without experience in any kind of work comparable to that in hand. The scrub growth quickly disappeared, and it was then found that a more expeditious way of stump extraction and root eradication was needed than was known to the farm dentistry of Suffolk County. Dynamite was the agent chosen. It is extremely sudden, and equally thoro. Not only does it remove a stump in the shape of kindling wood without further splitting, and without as much adhering dirt as would tip the beam of a druggist's scale,

but it loosens the soil and permits all roots and runners to be picked up by a harrow or hay rake and gathered in piles for burning. The brush, stumps and roots thus gathered were burned and the ashes distributed. Almost before the ground was cold the manure spreaders followed, and after them came the plowmen. Usually, the plowing of newly cleared ground is an experience which puts the soul of the plowman in jeopardy. In this instance, however, not once did the plowman take a header over his team, nor were any extraordinary demands made upon his vocabulary. Deep and straight furrows presented no difficulties. The loosened soil, root free, turned more easily than meadow sod, and plowing would have been unnecessary if it had not been desired to cover in the ashes, four hundred pounds to the acre, and the manure required for fertilization. The allowance of manure for this naturally light and impoverished soil was ten tons to the acre and it cost sixty cents a ton on the ground.

In sixty-four days from the date of the photograph showing the original condition of the land, the whole ten acres were under cultivation, growing their first crop—a planting of rye to be plowed under early in the spring and furnish humus. When plowing time was reached this rye was from fifteen to thirty inches high. It served its purpose admirably. On three acres an orchard had been set out, also beds of rhubarb, asparagus, horse-radish, strawberries and other perennial staples of the market garden. During the first winter the mortality among these plantings was limited to two out of five hundred strawberry plants. All the fruit trees and other vegetables lived and became industrious with the coming of spring.

The early vegetable planting which followed the turning under of the rye included everything useful, indigenous or

MODERN IMPLEMENTS MADE IT POSSIBLE TO RAISE 218 VARIETIES OF VEGETABLES IN THE TEN-ACRE MARKET GARDEN AND SIX VARIETIES OF FODDER IN THE EIGHT-ACRE DAIRY SECTION, WITH BUT THREE MEN AS THE WORKING FORCE.

acclimated, and many plants of economic value previously unknown to the local farmer, such as pe-tsai, mangel-wurzel, schwartz-wurzel, peanuts, cardoon, scorzonera, borage, udo, martynia, celeriac and other imported plants of food or industrial value. In all, some two hundred and eighteen varieties were tried, with an average success both surprising and gratifying. Very likely a larger and more immediate profit would have been realized from devoting the whole ten acres to a few staple products, but in an experiment station there was much to be learned of value besides how to make land pay best. The larger objects in view were to solve for the farmer of the locality every problem of soil and climate of interest to him, to test varieties with a view to discovering which were best adapted to local conditions, to establish new and higher standards of excellence in garden produce, as well as in preparation and packing for market, and to learn how successfully to deal with blights, rots, parasites and insect plagues which so often defeat the plans of the farmer who trusts too much to nature, and for whom the net results of a year's work in blackened stalks, perforated foliage, decayed tubers, sick trees and unmarketable fruit frequently but serves to recall Senator Roscoe Conkling's memorable reference to "the bright beginning and the bitter end of a halcyon and vociferous proceeding." The enemies of the farmer seem to have had some idea of what was going on. Everything known, and some things unknown and perhaps peculiar to the atmospheric conditions of the season, selected the Wading River Experimental Station as a field on which to try conclusions with inimical agencies. Apparently nothing that could happen to damage crops failed to put in an appearance on schedule time. In two or three instances parts of the crop were lost or badly injured, but this is not likely to happen again. It appears to be as true in agriculture as in law that there is no evil without a remedy, and an important part of the altruistic purpose of the Ex-

CAULIFLOWER MADE A SUPERB GROWTH.

periment Station was to define the evils of the farmer and discover how to correct them. The results in this respect have been of great and permanent value. It is doubtful if the loss from every cause next year will be of consequence.

The investment in land and improvements at Wading River was so small that a favorable balance sheet involves no ingenuity in bookkeeping. It is this feature which gives it especial interest for the farmer with small means. The land cost $23 an acre, but such an advantage is no longer open to the settler. That part of Long Island is now experiencing something like a "boom," and the asking price per acre is now $25. Perhaps even this advance does not place it wholly beyond the reach of the thrifty and provident. The dynamite used in clearing the land, with the services of the expert who used it, cost at the rate of about $67 per acre; clearing and otherwise preparing the land cost, for labor, about $60 per acre. For teams in plowing, harrowing and cultivating the cost was about $20 per acre. This brings the cost of the farm ready for planting up to about $194 per acre. The experimental station, in one way or another, has cost a great deal more than that, but it has paid on the operations of the first year and will be continued. In the hands of a private owner, with no purpose of public benefit in view, it would have a good deal more than cleared its cost on the results of one year of cultivation.

An important and probably essential feature of the development is the provision for artificial irrigation. This was provided at a total cost of about $1,600, which was considerably more than a farmer would have spent for results equally satisfactory. The normal rainfall of that part of Long Island is about forty-eight inches; but so light and porous is the soil that the market gardener must expect more or less serious injury from droughts at critical times, unless prepared to sprinkle his beds when they need it. There is no lack of water anywhere on Long Island. At

the Wading River station a three-inch tube was driven. Water was found at about 100 feet, but in expectation of a more abundant flow the tube was driven fifty feet further. There water of the purest quality and of unfailing abundance was found, under a natural pressure which raises it some fourteen inches above the surface. A 5,000-gallon tank was built, which is filled by a pump actuated by a small gasolene motor. Iron pipes are run to points convenient for attaching hose with sprinkler nozzles, and by this means every inch of the ten acres may be refreshed when and as such refreshment may be needed. The soil offers no obstacles to the well-point, being quite free from boulders.

The net results of the first year of operation have been entirely satisfactory. Some of the growing crops are shown in the accompanying illustrations. The ordinary garden vegetables, such as radishes, onions, spinach, beans, cucumbers, peppers, peas, lettuce, melons, squash, corn, cabbage, tomatoes, egg plant, beets, celery, cauliflower, turnips and asparagus, have all done extremely well, and at the county fair took nearly all the prizes. Potatoes yielded 260 to 280 bushels to the acre. Corn was mighty in stalk and ample in ear. Probably corn as fine was never before grown on Long Island. Of many varieties of vegetables three crops were gathered and of some four crops. The success of the fodder crops was extraordinary. Alfalfa grows splendidly; so does teosinte, millet and fodder corn. The fruit experiments include many varieties of apples, peaches, plums, apricots, nectarines, quinces, pears and every kind of berry. They are all satisfactory.

The most obvious and chief value of this experiment is in demonstrating beyond discussion that the ambitious man, who desires to become a landowner and farmer on a small capital, may do this as well within ninety minutes of Broadway as in some remote section of the West, to reach which he must leave all but hope behind. Intelligent truck farming

ENDIVE TIED FOR BLANCHING.

always was and always will be a profitable industry, especially near a great and insatiable market. Of land as good as that selected at Wading River for Station No. 1, and subsequently at Medford for Station No. 2, there are on Long Island probably 200,000 acres, or say 312 square miles. As the ten acres described amply and comfortably sustained a population of six, these waste lands would furnish homes for at least 120,000 persons. The task of the settler, even tho an amateur, is now very much easier than he could have hoped to find it if dependent upon his own judgment or the advice of those native to the section. At either of the experiment stations he may learn what best to do and how best and most cheaply to do it. Every difficulty likely to confront him has been wrestled with and conquered, and the information he needs may be had for the asking. None of the methods or agencies by which success has been made possible for him are beyond the means of one able to become a farmer at all. He is offered a wide range of selection among profitable crops, and may specialize according to his fancy. Nearness to the largest absorbing and distributing market of the United States is an advantage likely to be appreciated by any one who has had experience of long-distance transportation in refrigerator cars. To invite local development where no inducement for it previously existed, by placing these advantages at the command of the settler, introduces the element of statesmanship into railroad management.

New York City.

Immanence

BY MARIAN W. WILDMAN

In the splendor of the midnight; in the freshness of the morn;
In the majesty of thunder when the skies are lightning torn;
In the shimmer and the shiver of pale moonlight on the sea;
In all things declared Thy handiwork, I see, I worship—Thee!

The Creator! The created! Paltry words that blind the soul
To the glory and the greatness and the beauty of the whole!
Thou the maker of the universe? Thou art its pulsing heart,
And Thy beat is in its arteries unto the utmost part!

Thou—the gilding of the sunlight! Thou—the silver of the rain!
Thou—the rippling of the breezes over fields of springing grain!
Thou—the sweep of upland meadows, all with milky daisies starred!
Thou—the rainbow iridescence on the beetle's golden shard!

Thou—the marching, up thru centuries, of Life, the undismayed:
Up from chaos; up thru conflict; never daunted nor afraid;
From the cell that knew but hunger up to a Man who guesseth Thee!
Thou art Matter! Thou art Spirit! Thou—the Riddle! Thou—the Key!

Warring waves of joy and sorrow, hate and love and space and time,
Sink to calm upon the vastness of Thy shoreless sea sublime!
Thou—the finite: star and blossom; pride of man and sparrow's fall!
Thou—the infinite, transcending, comprehending, hushing all!

Norwalk, Ohio.

Mr. Lang's Ghost

BY ANDREW LANG

THERE has been sent to me, from the office of THE INDEPENDENT, a long newspaper article (from an American journal), called "Mr. Lang's Ghost." The text on which the writer preaches is my article in THE INDEPENDENT, styled "The Occult Up to Date." The criticism of me and my poor ideas opens thus:

"I no more doubt," says Andrew Lang, writing in the current INDEPENDENT, on "Occultism," "that these queer things do happen than I doubt the fact that I am writing these words. . . . People do not reflect that if one (ghost) tale out of a thousand is true the circumstance is of much stronger scientific interest than radium or wireless telegraphy. . . . I merely want the occult to be explained on scientific lines."

Here it is to be remarked that the word "ghost" has to be interpolated into my sentence as the ground of the criticism. The word "ghost" ought, as I shall show presently, to be excluded from this discussion. But, on the other hand, I was untrue to my own opinions when I wrote that if "one" tale of "these queer things" is true, the circumstance is of much stronger scientific interest than radium or wireless telegraphy. I withdraw the remark. The truth of *one* of "these queer things" would carry no weight. Let me take an example, an instance which reaches me today on good authority. I do not give the names of the persons concerned, but substitute others.

Mr. Smith was dying of "a stroke of apoplexy," to use the popular expression. For days he lay unconscious or delirious, and here we must note that "unconscious" is a popular term, meaning no more than that the observers do not recognize in the patient signs of consciousness of his environment. Even of that he may be perfectly conscious, as in cases of cataplexy, and, as I have melancholy occasion to know, in cases of apoplexy. However, to all outward appearance, Mr. Smith lay for days unconscious or delirious. His son, Robert, sat beside Mr. Smith thruout one day till dinner time, when he left and went to dine at home. In his absence, Mrs. Smith found Mr. Smith awake, quite collected and coherent. "Where is Bob?" he asked, and was told that his son had been with him all day and had left about an hour before, to dine.

"Ah, well!" said Mr. Smith, "his face is not hurt; his face is not hurt!" He then turned and died.

His son, Robert, in driving home, had a cab accident (he lived in a large provincial town with crowded streets); he was upset into the road, and the wheel of a passing car just grazed his cheek, but without inflicting any injury. Now, "put case" that this tale is true, and that Mr. Smith was somehow aware of the accident to his son. If there were only *one* such case, everybody sees that it would be of no scientific moment; there would seem to be a mere coincidence between a dream of Mr. Smith's and his son's adventure. "These queer things" only excite my interest and curiosity when too many of them occur to be easily explained, by me at least, as mere fortuitous coincidences.

Thus of dreams in natural sleep which coincide with or anticipate events unknown to the dreamer, I think very little. Myriads of dreams occur every night; out of so many shots the miracle would be if some did not hit the bull's eye. I daresay that every year one or more people dream of the Derby winner, because thousands of people are guessing in their dreams, and two or three guess right. Take the Favonius case. A man came to an acquaintance of mine and said, "What is the Latin for the Southwest Wind?" "Favonius," said my friend. "That's the name," said the other; "I dreamed last night that Favonius won the Derby, but I could only remember that Southwest Wind was the English of the word when I woke." There was no Favonius in the list of horses, but, on reaching the racecourse, the men found that "the Zephyr colt" had been newly named—Favonius. Probably the name Zephyr ("west wind") colt had been converted into

Favonius, ("southwest wind") in the sleeping mind of the dreamer, tho, when awake, he could not remember the Latin word for southwest wind. Favonius won; the dream was a good guess, no more.

No more was a dream of a kinswoman of mine, whose husband heard her exclaiming, in her sleep, "Oh, Thursday, at 4 o'clock!" In the morning he asked her what she had been dreaming about. She said that the doctor attending an invalid friend, Mr. K., came and told her that Mr. K. died on Thursday, at 4 p. m. The night of the dream was, let us say, Tuesday, May 3. On Thursday, May 5, Mr. K. was better and continued convalescent, but died at 4 p. m. on Thursday, May 12. There are seven days in the week, twenty-four hours in each day. If Mr. K. was to die, and to die exactly at any hour, it seems only odds of 168 to 1 against his dying on a Thursday, at 4 p. m.

Thus coincidences of events with dreams only become curious and interesting if the dream is full of minute details which the dreamer does not know, but which are correct. In short, it needs not the occurrence of "one queer thing," but the frequent and well authenticated occurrence of many such "queer things" to raise a presumption that they are of strong scientific interest. My critic did not raise this obvious point, of which I make him a present.

Many successful cases of crystal-gazing, which have the effect of evidence on my mind, because I know the persons concerned, and have been present at the experiments, do, I think, suggest the desirableness of more experiments by trained experts in psychology. The long series of successes known to me put the explanation by chance coincidence out of court. "As science it is ludicrous," says the critic, speaking of my methods. Our English scientific paper, *Nature*, is sceptical enough in all conscience. But in a review of a book styled "Crystal-Gazing," by Mr. N. W. Thomas, and of my introductory chapter therein on "supernormal," perhaps "telepathic" results of experiments, *Nature* (December 5th, 1906) is kind enough to applaud my "judicial" attitude and to wish that I would persevere in experimenting. Apparently my "scientificness" is regarded as less than ludicrous by an authority difficult to satisfy.

The critic states my own case when he says that, as to what he calls "ghost stories," "the only real controversy concerns the accepted explanation of them." That is quite true. The Rev. Mr. Jones, to take the critic's instance, says that his deceased grandmother appeared to him in his study. There is nothing exciting in that circumstance! Various living people have "appeared" to me, when they were, in fact, elsewhere. Why should not I have an hallucination of the appearance of my deceased grandmother as readily as of my living cousin? Science, says the critic, looks for "a natural explanation of the occurrence, and usually finds it in some physical or mental condition of Mr. Jones's body or mind at the time."

Science does not, to the best of my information, "usually" find any cause of hallucinations of the healthy and sane, occurring but once or twice in a lifetime. In studying the literature of such hallucinations of the sane, what one notes is that an explanation *cannot* be discovered, as a rule, in the mental or bodily condition of the person hallucinated. This statement, I think, will be accepted by psychologists: what "the average man" says is indifferent to science. I am *not* "predisposed" to think that the experience of the Rev. Mr. Jones was somehow produced, or caused by the agency of the spirit of his regretted grandmother. That is precisely the last hypothesis to which I should have recourse. My critic might adopt the hypothesis that I am not absolutely an idiot! We do not know, science does not know, any general law govering such hallucinations, occurring once or twice in the experience of men who are of undisputed sanity, and, at the moment, are in their normal health.

Mr. Jones's experience one would regard as a "subjective hallucination." The word "ghost" is a public nuisance! It is understood to convey the meaning that what I call an hallucination is caused by the agency of a spirit of a dead person. The word "ghost" thus introduces a theory which, even if in any

case correct, is scarcely capable of proof.

How can the ghost theory be proved? Suppose Mr. Jones's grandmother tells him things that he thinks he does not know, which are found to be true. Then we may argue that Jones had once known them, and that the supposed message is really a revival of his own lapsed memory. It might also be argued, if the first explanation be impossible, that the facts were "wired on" to Jones's mind from some other living mind. This would involve "telepathy," and, if telepathy were rejected, if retrocognition were also rejected, then—must science not call Mr. Jones an inaccurately imaginative person, and reject his evidence?

My critic says that the "true scientist" differs from me "in just this, that, until every other possibility has been exhausted he refuses even to consider a supernatural explanation." I *never* "consider a supernatural explanation!" And I never resort to a "supernormal" explanation till I have exhausted the field of known possible normal explanations. Every sane man knows that the normal is of much more frequent occurrence than the supernormal. One's time, when it is occupied with these things, is passed in considering normal explanations, such as "suggestion"; misstatements, voluntary or involuntary; misapprehensions of facts; emotional or pathological disturbances of the witnesses; chance coincidences; deliberate imposture; rats, whiskey, water pipes out of order, rapping magpies; unconscious moments of slumber, and so forth.

As to "ghosts," I cannot remember at this moment a single case in which I think that the direct agency of a spirit discarnate is the least improbable explanation of any well-recorded phenomenon. I am said to "want to believe in ghosts of the dead who come back with messages for the living." If so, I must be a singularly self-denying character, for tho the thing may be possible for all that I know, I have never got beyond thinking that there is evidence raising a fair presumption in favor of its possibility. But such evidence is scanty, and is susceptible of other possible explanations, as nobody but "the average man" supposes that he knows all the possibilities in the universe.

As a rule it is not worth while to take notice of anonymous newspaper articles. But that on which I have been commenting is a typical specimen of the philosophy of "the average man," and, as such, is worthy of examination. He accuses me of holding opinions which I do not hold, and of neglecting the very methods of inquiry which I employ, and of possessing "a greatly weakened if not destroyed sanity of judgment." He writes about a topic with which his acquaintance is obviously of the slightest. He is the average man appealing to the average man. Not of such is the Kingdom of Science.

ST. ANDREWS, SCOTLAND.

Recessional

BY HANNAH M. BRYAN

EXULTANT, or with forehead bowed,
In cloth of hair, or raiment white,
Still art Thou, God, our guiding cloud;
Still art Thou, God, our pillared light.
To Thee we look, in Thee we trust;
We are but dust, we are but dust.

Fair the green Earth whereon we tread,
Thy footstool and Thy Son's delight;
Thy Throne is glorious overhead,
Deep-set with many a spherèd light.
In Him, in Thee we hope, we trust;
We are but dust, we are but dust.

The forests stretch in emerald night,
In billowy green the plains expand,
The great sea sleeps in crystal might
Within the hollow of Thy hand.
We rest in Thee, our hope and trust;
We who are dust, we who are dust.

Thine are the fixed and wandering lights,
Their source and central sun Thou art;
Beyond all worlds, above all hights,
Yet dwelling in each contrite heart.
Lord of all life, in Thee we trust;
We who are dust, we who are dust.

MEMPHIS, IND.

The Solution of the Milk Problem

BY JAMES JOHNSTON, M. D.

[Dr. Johnston is a Canadian by birth, a graduate of the University of Toronto and University of Pennsylvania. He is in general practice but has given some time to military medicine and public health. As surgeon of he Sixteenth Pennsylvania Regiment for twelve years he had much experience in strike and riot duty which proved valuable during the Spanish War. He organized the Ambulance Service of the First Army Corps at Chickamauga and commanded a detachment in two engagements in Porto Rico, where he also built and managed a large hospital in the field and was rapidly promoted to Acting Chief Surgeon. He began to study milk as a member of the local board of health ten years ago, and is now materializing this plan, with the assistance of the United States Dairy Division, at Bradford, Pa.—EDITOR.]

MILK is our most important food. The milk question is one of the most important problems now before the public for solution.

The average citizen thinks that he knows good milk when he gets it, and if he has any fault to find at any time it is only with the lack of richness due to watering or skimming. He thinks of milk as a natural food that has been used for so long a time that there can be no doubt about it, and no questions requiring his personal attention concerning it. He overlooks the fact that milk is not taken in exactly the natural manner, and that modern methods of handling it, peculiar to this country, have given the business a new life with which it is his duty to make himself acquainted.

The milk business is really two businesses—dairying and distributing. Both have their problems, but it is with the latter—the handling of the milk—that the public must be first concerned. This public concern is generally recognized in laws which aim, first, to prevent dishonesty by establishing a legal standard of richness, and second, to require cleanliness.

But these laws fail because a legal standard must be made low enough to admit the poorest natural milk, while methods that ensure cleanliness are expensive.

The system of protection by law works badly in every way. It is quite impracticable to examine milk as it is delivered from door to door in daily retail quantities; and when it is examined in bulk and left in the hands of the dealer there is such a wide open opportunity for changes, with or without guilt on the part of the custodian, that the work of the inspector may be useless.

Another trouble is that, whenever there is anything like a crusade on the part of the authorities the sale of milk drops off immensely.

However practical the general plan of regulation by law may be when applied to other commodities, it is a failure when applied to milk. Protection by law is protection by wit in any case, and the sharpest wits are always found in those whom the laws are made to grind. There is also this radical trouble with laws that they fail to prescribe a reward for merit.

There has been a very great amount of labor performed by scientists during the past few years in defining the dangers that lurk in milk and in defining the remedies for these dangers. There is, however, a very great amount of labor unperformed in the application of these remedies.

The twin vices in the retail milk business are ignorance and competition. The dealer in competition will not do anything more expensive to himself than his competitor does; the average householder is always ready to save a cent and is totally unable to discriminate. Since milk is a recognized danger to health there should be no second quality sold. This makes it necessary that competition be suppressed.

How this may be done, whether by municipal ownership or by a popular stock company or in some other manner, is of little consequence. But that it can be done, that it is perfectly practicable to effect a general consolidation, is shown by the success of many sanitary milk

companies, which have secured for themselves a monopoly of the milk business in many places.

Sanitary milk plants are operated by companies that are avowedly business organizations. Hygienic possibilities are an inducement to subscribers to stock and also an advertisemnt of the products to consumers. These companies are distributors exclusively; very few have any production of their own. The milk is treated in these plants by clarification, pasteurization and cold storage, and the business includes consolidation and simplification of delivery, together with the manufacture of milk products.

These companies are able to comply with the most exacting laws. In fact, they are able to do so much better with their equipment than their competitors are able to do without it, that the competitors can be legislated out of business and a perfect monopoly obtained thru the co-operation of the board of health. These companies show the way in which citizens may control the milk business more effectively than by making laws. They are not themselves a solution of the problem, because there is an opportunity for abuse and mischief in these plants that the public should not be satisfied to endure.

If they were managed by public-spirited men, who would buy the best milk obtainable; who would furnish full, rich milk without regard to the

DR. JOHNSTON.

legal standard; who would be governed in all things by the interest of the people and not particularly by their own, all would be well. But should a community expect a business man or a business organization to work in the interest of the community or to keep in mind any other thing than to make money.

There is a rule that seems to be founded very deep in the order of things in this world which requires us to do for ourselves.

Just as sure as the milk problem is a problem for the community, the community must do for itself in this matter. It must purchase the supply, care for it with its own equipment and dispose of it according to the demand either as milk or as milk products. The final product, the least remunerative, but the most stable, is butter; and the butter department ought to receive the day's surplus, and no fresh milk should be carried over from one day to the next. The control of the milk supply would not be complete if it did not include the manufacture and distribution of milk products. There is the same public reason for eliminating competition in all, as well as in one, and the feasibility of the whole proposition lies in the fact that by including all there is a tremendous economy effected; the business will pay, and it will not be necessary to increase prices.

To show the hopeless conflict of interest between distributors and consumers, consider these high-class companies, with millions of capital and all the paraphernalia known to the trade. They are conducted by honorable men, men of broader gauge than would ordinarily be found in charge of smaller concerns.

The first duty of the management is to make the business a success; that is, make it pay. It can do this only by pleasing the public; but the public may be pleased by a fancied as well as by a real benefit; and it is well agreed to among business men that the fancied benefit must be catered to whether it happens to be the real benefit or not.

So that the duty to conscience, the joy of performing real service for one's fellow man, however strongly it may be felt, takes only third place among the operating influences in the manager's mind.

The practical value of such an equipment is that such a company may buy milk of any quality, clean it, separate it, put it together again in whatever proportion it may please and sell it, today or tomorrow or some other day.

Clean milk will keep longer than is generally supposed. Cleaning and cold storage together will keep milk sweet and wholesome for many days.

Milk cannot be made perfectly clean, that is absolutely free from bacteria, by any commercial method; but it can be made practically so by pasteurization. Buddeising is perhaps a better method. This is a Danish treatment, in which advantage is taken of the peculiar ability of a certain enzyme in the milk (catalase) to decompose hydrogen peroxide and impregnate the milk with nascent oxygen. But the method followed as yet in this country is to heat the milk short of the cooking point and follow this by thoro chilling.

When well done, this process, pasteurization, offers considerable protection. It does not sterilize, yet it may make milk safe for food which previously was dangerous.

But its most certain result, a result that may be obtained even when the work is not well done, is that the milk will keep longer.

All bacteria have not the same power of resistance: some are much more easily disposed of than others. Among those that are tenacious of vitality are, unfortunately, some of the most malignant; while the one most easily destroyed is that interesting specimen, the *bacterium lactis,* which is responsible for the peculiar phenomena of souring.

This particular bacterium is one of the most plentiful of all the low forms of plant life and is much more harmful to the milk trade than it is to the consumer.

It is the active agent in the fermentation of sugary solutions of all kinds, causing them to sour when exposed. It is present in the air everywhere and in the digestive tracts of all animals. It is found in immense numbers in the upper bowels of the babies even when only a

few days old, and so far from being injurious is it that its absence may be taken as an indication of illness.

The change that this bacillus effects in milk does not spoil it for food. It sets up a peculiar fermentation of the milk sugar by which lactic acid is developed, and with the change in the milk from alkaline to acid the caseine is spontaneously precipitated from solution and appears as a curd. This change is really a step in digestion, and not at all an unpleasant one. It is subsequent changes, mixed and delayed fermentations, that spoil the milk. Buttermilk owes its virtues to lactic acid: fresh milk soured with a pure culture is wholesome, digestible and delicious.

This bacillus exerts an inhibitory influence on the growth of other bacteria. When left alone it gives warning. When it is destroyed there is no warning. When it is destroyed the milk may be old, other bacteria may be present in large numbers unannounced, or even it may be that putrefactive changes have set in, and yet the milk remains alkaline, it is saleable, it keeps.

Pasteurization is done with machines in which the milk is heated in thin layers fully exposed to the air. This drives off odors; another advantage, such as it is.

But none of the machines on the market is automatic and it is really the operator that is responsible for its results. They commonly run too rapidly and the milk is almost never kept at the pasteurizing temperature for the full period of twenty minutes.

It is quite possible to make milk worse instead of better by this process. This will be the case if the temperature is raised too slowly and afterward the chilling not thoro and immediate. It is not at all unlikely to happen if the operator has his mind on only the one bacterium that I have described and allows himself to become less and less painstaking, so long as his product does not sour.

In the solution of the milk problem it must not be overlooked that the interest of consumers is bound up with the interest of producers.

It is shown in "An Analysis of the Milk Supply of 200 Cities," published by the Agricultural Department, that the per capita consumption varies from a quarter of a pint a day in some of our large Southern cities where the supply is inadequate and unsatisfactory, to as much as two pints a day in favored Northern towns where the supply is from wholesome sources close at hand.

A perfect distributing system would increase this consumption in all cases.

If this plan is carried out in such a manner as to avoid the unnecessary expenses, expenses that do not profit the consumer; saving the large sums that can be saved by systematic delivery; omitting advertising and soliciting expenses; saving waste and furnishing a full line of wholesome, inexpensive comestibles; the distributing business will be under control, and the financial and scientific questions will be also under control. Then the problems of the dairy may be taken up.

It is as good as certain that the best milk for household use is not the milk that is richest in cream. Native or grade cows are to be preferred to thorobreds for all around richness, flavor and even balance of nutritive values.

If cities learn how to get what they want they will soon learn to specify and to pay for it. It is not too much to anticipate that there will be an evolution of new breeds to meet the wants of the city delivery and the different needs of the different kinds of milk products.

BRADFORD, PA.

The Case of Senator Smoot

BY ALBERT J. HOPKINS

[The Hon. A. J. Hopkins, United States Senator from Illinois, is a member of the Committee on Privileges and Elections, and joined with three other Republican members of the committee in a minority report favorable to Smoot. Associated with him in this minority report were Senators Knox, Beveridge and Dillingham. The article has added interest because it takes a position in opposition to the propaganda carried on by women's clubs and religious and semi-religious organizations. As the case is pending before the Senate now and Senator Burroughs is pressing for a vote on it at this session the article is of extreme present interest.—EDITOR.]

THE grounds on which the seat in the Senate of Reed Smoot, of Utah, is contested are as follows:

First, that he is known to have taken what is spoken of in the testimony before the committee as the "endowment oath," by which he obligated himself to make his allegiance to the Church paramount to his allegiance to the United States.

Second, that by reason of his official relations to the Church as one of its Apostles, he is responsible for polygamous cohabitation, which yet continues among some of the Mormons, notwithstanding it is prohibited by law.

The charge that Senator Smoot is himself a polygamist was never seriously pressed before our committee. He is, and always has been, opposed to the practice of polygamy in the Church, and in the State of Utah has been one of the bitterest foes of polygamy.

The evidence that was offered on the first proposition relating to the endowment oath was of a character that would receive but little consideration in a court of justice. The witnesses contradicted each other as to the wording of the oath and its character. Some of them were shown to be of bad repute, others mentally unsound, others drunkards, and others who had private grievances that so warped and distorted their opinions and statements that they were entitled to but little, if any, credence.

There were only seven of all the witnesses who testified against Senator Smoot, who attempted to give the endowment oath. These witnesses were contradicted not only by the positive testimony of Senator Smoot himself, but by a great number of witnesses whose character and reputation for truth are unquestioned. In my opinion, the charge relating to the endowment oath was not only not sustained, but the clear preponderance of the testimony showed that there was nothing in that oath that interfered in the slightest degree with Senator Smoot taking upon himself the obligations of a Senator of the United States, and performing faithfully and efficiently the duties of that great office.

The Senator himself said that he took the endowment oath when he was a youth of eighteen years, and that, as he remembered the oath, there was nothing in it that conflicted with his duties as a citizen of the State or of the United States, or with his duties as a United States Senator. He went further than this in his statement before our committee, and stated in substance that when he took upon himself the obligation of Senator of the United States he took it without any mental reservation whatever and with the full determination to discharge his duties in the spirit and letter of the oath.

Much has been made by the general public out of the fact that he holds an official position in the Church itself, being one of the Twelve Apostles. Those

who would have him expelled from the Senate claim that, by reason of this position, he is responsible for polygamous cohabitation, which yet continues among some of the Mormons in Utah. This is the most serious charge that has been pressed by those who seek to have him expelled from the Senate. To understand fully the nature and character of his position as one of the Twelve Apostles and his responsibility—or, rather, non-responsibility—for the practice of some of his associates, it is necessary to challenge the attention of the public to the attitude that the Government of the United States has held toward the Mormon Church, and those who are the leaders of the Church, in preaching and practicing polygamy.

The Federal Government is in part responsible for the polygamy that we find in Utah today. President Fillmore, in 1850, gave both recognition and encouragement to the practice of polygamy in the Mormon Church in Utah by appointing Brigham Young, the head of the Church, Governor of the Territory of Utah, with full knowledge that he was an open advocate of polygamy and at the time had a number of plural wives. The Senate of the United States confirmed that appointment. He was reappointed by President Pierce and reconfirmed to the great office of Governor of Utah by the Senate of the United States. For many years polygamy was taught by Brigham Young and his followers as one of the doctrines of the Church, without any interference upon the part of the general Government; and plural marriages were entered into without objection or any legislative hindrance.

There has been much legislation by the Congress designed to prohibit both plural marriages and polygamous cohabitation. The successive acts were fought thru to the court of last resort, and then came the "manifesto" of Wilbur Woodruff, forbidding further plural marriages. At the time it was issued there were 2,400 polygamous families in the Territory of Utah. There were, in 1905, over 300,000 members of the Mormon Church in the State of Utah; of this number there were only 500 polygamous families. Since the manifesto of 1890 very few plural marriages have been entered into by Mormons. Time is the great corrector of this evil. The 2,400 polygamous families of 1890 had dwindled to 500 in 1905. In a few more years the 500 will be down to five or perhaps entirely eliminated from the Mormon Church. No new polygamous marriages are recognized or permitted by the Church.

From the fact that, under the statutes of 1882 and 1887, the children of plural wives were legitimized, it has been felt unwise by many of the non-Mormons of Utah to prohibit the fathers of such children from living with, supporting and caring for them. And if the father was to support, educate and care for his children, it seemed to many heartless to exclude from this relationship the mother, who had entered into this relation from the purest of motives and at a time when she believed that, in the sight of God and man, she was justified in entering into this relation.

Senator Smoot, by the determined stand that he has always taken, has been one of the great factors in the Church in stamping out polygamy. He has not only lived up to the spirit of the laws of our country and the manifesto of 1890 of his Church, but has been an active and earnest worker in the Church to spread the sentiment that no more plural marriages will be tolerated.

The testimony that was taken before our committee shows that one of the bishops of the Church who violated the manifesto and the laws of our country by taking a plural wife outside the limits of Utah, when he returned to the State was prosecuted by Senator Smoot before the courts of the State and was also deprived of his official position in the Church by the direct influence of Senator Smoot.

Since Reed Smoot became one of the Twelve Apostles of the Mormon Church in 1890, the conditions in Utah have been such that the Gentiles as well as the Mormons have acquiesced in a polygamous cohabitation with those few remaining who married before the manifesto of 1890.

They have recognized that such polygamous cohabitation is an evil, but that the interests of society will be best subserved by permitting time to elim

inate the few polygamous families, comparatively, that yet remain.

Reed Smoot himself has never had but one wife. He is a model husband and father, an honest and upright citizen in every respect, and has made an honest, painstaking and conscientious official as a representative from his State in the Senate of the United States.

The people of Utah have the same right to elect their Senator from the Mormon faith that the people of another State have to elect their Senator who is a member of the Methodist, Presbyterian or Catholic Church. There is nothing in the life or practice of Senator Smoot that in any way, in my opinion, disqualifies him from performing the duties of United States Senator. The people of Utah have elected him as one of their Senators, and I see no valid or legal reason for interfering with the choice of the people of that State for this great office.

WASHINGTON, D. C.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Senator Spooner

THERE'S a mixture of anxiety in the interest with which we are watching Senator John C. Spooner, of Wisconsin. He is a man who does not ask for sympathy and would be slow showing that he appreciated it. But he has a heart, deep under his stern exterior—a big heart of a real human being, little as he shows it to the public. He feels for others vastly more than the others give him credit, and he knows it better than most when others appreciate or depreciate him. You'll find it true if you have the real thing in you, and watch him carefully.

But Spooner never indicates stress of weather by change of front. He is not that kind of man. It is only straws which show the way of the wind with him. We must watch the straws.

Indeed the nation is doubtless more troubled and annoyed than Spooner himself anyway over the threatened danger that he may be ousted from his seat in the Senate. If it came about in any way but the way it seems to be coming, it is quite believable that Spooner would be better pleased than pained. He is no milk-and-water fighter, and if he chose to enter the game of scalping knives it's a good guess that his brown thatch would not be the one to slip. But Spooner is too big a man—too proud, too much of a national giant—to enter a local factional fight, especially when it is his own scalp at stake. Therefore the nation's anxiety.

If Spooner wanted to he could. No one doubts that. But there is grave fear that he will not take the trouble. He does not say so, but it is the impression one receives in talking with him. Besides, he is tired of the blasts of false trumpets which have been blowing about him for no possible reason but that he is what death and slander like—a shining mark.

These things have less outward—and less real—effect on Spooner than on almost any one imaginable. The country believes in him. He believes in himself. But that the constant racket has "got on his nerves" one can't well help believing, and he admits that the noises bother him and hamper him. In short, he is evidently inclined to break away—and more's the pity.

All his life has been an instance of office seeking the man—frequently seeking in vain. He was twice offered positions on McKinley's Cabinet—once the Attorney-Generalship—and a place on the United States and British Joint High Commission, but declined them all. Six years ago he notified Wisconsin that he absolutely refused to be a candidate for re-election, but they re-elected him just

the same by a vote of 105 to 27. The change that is whispered of is most unfortunate.

In spite of all that is said to the contrary, Spooner is not rich. Again, in spite of a lot to the contrary, since he came to the Senate he has invariably refused private practice, having taken but

SENATOR SPOONER.

two retainers during the entire time. The other evening I asked him why, referring to Bailey's claim that a Senator had a perfect right to all the private practice he could secure which did not conflict with his public responsibilities.

He said: "If I take a case in court I lay myself liable to be called upon when I want to be giving my entire attention to the Senate. I cannot run the risk." With such convictions a lawyer of his national repute would do better for himself outside than under the toga. He has little inducement to fight for it, if Wisconsin thinks to the contrary.

Senator Spooner is sixty-three by the time-table, but it is Time's fault, not his. Some one else has kept the tabs. His head—mostly forehead and eyes—is crowned with a shock of brown hair that has hardly a frostbitten strand in it. His smooth-shaven face, slipping down like a wedge from a big forehead to a pointed chin, is solemn and seamed, but not with age wrinkles. Up to the limit of togal dignity his step is as springy as the best. To meet him casually one feels himself in the presence of a stern man, buried in thought beyond the trivial incidents of life. To know him intimately—as intimately as is possible with such a man—is to realize a consistent, earnest friend, without either social or sensational embroidery, grave and dignified always, but bristling with dry humor and good counsel. Neither one does he impress as a man beyond the most vigorous prime of life.

There's not a chair in the Senate less frequently vacant than Spooner's, or a Senator more constantly on the alert when legislation is in progress. You see his head toss back, his eyes half close, his ear cock toward the Speaker. You know there's something wrong. He'll be on his feet in a second to challenge it. It is so all day and every day. One who has not watched incessantly has little conception of the real value of such a man as Spooner, constantly on guard.

When he stands in his favorite pose, leaning against his desk, one hand in his pocket, the other shaking at the man he is challenging, you instinctively think him a large man. It makes the surprise all the greater when you see him athwart such men as Dolliver or Penrose and discover how small he is. Heenan, our colossal Odessa consul, showed his surprise on meeting Spooner in the cloak room, and catching it, Spooner exclaimed: "Good heavens, man! Do you expect a United States Senator to be over seventeen feet tall?"

Spooner is not a difficult man to ap-

proach—under favorable conditions. He tries to be courteous. He fetches a smile as far as his eyes. Sometimes it even catches the corner of his mouth for an instant. But he is an extremely hard man to *hold,* unless your mission is important. He is almost too busy to tell you so, except at home, where his wife, who is a charming pianist, aids him to prove one of the most effectively cordial men imaginable.

On the floor he is witty, eloquent, resourceful. There are few who know and observe so well the rules of the Senate and debate. Notwithstanding his brusqueness he has a personal popularity on both sides of the chamber, which gives him an incalculable prestige. His weakness is the same as Chandler's of yore. They are both firm friends of Tillman, but Spooner is as fond as Chandler ever was of twisting him to the exploding point, for the fun of seeing the sparks fly.

The country will lose too much if Spooner leaves the Senate. It ought not to be thought of.

SENATOR JOE BAILEY.

The Lion in a Snare

We are watching Joe Bailey, of Texas, because we can't well help it. We'd much rather watch him in his seat in the Senate, over the aisle from Spooner, or stalking solemnly down the avenue, his big head covered by his broad-brimmed felt, his long, black coat never forgetting constitutional decorum, however tempted by the breeze; or swinging down the corridors at the Capitol, head and shoulders above everything but Penrose and his ilk; his eyes the color of gray shadows in the night, covered with a kind of film, like the eagle's when he doesn't care to see. We'd rather be watching him on the floor of the Senate, his head thrown back in his inimitable self-assurance, his long, raven-black hair drifting down over his forehead, to be tossed back now and then by an over-delicate hand—over-delicate for one of Bailey's size and pugnacity—before he shakes a white fist at Spooner or hurls a crisp sentence full of bristling words at distant Foraker, or sends a biting bit, with something like a sneer, to where Lodge sits trying to smile like Patience on the monument. We'd rather watch his eyes flash, his hair fly back of itself, his chest expand as he denounces his "Man of clay" at the other end of the avenue. Alas, poor Yorick! It's pitiful to have to watch the lion struggling in the net, caught in some kind of a corporation tangle, in his own State, fighting with his own people for retention in the Senate, the butt of whatever opposing politicians may pick up and throw at him.

The Senate is sorry for Bailey. He is one of its proudest and most promising members, and for that the members love him in spite of his rather unsympathetic egotism. Bailey is a great man, and great men are often too beclouded by their own greatness to be thoroly human men. It is a divine gift which few great men possess—just as it is difficult to be severe and parliamentary at the same time. It is possible. Foraker is that kind. He is possessed of so much humanity that it sometimes threatens his greatness and weakens the arm that is striking a blow. Bailey is never troubled that way. He is great. He knows it and he means the world shall know it. That's the keen edge, to him, of the mess down in Texas. That's why some who

are not really his enemies are still chuckling, even while they are sorry for him—chuckling to see him off his high horse and heels, going barefoot thru a very common kind of mud.

If it were not Bailey and not just at this time—just after his rate bill magnitude and royal defense of himself against a charge of treason, the roar in Texas would not have caused a ripple in the atmosphere over the border. He made some grand strides toward the top last session. There were whispers of Presidential timber there, and that was the rub that lighted the match. It is Bailey's unique identity that catches the sting. He stands before his constituents and says: "Did you ever hear my most malignant enemy say that I ever cheated the State or the nation? They say I ought not to have borrowed money, but I'd rather borrow it than steal it."

That's all right. He might go farther and say that other members of the Senate have done all that he is *charged* with doing, that every one knows it and—what of it? But that would not better matters. Whether others do or not, Bailey will always feel that the immaculate record he has so often held defiantly to the front has been touched with tar. It will dull his individuality, which was one secret of his success. His vanity has been punctured. It will bring into evidence a fact which was hidden before, that he has been making more enemies than friends on both sides of the chamber, in spite of the fact that they all love him for his magnificent qualities.

He is only forty-three. He may grow more cordial with years. His face will fit admirably into a smile. At long intervals now a brief ripple betrays how well it might light up. If he has eyes to see it, this hitch will suggest to him the value of friends in need and the way to secure them, which will make him a greater man than ever when he has on his high heels again and mounts his high horse.

The Handsome Tillman of the House

John Wesley Gaines says he is about to get himself disliked. But he will have to try hard—harder than he will be able to try over the absentee business in which he proposes to accomplish it. For John Wesley Gaines is right, as usual, and in spite of the tempest of opposition which always greets his extravagant efforts, the House knows that he is right—as usual.

He will not succeed. Probably he does not expect to. But he will not get himself disliked. The House enjoys opposing him, just as the Senate rises against Tillman with its eyes shut. But the House would not know itself without John Wesley Gaines. His massive nose, between the masterly forehead and aggressive chin, held straight by two deep-in fiery eyes, and sheltered by a mass of iron-gray hair is something that needs not to have been seen before to be recognized offhand. He knows it and carries it about on as well trimmed and tailored a base as bears the brains of any member.

Sometimes the newest of the new may ask: "Who is he—that handsome man with the gray hair?" But oftener the new ones say: "That, there, must be John Wesley Gaines." And it is. There is no one like him or half like him. Tennessee would be prouder of him if she

REPRESENTATIVE GAINES

could, but she can't. She has reached the limit.

Gaines is Tillman sanctified and glorified. He is into everything that comes up the moment he can get in. He has words to burn on any subject under heaven the moment it is broached. He is honest. He is frantically earnest. If you want resounding rhetoric and oratory by the mile wait a minute. Gaines will be at it. He is all bumps and bruises and scars where members have tried to beat him back. "You keep out of my speech!" Grosvenor shouted at him once. But "Keep in!" is Gaines's motto. When some one discovers how to stop Tillman he may be borrowed, first, to dam Niagara and then to hold up Gaines.

The two men are as different as men could be—except that they are both Southerners and Democrats—but they are very much alike, nevertheless. Out of the hurly-burly Gaines is as pleasant to meet as he is to look at, barring a bit of Southern offishness till he is sure of you. He is ideal in his home, and Tennessee loves him, just as South Carolina loves Tillman, and will keep him in Congress just as long as he will stay. The Senate loves Tillman, and lets him run on, thinking it is paying no attention—but it is. The House loves Gaines—who is much more companiable than Tillman—and they let him run on—they have to—while they think they are paying him no attention. But they are. Look up the records and you will find that Tillman in the Senate and Gaines in the House get more of what they are after than almost any other members.

Down in Tennessee they started a song about Gaines which found its way to Washington, and every now and then you'll hear some one giving him a line of it just to liven things up a bit. It goes something like this—sung to any tune you happen to know:

"John Wesley Gaines, John Wesley Gaines!
Thou monumental mass of brains!
Old Tennessee relies on thee,
John Wesley Gaines."

That's Gaines, the handsome Tillman of the House, and it will be, for all time to come, just the same, even if he should happen to get his order thru to have absentees docked some $13 or so per day.

Ere the Caravan Departs

BY ROBERT GILBERT WELSH

Saith Hassan, seated in the gate—
"Sniffing the dawn, my camels wait
The drivers' cry to send them forth
From this vile city of the north;
From fur-clad Russ and Tartar thieves,
Whose oath no Worshipper believes,
To seek, a hundred leagues afar,
The gates of mine own Kandahar!

"There the bazaars extend for miles,
With rugs in many-tinted piles,
Silks from Bokhara, shimmering glass,
Vessels of silver and of brass,
Rose-jars and gleaming copper pots,
Melons and grapes and apricots—
Ah, me! what riches lie afar,
Yonder, in mine own Kandahar!

"My way across the desert lies,
Beset by murderous Mongol spies,
And therefore, with the holiest care,
My fine grave-linen do I bear;
That, as the Prophet's laws decree,
I may both cleansed and shrouded be
If Allah wills I die afar,
Upon the road to Kandahar!

"Tho in the sutures of my skull
My end is writ, I am too dull
To read therein my final day,
And so I smite my breast, and pray
That Allah, the Compassionate,
May bring me safe where white arms wait
Their lord and master from afar—
Yonder, in mine own Kandahar!"

New York City.

Literature

Ann Boyd*

THE heroine of Mr. Harben's new novel is a woman past fifty years of age. And she is one of the great heroines of the year in fiction. Moreover, she has gathered the threads of the story about her so closely that for the first time the author has met the demands of literary art in the construction of his book. Until now we have all felt that his strength lay chiefly in a certain charming rusticity of expression, in a witty confession of all the homely details of rural Southern life, and in his matchless interpretation of simple, honest folk who are autocthonous to the sun and soil of that region. But his most ardent admirers admitted that it was not always possible to apply the canons of literary art to his novels. There was a lack of tightness in the plot usually. The hero had a way of riding into "Darley" in the dark of the moon and meddling with it, or Harben would get sentimental and actually allow him to obstruct it altogether. In short, he seemed a man of genius, but not of sufficient severity and power to hold his own conception together to one logical, inevitable end.

This last book, however, bears not a single mark of this amateurish method, so common in the work of Southern writers.

The scene is laid among the hills of North Georgia, peopled with folk indigenous to that region, and the story turns upon incidents that are not imparted thru the imagination, but they belong inevitably to it, like the fragrance of cotton blooms. And he has not taken a novelty plot, worked out like a circus puzzle to engage the reader, but he has laid the issues of life in the human heart, that old battle ground of good and evil, which never changes from age to age. The dramatic emphasis falls properly first upon the "sturdy old Pariah," Ann Boyd, a narrow, noble woman, homely and of great strength of spirit, who wins fortune and even peace from the hard fist of any fate. Next, it rises like a terrible accent above the temptation of Virginia Hemingway. And this part of the story deserves particular attention as a work of art. It is difficult to give a pure young girl a sufficient and almost compulsory reason for risking her honor as did Virginia upon the occasion of the night visit to her rich lover; but Mr. Harben dwells incisively enough upon the animal terror of the girl's mother, who believes that she is dying of a dreadful disease, to supply Virginia with the reckless mood of sacrifice.

And finally the climax does not turn so much upon an incident as it does upon the slow working Godward of mighty, simple hearts, so primitive that they burn with bitterness, so near to Heaven even in their sins that they hear messages and are quickly moved.

In one place alone does Harben fall short, and this is in the momentary love scene between Virginia and Luke King. Nothing could be more absurd. And the fault is accounted for by the fact that Harben is a Southerner. Men of that region "make" love as well as or better than any others. They have a talent for it, just as some lawyers have a talent for "special pleading," but not one was ever born yet who can write about a love scene without appealing more to the reader's wit than to his sympathy. It is always such a "dead give away," so lacking in the last stand of coquetry in the woman. She invariably falls all in a heap and has to be supported hence by the hero. This is only what every Southern man wishes would happen, and he invariably writes it out that way.

* ANN BOYD. *By Will N. Harben.* New York: Harper Bros. $1 50.

Our Immigrants

IN view of the intense practical interest in the character of the nationalities that are settling among us, it is well that we should have studies analyzing the characteristics of the immigrants and their adaptability to the conditions here. The ordinary person is prone to judge the foreigner who comes into our midst by his outward appearance and

manner, and even some of our better trained observers approach a discussion of the immigrant population with prejudices and assumptions, failing to realize the essential good qualities which these New Americans, as Dr. Edward A. Steiner[1] calls them, possess, qualities which are of the warp and woof of their make-up, and which display themselves when the surface peculiarities and the faults due to adjustment to the environment have been modified or removed.

Dr. Steiner, professor in Iowa College, himself an immigrant twenty-five years ago, is a keen observer who has given us in picturesque style an insight into the lives of the immigrants that now come to the United States. He describes grapically these peoples in their Old-World *entourage* and their adaptability in helping to form this nation of the New World. He says: "I know the Slav, the Italian and the Jew better perhaps than I know the American, and . . . to know them as sympathetically as I do, one must know them without prejudice." This work does not belie his intimate knowledge as well as his sympathetic appreciation.

"What a people we might be, if we would appropriate all that the Jew brings of spiritual vision and cut down his business ardor and craftiness by our own emphasis of the nobler gifts; if we would receive the Slav's virgin strength and plant upon it all that we of older civilization have learned to hold precious; if we would enlist the German's thoughtfulness and thoroness and not imitate and encourage him in the trade of lager beer and the use of it."

The author regards the incoming peoples as splendid material for the making of our new nation; he believes that they are not, on the whole, degenerate or incapable of assimilation and transformation; and he is of the opinion that we shall not be the inheritors of a variety of disagreeable race characteristics. It is within the power of the present day American to utilize the material, replete with beauty and goodness. "At present the mass is still a lump of clay in the hands of the potter."

Dr. Steiner passed to and fro on the ocean liners a number of times, mingling with the several nationalities in the steerage, and he intersperses interesting accounts of experiences on these trips. He points out, however, the "indecent and inhuman" conditions surrounding the steerage passengers. "On the whole, the steerage of the modern ship ought to be condemned as unfit for the transportation of human beings." He claims that the price paid is large enough to entitle the passengers to much better treatment.

Another new volume dealing with the immigrant population[2] suffers somewhat by comparison. It is one of the Home Mission Study Course, and is dedicated "to the Christian women of America, whose mission it is to help save our country by evangelizing the alien women and teaching them the ideals of the American home." It contains valuable information culled from various sources, intending to show the intent of the immigration to America. Dr. Grose appears more apprehensive of the defects in the character of the immigrants; his point of view is not as broad and sympathetic as Dr. Steiner's. Tho there is plenty of good information about the immigrant in this volume, the reader should bear in mind that the immigrant has much to give as well as to receive.

A book[3] dealing with one class of immigrants coming here, the Jews of Poland, would have an enhanced value if the author, who spent eight years in Poland, would have shown more sympathy with the population she describes. She should have considered that the flexible character of the Jews leads them to act and re-act differently in Poland than they do in the United States. She speaks, in one case, of "real Hebrew interest" for money loaned by Jews as if it were peculiar to Jews to loan money at a high rate of interest, notwithstanding that Poles or Russians under similar conditions claim equally high or even more usurious rates. On the one hand, she points out the value of the Jewish business man to the Pole; on the other, she deprecates the necessity of employing him, altho realizing that where he does business the community prospers

[1] ON THE TRAIL OF THE IMMIGRANT. *By Edward A. Steiner.* New York: Fleming H. Revell Co. $1.50.

[2] THE INCOMING MILLIONS. *By Howard B. Grose.* New York: Fleming H. Revell Co. $0.50.

[3] THE POLISH JEW: HIS SOCIAL AND ECONOMIC VALUE. *By Beatrice C. Baskerville.* New York: The Macmillan Co. $2.50.

more than where he does not. She feels that the Pole has leaned too much on the Jew. "What the Pole lacks in business capacity and moral courage the Jew possesses to an extraordinary degree."

The volume contains a fair amount of information, much of it, however, doubtless gotten at second hand; it is by no means a deep study of the subject.

In describing the internal concerns of the Polish Jewish community, the author speaks of the permeating power of the recently organized Bund, which strives in Russia and Poland to establish a central autonomy of the Jews, to remove their disabilities and establish equal rights for them. The author's transliteration of Hebrew terms is not accurate, and it would have been preferable to have her spell Zionism with a "Z" instead of "Sionism."

Professor Wendell's Lectures

PROFESSOR WENDELL'S volume upon the national ideals of America* is chiefly interesting because it so perfectly illustrates the "lazy curiosity" which, near the beginning of his discussion, he sets down as a characteristic attribute of his mind, and which so perfectly typifies scholarly dilettantism in America. It is difficult to comprehend how a man who for a generation and more has been in a position of vantage from which to observe the currents of American political, social and intellectual life, should have had his provincialism so little disturbed by the almost universal intellectual unrest that marks contemporary America. His chief arguments are still based upon the assertions of Cotton Mather; his typical American statesman remains Daniel Webster; he finds little of significance this side of the Civil War except "our modern pratings of democracy," which fill him with grave misgivings as seemingly the utterances of "the evil prophets of some socialistic anarchy to come," and which constrain him to question whether "at this moment of crescent democratic force our world is passing into the dusk of a new barbarism, or into the dawn of a new dispensation."

Readers of Professor Wendell's books will remember how useful he found his analogy between the Calvinistic doctrine of election and the Darwinian doctrine of natural selection, in solving all the complications that present themselves to the interpreter of American literature. In his method it is important to accumulate only so much data as is the indispensable minimum for a generalization, or rather a formula which has the appearance of a generalization. A formula having once been phrased, the remainder of the task is easy. All that is necessary is to gather facts and to devise opinions which will fit in with the formula, and you have a treatise perfectly coherent, perfectly lucid, perfectly elegant, with all the appearances of mature philosophy and all the substance of an opalescent bubble. It is this method that with admirable ingenuity Professor Wendell has applied to the study of the national ideals of America —*Liberty, Union and Democracy.*

We cite for the convenience of the reader some of the formulae upon which Professor Wendell's discussion is based. In his introductory chapter upon American nationality, his aim is to differentiate the American from people of other nationalities. He writes of Daniel Webster, his defense of whom constitutes the most valuable, because the most vigorous, passage in the present book. "Different tho he was from Lincoln, different like Lincoln from you and me or from any other human being than himself, there was in Webster a quality which marks him as something different from the great men in other countries than our own, exactly as we have found Lincoln himself to be. Without analyzing this difference"—Professor Wendell is always careful not to confuse his argument with undue analysis—"any more than in the case of Lincoln, we can surely agree that this impalpable certainty is what made both Webster and Lincoln Americans." And what is this impalpable certainty which Professor Wendell takes it for granted that we must feel? "I for one," he answers, "have come to believe that the saving faith in order so deeply ingrain-

* LIBERTY, UNION AND DEMOCRACY, THE NATIONAL IDEALS OF AMERICA. *By Barrett Wendell.* 12mo, gilt top, uncut, pp. 327. New York: Charles Scribner's Sons. $1.25

ed in American character may be traced in no small degree to the neglected doctrine of election. Thruout the Puritan generations our ancestors never swerved from the conviction that most of us must always have our betters, and that our betters are better than we, not from any blind or unjust chance, but because it has pleased God to grant them the boon of eternal life." And in this life, lasting and absolute possession of our mines and our railroads and whatsoever other things may by divine right be theirs. One wonders whether Professor Wendell's investigations have ever led him across such documents as the Fundamental Articles of New Haven, of June 4-14th, 1639, published as No. 16 of Macdonald's Select Charters, whether he has ever chanced to read such an entirely unofficial document as Mrs. Stowe's Old Town Folks, whether he has ever reflected that it was just such a distortion, as his discussion illustrates, of the democratic principle upon which the New England colonies were founded that led to the bigoted and unreasoning tyranny of the clergy and the swift destruction of the Theocracy.

Jamaica. Painted by A. S. Forrest. Described by John Henderson. With 24 full page illustrations in color. New York: The Macmillan Co. $2.00.

Now that the world is shocked into thinking of Jamaica by the earthquake at Kingston this book is opportune. It is dedicated to Sir Alfred Jones, whose courage and presence of mind in this emergency did much to maintain order and restore confidence. He had a narrow escape from death as the pier on which he had been standing a moment before was submerged and the hotel to which he was going was demolished, but he immediately gave orders for the erection of 200 temporary shelters and sent a despatch to England saying that "the calamity would not interfere in the least with the progress and prosperity of the island." Mr. Henderson's study of Jamaica gives no evidence of having been profound or long continued, but a traveler's impressions of the country and its people are told in a satisfactory style. He is firmly convinced of the incapacity of the negroes and half-breeds for self-government and devotes most of his space to the expression of his amusement at their efforts to ape the whites in fashion and language. Many of the illustrations are very good, but some are reproduced in too crude colors even for tropical scenes.

The Political History of the State of New York. By De Alva Stanwood Alexander. 2 vols. New York: Henry Holt & Co. $5.00.

Mr. Alexander's history of New York politics covers the period from the birth of the State itself, in April, 1775, to the inauguration of Lincoln, the first volume covering from 1775 to 1832, and the second from 1833 to 1861. An immense amount of labor in investigation must have been required in the preparation of these books, and the exhaustive thoroness with which the work has been done is apparent from even a casual examination. There is scarcely a personage of any importance in the political history of New York whose name and character do not figure in Mr. Alexander's text. The principal criticism indeed of this history is that it devotes pages to the biographies of the multitude of politicians which might better be used for a study of the movements among the people which were the underlying cause for the events in which these men figured. In other words, the personal side of New York politics has been overemphasized. This defect deprives the reader of a feeling of continuity in the narrative of New York's political history, but while it is a defect it does not detract seriously from the value of the work. In these days when we are hearing so much about the virtues of our ancestors and the corruption of our own times in local and national politics there is much encouragement to be had from a work which shows so clearly as this does how far we have actually advanced in our notions of the proprieties of politics. Take, for example, the story of the foundation of the State Bank in 1803. Mr. Alexander tells us that the Republicans of Albany, realizing the importance of having banks founded in the State and desiring to avoid the opposition of their own party, obtained a charter for the State Bank by selling stock to the Republican members of the

legislature with an assurance that the stock could be resold at a premium as soon as the institution itself had an existence. The writer tells us that no one of prominence took exception to this way of getting a charter. Even that high-minded and sincere lover of his country and State, Erastus Root, subscribed for fifty shares in this legislative boodle fund. The bank got its charter. Today no candidate for the Legislature could possibly expect to be re-elected (even if he were not subjected to criminal prosecution) if it were known that he had taken part in a transaction such as this which a hundred years ago in the days of our great statesmen did not raise even the mildest criticism. Of the two volumes the second is likely to prove more interesting to the general reader, including as it does the important part which New York took in the issues of the Civil War and the great statesmen which she contributed to the debates of the war period. In view of the general excellence of Mr. Alexander's work it is to be hoped that a third volume may be added later, bringing the history further down to our own time.

The History of Early Christian Literature: The Writings of the New Testament. By Baron Hermann Von Soden. Translated by the Rev. J. R. Wilkinson; edited by the Rev. W. D. Morrison, New York: G. P. Putnam's Sons. $1.50.

A New Testament Introduction deals with the questions of the authorship and date, purpose and character, of each several writing of the New Testament. Professor von Soden has had a more extensive purpose in mind in his *Urchristliche Literaturgeschichte,* which now appears in a good English translation. He endeavors to bring the results of critical inquiry as to each several book into a unity, and to exhibit the entire literary activity of the first two or three generations of Christians as a whole, as the outcome of one great religious movement. He seeks not only to describe accurately each gospel and epistle, but also to show how one is related to the other and how together they make clear the ruling ideas and impulses of the creative days of the Christian religion. The book is thus not merely the history of a literature in the formal, technical sense; it is the history of the thought and life thru which that literature came to be.

As first in origin, the genuine Pauline epistles are first treated. In the second division, the Synoptic Gospels, the author distinguishes a collection of sayings by Matthew, one of the twelve, as the earliest bit of gospel writing. This was followed by the reminiscences of Peter, written by Mark, and only after these two independent works were complete was our present gospel of Mark compiled. Luke and our Matthew followed in the order named. Professor von Soden entitles the third group Post-Pauline Literature, in which he includes the Acts and Hebrews, I. Peter (pseudonymous), Ephesians and the Pastoral Epistles. He finds reason for placing these writings together at the time of the Domitian persecution, 92 to 96. The Johannine Literature is held to date from a still later period: The Apocalypse, a Jewish book worked over by John, "the elder," who was also the author of the three epistles of John; the gospel, a devotional meditation, not a biography, uniting in itself elements of Pauline and Alexandrian theology, along with true memorials of Jesus, the work of an unknown disciple of the Johannean school. The Epistles of James and Jude and the second letter of Peter are treated in an appendix, as quite outside the development of early Christian literature. Many of these positions may be thought radical, but it must be said that Professor von Soden presents a consistent, life-like picture of the growth of the New Testament literature, and relates the several writings to one another and binds them together into an orderly whole as has not been done in Introductions which have considered each book as presenting a problem by itself.

A Spinner in the Sun. By Myrtle Reed. New York: G. P. Putnam's Sons. $1.50

This new story, like all the others written by Myrtle Reed, appeals to that sentimental curiosity which tempts us to read the love letters of an elder generation, or to rummage for family relics in forgotten chests, or to walk with delight in an old-fashioned garden. The old

fashioned garden, indeed, is a part of the scenery in this book. But she has gone a step further this time and introduced a veiled lady with a mysterious sorrow. Now who else would have thought of such a heroine for a modern novel? The "veiled lady" went out along with "the woman in white" of whom Wilkie Collins wrote, and the ghosts who pattered up and down stairs in Bulwer's novels. But once more she moves before us in this tale, with her long veil sweeping back like white wings above her head. Never mind why she wears it, or what her sorrow is, or how and why it was lifted at last. There she *is*, a veiled lady in a modern romance, with a garden full of poppies and heart's-ease, and a chest full of wedding clothes that are yellow with age, and a tender-hearted, heavenly-minded gentleman to work in the garden, and to tell her all the flower-scented philosophy of goodness and forgiveness. If any doubt this, let them buy the book and read for themselves the lavender-scented story of the veiled lady and the sweet Pan Piper. The only trouble is that the author has resorted to narcotics in order to produce effects sufficiently weird in the minds of her characters, and, as is too often the case with women writers, she cannot quite achieve the dramatic without falling into the melodramatic. However, even these peculiarities may go with stories of veiled ladies, who are apt to be morbid.

Researches in Sinai. By W. M. Flinders Petrie. With Chapters by C. T. Correlly, M. A. With 186 illustrations and maps. Large 8vo, pp., xxiii., 280. New York: E. P. Dutton & Co. $6.00.

Large type, wide margins and thick paper make this a portly volume. But we must add that the numerous illustrations all appear in separate plates, and so add much to the weight and the attractive value of the book. To be sure, it is one of those volumes which are prepared for the purpose of providing funds for exploration, and is so made as fascinating as possible. Professor Petrie is one of the most competent and indefatigable of Egyptian explorers, and has written much on his own important discoveries. His late expedition to the ancient copper and turquoise mines of the Sinaitic peninsula is here described Unfortunately the Arabs have lately learned how to use dynamite in smashing up the rocks, and more damage has been done to ancient remains than in thousands of years previously. Therefore very wisely Professor Petrie has not only secured the photographs and records of all that remained, but he has been allowed to transport everything to the Museum at Cairo or elsewhere for permanent safekeeping. Most important of all is the discovery of a remarkable sacred temple and altar, which Petrie supposes to be Egyptian, going back to the third dynasty. We should have imagined the earliest remains to be less Egyptian than autochthonous, representing the primitive races which erected menhirs. But the full description, with the photographs, and the historical record of inscriptions from the extraordinary period of King Sneferu, are of very great value. We get a glimpse of the high culture at a date which Petrie puts at nearly 5000 B. C. He is a strong advocate of the longest chronology, as he puts back the first dynasty to 5510 B. C., in which he is not in accord with the German school of Egyptologists. Our chronology is fairly certain up to the beginning of the eighteenth dynasty, but between that and the twelfth there is great difference among scholars. Professor Petrie inserts the period of one whole rising of Sirius, which makes a difference of 1,460 years, a large additional space to insert in this uncertain period of a broken kingdom and numerous and probably contemporaneous kings. It seems to us that the shorter chronology better fits the facts as to Egypt, and our contemporary knowledge, slight as it is. But leaving this question aside, on which our author puts so much stress, these discoveries are of great value, and the work can never be repeated, for the carved monuments are now removed.

The White Plume. By S. R. Crockett. New York: Dodd, Mead & Co. $1.50.

This story opens on the eve of Saint Bartholomew, the 23d of August, 1572,

"when men with lanterns and pole axes, as if going to the shambles to kill oxen, hurried along the streets of Paris on their way to murder the Huguenot gentlemen who had

come to witness the marriage of Margaret to the King of Navarre, and who now lay asleep unsuspecting against the very hour of their doom."

And the book reminds us of the elder Dumas, partly because the author has chosen similar situations in French history upon which to found his story and partly because he has the old charm for spinning a tale full of intrigue and wild adventures. Not every one who attempts it can write an historical romance. To succeed now, an author must have a certain D'Artagnan quality of spirit, and he must be master of such levity, fierceness and grace in the use of words as shall remind the reader of a time when a man measured his way by sword lengths thru the world. What the historical novelist of the future will require in order to interpret this one into romance it is impossible to say, unless it will be a thoro knowledge of electricity and finance. The question is, Will posterity enjoy these phosphorescent dramas of this present age, as we delight in the white-plumed, sword-slinging tales of the past; or will men and women go on craving after the blood fringes of history, no matter how tame and altruistic they get? It is impossible to know, but it is hard to conceive of a time and of a type of mind which cannot appreciate a story like *The White Plume*.

Tacitus and Other Roman Studies. By Gaston Boissier, Professor of Latin Eloquence at the Collège de France, etc. Translated by W. G. Hutchison. New York: G. P. Putnam's Sons. $1.75.

Boissier's work was done with enthusiasm. With such a theme who could be cold? If Livy was the Herodotus of Roman history, Tacitus was even more the Thucydides. He did not care to dwell on the early history of Rome, which he knew to be largely fiction. In cold blood he searched the springs of action. Devoid of illusions, he felt that the great and cruel Roman Empire was a hollow mockery, which would one day collapse at the touch of the rude and honest Germans, whom he depicts in his "Germania." It is unfortunate that both his "History" and his longer "Annals" have come down to us in a fragmentary condition. What a continuous reign of horrors he records. Vespasian and Titus form an island in the turbid torrent and dry land is reached with Trajan. Some have refused to believe this tale of continuous horror. Voltaire calls Tacitus "that fanatic scintillating with wit"; and more serious historians have refused to believe that Tiberius is as bad as he is here painted, that when wearied by the number of accused persons, he emptied the prisons by wholesale slaughter. But Vellerius Paterculus, the most brazen flatterer of Tiberius, pities the poor prince for being obliged to kill off all his relatives until there remained only Caligula, the worst of the lot. Tacitus was, without doubt, genuinely depressed by these horrors. The translator had a pleasant task before him. While he deserves praise, he makes consistent use of "scarce" for "scarcely." He says "has beheld him close," "for long," "much blood had flown under his sway," "two twins," "imagined themselves to detect." Some similar infelicities might be added. In general, the lucid style of the author makes felicitous translation easy.

Zarathustra, Philo, the Achaemenids and Israel. Being a treatise upon the antiquity and influence of the Avesta, for the most part delivered as University lectures. By Lawrence H. Mills. Chicago: The Open Court Publishing Co. $4.00.

There are probably good reasons why this book was not issued at the Oxford Press. It is true that the author makes a good point in emphasizing the *entente cordiale* which existed between the Persians and the Jews, when the latter were brought back from the Babylonish captivity. The sympathy appears to have been real, and it rested doubtless on a kindred seriousness, in which religion was the bond. Cyrus appears in the books, Ezra, Daniel, the Second Isaiah and Second Chronicles, almost as a Jew inwardly. Darius also, the strenuous and fierce conquerer of twenty-three nations, as he declares on the great Behistun inscription, appears as one whom the zeal for the "God of heaven" had "eaten up" and whose mission it was to mete out just punishment to the wicked and let the oppressed go free. All this need not exclude the suspicion that statecraft had much to do with forming the bond.

It seems ungrateful to refrain from praising a work which seems to have cost so much labor; but from the first words of the preface, "Thankfully reporting my general circumstances to be favorable," to the end of the book, there is so much involved construction and verbiage, combined with misprints, that the author's "reasons are as two grains of wheat hid in two bushels of chaff." It does not enhance our confidence in the writer when he says, "I confess that it (an analogy) is a very subtle one, and only thrown in for a very esoteric circle," and when he speaks of "interior investigation," and "what I have, perhaps, wantonly called a quasi objection." The author seems hurt because a former colleague has come to the conclusion that the Gathic parts of the Avesta are not so old as he formerly thought. It did probably require some courage for a Zend scholar to declare that the literature in which he was particularly interested could never be regarded as anywhere nearly as old as the Vedas. But for this courage of his convictions our author treats him as a renegade, saying: "We heard a voice which seemed to utter impeding principles. A prominent expounder suddenly retracted his clear words, or rather superseded them without retraction—turned his back upon some of the leading facts which he had himself in his first edition presented —I had kept silent, tho deeply wounded at the turn events had taken." Do scholars not have a right to change their views when new light comes!

Literary Notes

....*Nelson's Encyclopedia,* the latest general work of reference, has reached its tenth volume, Prescription to Saxony, leaving two more to complete the set. The plan adopted in this work of using numerous small illustrations is certainly more commendable than the usual American custom of using a few large and showy pictures. If the publishers had gone farther and left out some of the rather crude color prints it would have been still better.

....One of the most important events of the season in the operatic world is the production of Strauss' "Salome," at the Metropolitan Opera House, in New York, next week. We shall have a review of the performance in our next Music, Art and Drama number, but wish to call attention here to the publication by the John Lane Company, New York, of a little book by Lawrence Gilman, containing an outline of the text by Oscar Wilde and an analysis of the exceedingly complex and startlingly original music with citation of the most important motives.

....Any one contemplating the adding of a book to the 60,000 new volumes that are published every year would do well to read thru *The Building of a Book,* just published by the Grafton Press, New York ($2.00). It is also a very handy book to have on the open shelves in the public library. Every stage of book making, from the preparation of the manuscript and its sale to a publisher to the final disposition of the book to the retailer and the public, is described briefly and clearly by competent experts. There are thirty-seven chapters by as many different authors, discussing such topics as press work, paper making, proofreading, illustrating, binding, advertising, reviewing, etc.

Pebbles

"How did your dog-show result?"

"Oh, it was a howling success."—*Harvard Lampoon.*

WHAT has become of the old fashioned man who, the morning after a snow storm, caught the school teacher and washed her face in the snow? *Atchison Globe.*

"MADAM, could you give a starving woman work?"

"I might. How many afternoons off would she expect a week?"—*Courier-Journal.*

WHEN she called him lovey dovey
His face with passion glowed.
Not tender love, but anger,
For he was pigeon-toed.
—*Harvard Lampoon.*

HONK! HONK!

HOCUS—They tell me Jones has got himself into bad odor.

POCUS—He has; he's bought an automobile. —*Princeton Tiger.*

OUR HAPPY HOME—A SONG OF THE FIRESIDE.

OUR home is very happy now,
And mamma's blithesome song
Of sweet, contented peacefulness
Is heard the whole day long.
Us children run about the house
And raise a perfect gale.
Our home is very happy now
Since papa went to jail.

REFRAIN.

Since papa went to jail, aha!
We never have a row,
And we are glad
They've collared dad,
For home is happy now.

When papa used to come home jagged
And thump dear mamma blue,
And every time he got a chance
Would lick us children, too,
We thought such conduct after while
Became a little stale;
But home is very happy now
Since papa went to jail. —*Puck.*

Editorials

A Dual Tariff

At the convention held in Washington last week, to promote an extension of our foreign commerce, reciprocity in tariff rates was a leading topic. By general agreement discussion of the question of a comprehensive revision of the present tariff was avoided, and the convention sought to ascertain how our trade relations with other countries could be improved without such a revision.

"In my judgment," said Secretary Root to the convention, "the United States must come to a maximum and minimum tariff." When President Roosevelt remarked at the banquet a few hours later that "what Mr. Root has said to you has my full and unqualified indorsement," he could not have forgotten the Secretary's plea for a dual tariff, altho a report of his speech shows that he had especially in mind other parts of the Secretary's address. By resolution the convention expressed its approval, asking Congress to provide for a minimum tariff measured by concessions not exceeding 20 per cent. of the Dingley duties, and to authorize the President to offer and use such concessions in negotiations with other countries.

It is quite probable that we shall come to a tariff of maximum and minimum rates—a two-story tariff, as some have called it—but it may not be practicable to establish such a tariff without a general revision. A dual tariff is rightly to be desired by the United States, provided that the minimum rates are not too high. Why? Because other countries are using such tariffs, reserving the minimum rates for use in reciprocal agreements, and we need a similar instrument in dealing with them. France and Germany have dual tariffs; Canada is about to put one in force, together with a third series of preferential rates for imports from Great Britain. In some instances this form of tariff has been suggested by our own very high duties and the refusal of our Senate to ratify treaties of reciprocity.

We need a tariff in this form also because experience has shown that the Senate, as we have said, will not accept treaties of reciprocity even after they have been negotiated by a protectionist President. The Dingley Tariff law provided for the negotiation of such agreements and permitted the President to concede in them a reduction of even 20 per cent. from the duties established by that law. But action upon a series of treaties negotiated by Mr. Kasson, with the approval of President McKinley, could not be obtained in the Senate. Because the Senate's approval of such agreements is withheld, our export trade with Germany is now in danger of being subjected to the high duties imposed upon the products of countries that will concede nothing in exchange for tariff favors. If we had a minimum tariff (as well as a maximum) we could exchange it for Germany's minimum, if our minimum rates were reasonable.

There is a valid objection to reciprocity by treaty, in that, after such a treaty has been made with one country, other countries may demand from us the same concessions upon the ground that they are in equity, or by some existing treaty, entitled to them. It is true, moreover, that a series of such treaties of reciprocity might work great changes in our tariff as a whole without open discussion or the sanction of the representatives of the people in the House. If a dual tariff—which is a provision for general, rather than for special, reciprocity—should be established, it would be the result of action in both the House and the Senate.

But the minimum rates, if there are to be such rates, should not be those of the present tariff. There will be a demand for such a minimum by those who would make a maximum 20 per cent. higher, piling Pelion upon Ossa. It is quite clear that Speaker Cannon would make a dual tariff in this way. There are highly protected manufacturers who would stand with him. But we do not think they are influential enough to control a majority in Congress, or even a majority of the Republican members, on this question.

It was intended by those who made

the Dingley tariff that its rates should be reduced (not increased) for use in negotiations for reciprocity. Several of them have said so. There is proof of it in Section 4, which expressly provided for reductions, up to 20 per cent., in reciprocal treaties.

Mr. McKinley (and surely he was loyal to the protective policy) would even have surrendered entire duties in such agreements. "If perchance some of our tariffs," said he in his last public address, "are no longer needed for revenue, nor to protect our industries at home, why should they not be employed to extend and promote our markets abroad?" It is a minimum obtained by reductions, and not a minimum represented by the present tariff, that President Roosevelt and Secretary Root have in mind.

The Republican party in Congress will not pass any bill making a two-story tariff with the Dingley rates for a ground floor. It could not afford to pass such a bill, and the adoption of a dual tariff on that basis would defeat the purpose of the legislation by preventing negotiations with foreign countries for an exchange of concessions.

Before the adoption of a tariff of maximum and minimum rates, or with the adoption of it, the present tariff should be revised. Many of the duties in it are too high. In some instances a large part of the rate is no longer needed for protection, but serves to assist combinations in maintaining prices made high by a suppression of competition in the home market. An attempt to pass a bill for a dual tariff will inevitably cause discussion of the whole question in and out of Congress, and this discussion may cause revision.

The Luminosity of Day

THE radiant James Roscoe Day, S. T. D., Chancellor of Syracuse University, is a self-luminous orb in the fearsome depths of intellectual and moral space. When the brightening beams of his mentality shine upon this little planet, the cowardly shadows of pessimistic trepidation flee far away.

But for the luminosity of Day, we might indeed imagine that the present state of man is untoward. There are spirits that take to gloom, as the eyeless monsters of the deep take to sea-bottom darkness. They tell us of injustice and cruelty, distressing our minds with visions of poverty, of haggard faces, of frightful illnesses and injuries, all side by side in this beautiful world with fabulous wealth, with wanton luxury, with light-hearted selfishness and irresponsibility.

Some of these disturbers of our peace we have come to know all too well. There is young Mr. Patterson, for example. Unmindful of that high station in life to which it pleased the Inexplicable to call him, he has gone a-wantoning with proletarian socialism. And there are the Phelps-Stokeses—young Dr. Graham and wistful Rose! In their hearts there is no guile. But what painful things they say about "the existing social order"! They tell us of tenement house conditions that are distressing, and of the cupidity of a solvent ecclesiastical organization which opposed tenement house legislation. They expound to us the unrighteousness of capitalism, which extorts and exploits, wringing profits from the bloody sweat of the poor, that billionaires may wax mighty and splendiferous.

These persons are not wilfully disagreeable. They are only inadequate. They are lacking in an overflowing, irrepressible, contagious satisfaction in our ripe and golden civilization "as is." Forever they fix their despairing gaze upon the mere ethereal vacancy that distends and expands the saccharine and substantial doughnut. If they gaze into the starry spaces of infinitude they can only sigh with Carlyle, unhappy son of Ecclefechan, "Eh! Lord, but it's a sad sight!"

To turn from a philosophy so depressing to the warm and palpitating optimism of Day, what relief, what joy! Day the Chancellor, Day the radiant, Day the all-sufficient! Day—as Mr. Khayyam said of another—"He knows, he knows!" He has turned the eye of his intellect upon all dark recesses of the Social System, and has exposed the childish mythology that once peopled them with billionaire Bluebeards and other capitalistic monsters. With mere gleams of intelligence

scintillating here and there, he disperses noisome horrors that had settled upon alumni banquets and Christian conventions.

And how beautiful the world becomes when the light so shines! Under its rippling play the multi-multi-millionaire ceases to terrify. He is seen to be a gentle, harmless thing, with a heart as pure and tender as a babe's. He goes about doing good, lavishing his fortune upon universities and Bowery missions. He loves the poor, and gives reverent thanks to his Creator for supplying him with so many of the poor to be good to. It is true that Satan also goes about—Day doesn't deny this, for he is a very honest man—but Satan's roar is no longer what it used to be, and his digestion is impaired. In fact, Satan no longer disguises himself as an angel of light. In sheer desperation he has been obliged now to put on the humble garb of trade-unionism, and about the only evil thing he is at present able to do is to fight the open shop.

It may be that the full effulgence of the millennial age is not yet all here. But the morning light is breaking. That, at any rate, everybody but Patterson and the Stokeses can see with half an eye. Day's in his Syracuse. All's right with the world!

Book Lists for Librarians

"WHAT is the best book on earthquakes?" "Where can I find something about Jamaica?" "How big is Kingston, and what sort of people live there, and what difference would it make to the world if it were sunk and who is Sir Alfred Jones?" These are a few of the questions that are just now bothering the reference librarian in every public reading room, provided it is a live library and the people of the neighborhood have got the habit of coming to it when they want to know anything. The distressed lady who has to get up a paper on Jamaica for "the club" by next Saturday afternoon, and who does not know anything about it except in connection with ginger; the editor who wants to expand a syncopated despatch of fifty lines into a decent column; the general reader who likes to read up on current topics, so as to get them into their proper perspective; the school teacher who has to talk to the pupils on the causes of earthquakes at half-past eleven o'clock tomorrow; all these and half a dozen other people want something definite and want it right away. A vague reference to the cards, the encyclopedia and the periodical index will not satisfy them, and the librarian has to do too much else to be able to become an impromptu specialist on all subjects. It is so provoking that interesting things are apt to happen in out-of-the-way places, just as eclipses are mostly visible only in Central Asia and New Zealand. If you have a tender tooth, that is the one you want to chew on, and if there is a lacuna in the library, that is the department the people will make a run on. Nobody can tell beforehand where an earthquake or a message from the President is going to strike next.

It is for the purpose of assisting readers to get what they want when they want it that we start this week a new department in THE INDEPENDENT, to contain brief bibliographies of current topics. Every few weeks, whenever something of special importance occurs, we shall publish a list of the best books and magazine articles bearing on the subject. These lists will be printed in the advertising pages, so they can be cut out without injuring the file of THE INDEPENDENT, because this is in itself one of the most useful of reference books on current topics. If librarians watch for THE INDEPENDENT's Book Lists, and, just as soon as they are received, paste them up on the bulletin board in the public reading rooms, they will be saved a good many questions. Before posting a book list, those volumes and periodicals which are in the library should be marked by underlining in red ink, and the call number added or reference given to a special shelf on which the books are placed.

Our Book Lists will not be neutral and complete, but critical and selective. We shall eliminate trashy and pretentious volumes as far as possible, but shall try to include all those that are of interest for some reason and to explain in a brief note what that reason is. In the prepara-

tion of these lists we shall have the assistance of well known librarians and of specialists in various departments of research. The list we publish this week apropos of the Kingston earthquake was largely prepared under the direction of Mr. John Cotton Dana, librarian of the Newark, N. J., Public Library, by his First Assistant, Miss Beatrice Winser. The Newark library is one of the most progressive in the United States and all librarians know how useful its bibliographies are.

The special feature of our Book Lists will be their timeliness. THE INDEPENDENT goes to press with such promptness that we shall be able to put into the hands of our readers the titles of the best references on some current event within three days after it has occurred; that is just when such references are most needed. Many of our large libraries publish comprehensive bibliographies of subjects of permanent interest, those of the Library of Congress are especially valuable, but they are not usually issued oftener than quarterly or monthly. Besides those relating strictly to the topic of the week we shall publish occasionally select lists of the best books on subjects of perpetual interest, which will be useful to study clubs and to persons who want to pursue a definite course of reading and make it count, instead of devouring whatever printed indiscriminatingly matter happens to come into their hands. We have already on hand such lists on municipal ownership, immigration and socialism, mentioning books on both sides, with hints as to their value and bias.

The curse of the book business now is the enormous number of unnecessary new books. This is injurious alike to readers, publishers, authors and librarians. The author has to rush out a new book every year or he is forgotten. Both publishers and librarians would be better pleased if the people would call for the books they already have instead of asking for the latest. But the reading public only hears of the new books in advertisements and reviews, so it neglects the older and often better books already in stock. It will be our aim to give in these Book Lists the best books still in print on the subject regardless of whether they are old or new.

Criticisms of the French Law

ONCE more the Pope forbids the French Church to accept, or act under, the French Separation law, or the new law. His condemnation of the first law last August was in these words:

"While the law remains as it is we declare it is not permissible to try these other kinds of association so long as they do not establish, in the most legal and positive way, that the divine constitution of the Church, the immutable rights of the Roman Pontiff and the bishops, and their authority over the temporal affairs of the Church, particularly the sacred edifices, will be irrevocably protected by such associations."

The new law pleases him no better, and he still forbids.

This is the main criticism which the Pope and the opponents of the new law make. This is what Cardinal Gibbons and Archbishops Ireland and Glennon say, and all the others. What they seem to us to fail to do is to show by definite quotation from the law, and explanations of its bearing, just how the authority of the Church over the conduct of worship is endangered. Their language is as general and indefinite as that of the Pope.

The demand then is, that French law must, "in the most legal and positive way," recognize and "irrevocably protect" "the immutable rights of the Roman Pontiff" over "the temporal affairs of the Church" in France, and "particularly the sacred edifices." That is a pretty stiff demand to make, and such a law it would not be easy to enact in this country or in France. And yet we fail to see that the law does not allow the Church in France full control of its temporal affairs.

To be sure, it puts the financial affairs of the local churches in the hands of boards of trustees, called associations for worship, but that is a common thing in this country and preferred in many dioceses. In Prussia these boards are elected by the people, and the Vatican submits. In the Separation law it is not stated how they shall be appointed, nor that they shall be composed of laymen. M. Briand says they may be composed entirely of priests. The bishop can organize them as he pleases. That would naturally be the course taken, and that would protect the eccle-

siastical rights as well as if it were said that the bishop or the Pope must create the associations.

But it is said, or may be, that divisive and heretical associations might be organized to seize and hold the churches and hold hostile services in them. The law provides against that. It says:

"These associations must have for their exclusive object the exercise of a particular form of worship."

If it be a Roman Catholic church which is held by an association, it has no power to give it over to anything else, and the bishops have the full management and definition of Roman Catholic worship. Further, the duties of the associations are strictly limited to "maintaining the cost, upkeep and public exercise of a religion"; that is, of the "particular religion" of which the law speaks. They have no authority to meddle with the forms of worship. Their powers are carefully defined. They may rent seats, collect fees, receive contributions from the faithful, hold funds, and must prepare an annual inventory of property and account of expenses. Not a word gives them authority to conduct the worship. That is managed by the rules of the "particular religion."

But the Pope and the critics of the law say that, in case of rival associations claiming property, the courts are to decide which is to hold it, and that this right of decision should belong to the bishops. But that is precisely what is done in this country. Here Catholics go to law, as in the case of Bishop Bonacum, and our courts decide which has the right. But we are told that our courts decide that within the Church its decisions of ecclesiastical procedure are final, and so we recognize the Church. Exactly so; and exactly so it would have to be in France. In case of rival claims, the French courts could not fail to recognize ecclesiastical decisions in matters ecclesiastical. It is not to be assumed that the French courts would be less fair than American courts. If they are not to be trusted, then it is of no use to discuss the justice of the law.

The Pope and American critics further contended that, on declining the privileges of the Separation law, the Church could not organize associations under the general laws, because, while the present Minister of Worship might allow associations thus formed to hold the churches, and to make notifications only once a year of their intention to hold them, a succeeding Minister might forbid them to use the churches, and might require notification for every separate meeting. Unlikely as such contingencies were, the new law meets both objections. It definitely gives such associations formed under older laws the right to hold the churches, and declares that annual notification is sufficient. And yet the clergy are forbidden to form even these associations. The right of the Roman Pontiff must be "in the most legal and positive way established." It appears to us that the Vatican is asking for the form when it has the substance. We agree with the French bishops, who by a majority of 22 agreed, before the Pope forbade, that they could organize associations under the Separation law, and safely hold their churches and keep their pensions.

Pneumonia Once More

ABOUT this time every year in our large cities the mortality due to pneumonia becomes a marked feature of the mortality report of the Health Department. As cities grow larger this becomes more and more noticeable. In spite of all our advance in hygiene and sanitation the mortality from pneumonia has not decreased, but has actually increased, and that not alone in proportion with the increase in the population, but to a much more serious degree. In New York City, for instance, there were over 1,000 more deaths from pneumonia in 1906 than in the preceding year. This would seem to be an alarming state of affairs, and it has been exploited by the sensational press, and will continue to be the subject of scarehead articles until the milder weather has come once more.

There is no doubt that pneumonia has actually increased in frequency to some extent, tho not by any means to the extent that seems to be indicated by the mortality record. A considerable share of the deaths in pneumonia—more than one-half of them—occur in children under five years of age and in old persons

beyond sixty-five. With regard to both these classes of patients it was not the custom, until comparatively recent years, to seek out the direct immediate cause of death so carefully as is done at the present time. For instance, now, if a child suffers from measles or whooping cough and develops broncho-pneumonia which proves fatal, the death is attributed in the mortality records to the pneumonia rather than to the original infection, tho formerly the child was said to die from the measles or the whooping cough. Most of the weakling children who suffer from gastro-intestinal trouble, with consequent mal-nutrition, develop pneumonia before the end, and so their death certificates are written out in this category. Old people above seventy used to die of old age in the good old days, but now they die of pneumonia. Practically any form of cold that becomes serious in an old person will lead to the development of pneumonia, tho formerly such patients used to be set down as dying from the bronchitis or capillary bronchitis that was the real beginning of their fatal sickness.

Considerations such as these take away from the mortality records of the disease not a little of their serious significance, in the sense of lessening the idea of the great increase of this fatal affection. There is no doubt, however, that pneumonia has become, in the words of one of the most distinguished of our clinical authorities in medicine, "the Captain of the Men of Death." Tuberculosis used to be the most serious foe to humanity, but now its colleague in the realm of pulmonary diseases has surpassed it. This must not be thought, however, always to represent a serious calamity for human nature. The weakling children who are carried off by pneumonia would only be a care if they were to live, as a rule, and the terminal affection of the lungs is often a blessing in disguise. As for old persons, seeing that death is inevitable, no more kindly mode of taking off could well be invented than this pulmonary process, which, by reducing the oxygen intake, blunts the sensibilities and makes the progress toward death nearly as little painful as it is possible to be. Pneumonia is surely the Angel of Death and a beneficent messenger if we remember how painful and protracted some of death's methods may be.

With all these considerations, however, it must not be forgotten that there is an actual increase of pneumonia among even healthy adults, and that the disease is every year claiming more and more victims in proportion to the population. The main causes of this are that, as population grows thicker, dirt and dust of all kinds, as well as the exhalations of others' lungs, get into the air we breathe and become sources of infection. Nearly always within a few days before a man develops pneumonia he has been in a crowd somewhere, usually at a moment when his resistive vitality was lowered because of over-fatigue or some disturbance of digestion, or the loss of a meal or sleep, or some emotional stress or worry. It is typically a disease of the city rather than the country, and is not due to exposure to cold nearly so much as to the inhalation of infectious material from other persons. These causes for its development furnish the best hints for its prevention.

As to its treatment, not much can be said beyond the fact that all symptoms which develop must be promptly met and treated, in order that they may disturb as little as possible the patient's health and strength. Besides this, the most important thing is that there shall be a plentiful abundance of fresh air, and that this shall be admitted directly to the room. The presence of several persons in the room must not be permitted, and lights and other sources of atmospheric vitiation must be, as far as possible, excluded. In our hospitals better results are obtained by treating patients suffering from pneumonia out in the open air, on the roofs of hospital buildings, or under tents in the yard, than in any other way. A distinguished Canadian specialist in pulmonary diseases declared that he would rather be treated under the trees in the park than in the best appointed hospital in the city.

As to the fatality of the disease, the expression of the old English physician two centuries ago must not be forgotten. He said: "It is much more important to know what sort of a patient has the disease than what sort of a disease the patient has." The outcome in pneumonia

depends much more upon the condition of the patient before the disease developed than on the severity of the attack itself. This is, of course, a general rule to which there are exceptions, but the exceptions are few and far between. All depends on what the patient takes into pneumonia with him. If he has an affection of the heart to begin with it will be a miracle if he escapes with his life. If there was any kidney disease when the pneumonia began, then he will almost surely die, overwhelmed by the toxins of the pneumonia, which he is unable to excrete because of the condition of his kidneys. If when he was younger he suffered from tuberculosis his recovery from pneumonia is much more doubtful than would otherwise be the case. The recovery will usually not begin by crisis with rapid convalescence, but will come by lysis and a long, slow climbing up of the hill to health. This represents more nearly what is known about pneumonia at the present time than any sensational reports with regard to the disease; and it makes clear the necessity that those who already know themselves to be suffering from diseased organs are under of taking precautions that will enable them to avoid a disease which is almost sure to be fatal if it comes.

Teaching Genesis

Over ten million persons in the United States and Canada are now engaged in the study of the first book of the Bible. Something like a million men and women of North America are attempting from week to week to instruct children and youth in the fascinating and important subjects which the Book of Genesis introduces. This would seem a fair conclusion from the fact that for four months and a half the International Sunday School Lessons are from Genesis, and that there are on this continent over twelve million Sunday school scholars and a million and a half teachers, the great majority of whom follow the lessons recommended by the International Committee.

From every point of view young people should be well grounded in the marvelous narratives of the early chapters of the Bible. The stories of the creation and the fall of man, of the deluge and the confusion of tongues, of the call of Abraham, the cunning of Jacob and the fortunes of Joseph, are among the fundamental intellectual treasures of our civilization, as essential to a knowledge of literature and history as is the multiplication table to a knowledge of mathematics. For a large number of the ten million students of Genesis it will be sufficient to bring out the facts concerning these narratives, as they stand plainly written in our English Bible. Genesis is the book of the childhood of the world, and its chapters are composed of the stories of the childhood of the Hebrew people, and with children it is a pity to do anything more than tell the stories and let them make their own impression.

With older minds, however, serious questions will arise in the study of this old book. Is the first chapter in harmony with modern science? How can the account of creation in the first chapter be reconciled with the statements in the second? Even if we interpret the story of the apple and the serpent somewhat figuratively, was there really a fall of man? Was there ever a universal deluge? If so, were the innumerable species of animals preserved in an ark of gopher wood three hundred cubits long? Does the Tower of Babel story explain sufficiently the multiplied languages of the earth? Are the narratives of the patriarchs trustworthy history? There are a host of such questions which Genesis provokes, and a well-informed person of inquiring disposition will meet with serious problems in almost every chapter.

It will not be advisable to thrust back all difficulties, and refuse them consideration, for such procedure prevents knowledge and in the end is harmful to faith. Neither should these stories be dismissed as "fables," "childish myths and legends," for whatever their literary character they are an important source of information of the early life of the world, and rightly used they yield rich treasures of historical knowledge, as well as many a moral and spiritual lesson of real value. The wise policy is frank recognition of all difficulties, honest interpretation of the text without ef-

fort to alter its meaning in order to bring it into harmony with modern ideas, and especially patient, sympathetic study of the stories themselves, to discover, if possible, the sort of life from which they came and the religious beliefs to which they testify.

One should surely endeavor to learn something of the contributions which modern scholarship has made to our knowledge of the early periods of the world's history. The literature on the topics related to the study of Genesis is enormous, and one could more readily recommend a library of reference books than a volume or two. It is probable that a commentary is not the book which most readers would find most helpful, for commentaries have an exasperating way of telling you what you already know and leaving your perplexities unresolved. Still in Canon Driver's "Genesis" there is honest attempt to meet the problems an inquirer is most apt to raise, in a spirit of fairness to all views and with careful, scholarly interpretation of the text. The early chapters are well handled in Professor Mitchell's "World before Abraham," the book which cost the author his professorship at Boston. The best commentary in any language is the German "Hand-Kommentar" by Hermann Gunkel, of Berlin. The introduction of this book has been translated, but it bears the forbidding title "The Legends of Genesis," which has probably kept many English readers from what is likely the best presentation of the literary character and historical origin of the early chapters of the Bible.

One might learn how not to contend for Genesis as against science by reading the Huxley-Gladstone debate, as contained in the files of the English reviews and in Mr. Huxley's volume, "Science and Hebrew Tradition," and reviewed in Andrew D. White's "History of the Warfare of Science with Theology." Few scholars would now undertake to defend the opinions represented a generation ago by Gladstone, Guyot, Dana and Dawson. Interest has now passed from the relation of Genesis to science to the matter of the connection of the stories of Genesis with Babylonian and Assyrian tradition. Since the publication of George Smith's "Chaldean Account of Genesis" in 1875, information of early Semitic life has increased marvelously, and a flood of light has been thrown on many passages of the Bible, especially the earliest chapters. The popular desire is that these discoveries confirm the Biblical account, but as a matter of fact the monuments do not so much establish or refute the statements of the Bible as they increase our knowledge of the times and the peoples when and among whom it had its origin. Any one who is led by the study of Genesis to familiarize himself with the marvelous history of the ancient Semitic world may count himself most fortunate. On this theme alone whole libraries have been written, but in works like Professor Rogers's "History of Babylonia and Assyria," Paton's "Early History of Syria and Palestine," Worcester's "Genesis in the Light of Modern Knowledge," one is well introduced to this fascinating study. More thoro investigation of the parallels between Genesis and the monuments would take one to Schrader's "Cuneiform Inscriptions and the Old Testament," and for an over-enthusiastic statement of the indebtedness of Hebrew religion to the Babylonians might be mentioned the lectures of Professor Delitzsch on "Babel and Bible," which stirred such interest in Germany.

For child or student no book of the Bible presents greater interest than the book of Genesis. A thoro grasp of its problems is almost a liberal education in ancient history and literature. The layman who turns to its study today may call to his aid a large host of patient investigators and thoro scholars, and careful use of the products of their labor will strengthen one's impression of the worth of the Scriptures and their profitableness in many ways.

Transfer of the Kongo Free State

To call the Kongo territory a Free State reaches the nadir of absurdity. There is far less freedom there than in Russia. The Government is an anomaly, a despotism centered in one man, such as China never knew. The King of

Belgium claims to own the mis-called Free State, and rules it just as he despotically pleases, solely to the lining of his own pocket; and now that the world is aroused, and the only men that have had a tongue to tell the truth, the missionaries, Protestant and Catholic, have stirred the world by the recital of horrors committed, the King proposes to give the whole country, with certain reservations, to Belgium, to be governed with him as King and predominant ruler.

What right has he to give away this mighty territory to Belgium? The royal domain which he proposes to retain is ten times the area of Belgium, altho only one-tenth of the Kongo State, but as large as New York, New Jersey and Pennsylvania combined; and he proposes, so it is reported and believed, to require that all concessions hitherto made to companies shall be validated. Is this to be allowed?

Let it be remembered that the King of Belgium did not discover or open the Kongo region. That was done by Mr. Stanley, an American explorer, afterward a resident of England. It was assigned to him as trustee, and a supposed generous giver to the opening of the country to trade, by an international conference, which could not agree to split up the territory among rival claimants. The United States, tho not actively a party to the conference, agreed to its conclusions with the expressed promise that the natives should be properly protected. That this condition has not been fulfilled is notorious; and the proposal to transfer the ownership of the country to Belgium is intended, so far as possible, to conceal the past and continue the policy of spoliation and destruction.

It must be held in mind that King Leopold is not owner, is only trustee, and has no right to give the country to Belgium without permission of the Powers which created the Kongo Free State. That this is so is clear not only from the history of the Conference of Berlin, but is shown by subsequent international events. In 1894 Great Britain wanted to get a strip of the Kongo State, so that it might have the uninterrupted right of way for a railroad from Cairo to the Cape, but while King Leopold was willing to make the trade, France and Germany protested, resting on their rights, and Leopold was forbidden to dispose of a narrow strip of his land along the western coast of Lake Tanganyika. What the Powers then forbade King Leopold to do, he proposes to do now, and a hundred times as much, giving the whole dominion to Belgium. The Powers should not allow it, and the United States should add its protest.

While the purpose of this proposed transfer is to escape the odium of the cruel misgovernment of the Kongo State, there is no evidence or likelihood that the conditions would be improved. King Leopold would still be supreme with the companies he has established to exploit the country and oppress the people. The Powers should either withdraw their consent to allow King Leopold to rule the Kongo State, or should appoint a commission with power to see that the purposes for which its government was given to him are carried out; and one of them was the protection of the natives of the land.

The Centennial of General Lee

The centennial of the birth of Gen. Robert E. Lee was celebrated last Saturday in many towns, North as well as South, and much was warmly said in his honor. General Lee was, with General Stonewall Jackson, the most attractive figure in the fortunes and misfortunes of the "lost cause." He did all that any man could do against overwhelming odds in men and money. He was not a rabid secessionist, like Jefferson Davis, and he left his rank of Colonel in the United States Army to fight the nation, solely because he had accepted the theory, now discredited by the decision of war, that his first loyalty was to the State of Virginia. We can imagine the pain it gave the son of General Lee, Light-horse Harry of Revolutionary fame, to lift his sword against the nation which the Virginian Washington had created. For Washington he had unbounded admiration and it was his own

father who gave Washington his accepted title of "First in war, first in peace and first in the hearts of his countrymen." The country forgives Lee and Jackson, as it does not forgive Davis. We honor the integrity and the honest purpose of the chief of the Confederate Army, who fought bravely and to the end, and then yielded to the arbitrament of war, and accepted the result. He was a man of the character and ability which exalt a nation. Some say that he was abler in defense than in attack, but the battle of Gettysburg had to be fought, for the advance across the Potomac was the only desperate chance left to the Confederacy. It failed, and the whole country not only submits, but is glad that so brave a fight in so poor a cause ended as it did. In that battle General Lee settled for all time the doctrine of State rights which had deceived him into his unhappy decision to follow where Virginia led.

The Clap and the After-Clap

The Kingston earthquake was bad enough, with its hundreds of lives lost, and a third city prostrated and burnt. The sympathy of the civilized world was again aroused, as on the disasters to San Francisco and Valparaiso. The United States Government hastened to send food and medical stores, and our vessels were the first to arrive; but in the most brusque and even insulting way the very superior Governor Swettenham, British ruler of Jamaica, ordered Rear Admiral Davis to re-embark his men and take away his surgeons, supplies and marines and clear out, saying that he needed no help. It was a piece of rudeness seldom equaled and what in British language would be called "nasty"; but it is too small a matter to have any international significance. Not every man knows how to take offered assistance graciously, and we may suppose that Governor Swettenham was hardly himself, excited as he was by the extraordinary conditions. Surely apologies will be made and we presume that the Governor will be reprimanded by the Home Office. Certainly our own people will have too much good sense to hold Great Britain responsible for the *gaucheric* of one ill-mannered Briton. We have enough such men ourselves.

"Not a Subsidy"

Perhaps the new shipping bill is not a subsidy bill, as its promoters declare it is not, but nevertheless it does subsidize in a measure. It is not a general subsidy bill to create an American commercial navy, but it does propose to create and help a certain class of steamships, swift enough and large enough to carry the mails to certain ports and to be of service in time of war. The amount of subsidy is called payment for carrying the mails, and amounts for the several lines to from $1,200,000 to $3,600,000 or $4,800,000 a year. So far as this is more than the mails could be carried for at open contract it is a subsidy and in line with our protective policy for manufactures and agricultural products. And yet we do not object to it. When all the other countries subsidize their shipping we have to do the same. It is the subsidies that create and support the lines which now make it necessary for our merchants to send goods to Europe, to be there transshipped for South America. Just so all the European countries got into the way of subsidizing the beet-sugar growers, until the evil became so great that they had to end it by mutual agreement. Conditions being as they are, we doubt not that this subsidy—for we call it what it is in large part—will help our direct trade with South America, and we are willing that the bill, as urged by Secretary Root, should become a law, for we live under conditions and not a theory.

The Carlisle Indian School

We do not take alarm at the rumor that the Senate Committee is going to report the Indian Appropriation bill with the familiar item of over $150,000 for the support of the Carlisle Indian School omitted. That school has made too many friends and too fine a record to be thus summarily wiped out of existence. The little flurry of opposition will doubtless pass by and the school will continue its career of victory over barbarism in red

men and football. But it must be confessed that this seems to foreshadow the logically inevitable. Public schools are springing up around and among the Indians, and for several years the Indian Office has admitted that its school service was topheavy with non-reservation schools, largely the fault of local legislation by Congress. In these schools are gathered nearly 40 per cent. of the Indians whom the Government is educating, and the task and expenses of recruiting and transporting these pupils is a heavy addition to that of maintaining them. Several schools, as well as Carlisle, carry their pupils well into a high school course, have a fine equipment for teaching trades, and have established and are extending the admirable "outing system," which originated with Carlisle and is its most valuable asset. They have all the modern improvements, from bathtub to individual gardens, and the Indian youth take to it all with a readiness and an intelligence which rejoices their friends and surprises their enemies. But the greatest need of the Indian today is individualism and initiative, with a touch of competition. This, which tribal life stifles, is not developed by the methods and machinery which belong to every large, well-managed institution. Many an Indian will get it quicker by "hustling" near home than by being benevolently coddled in a far away school, even of the best sort. It must be recognized before long that many of these non-reservation schools have had their day. They have a scaffolding use, but are not to be counted as permanent structures.

Presbyterian Breadth

There has been published the inaugural of James G. K. McClure, D.D., LL.D., as president of the McCormick Theological Seminary. In it he speaks well and strongly of fresh scholarship and broad Christian faith. He tells us that the world does not know how broad Presbyterianism is, how wide it opens the door of its membership to all whom God himself would receive—"what God would ask an applicant at the door of Heaven." That is nearly true—perhaps not quite so, for we are not sure that a Presbyterian church would receive such a man into its membership as Montefiore, of whom the second Dr. Hodge, Professor of Theology at Princeton, said that he believed the famous aged Hebrew philanthropist had gone to Heaven. But it is true that the Presbyterian Church asks no candidate to subscribe to its creed. But that seems to dodge the point, for the real test of breadth is concerned not with the admission of lay members, but the acceptance of its preachers. Does it allow free breadth, with the simple Christian faith, to its ministers?—that is the question. And this is what President McClure fails to give us information about. The pledge which a Presbyterian Church officer must make is quite different from that made by a communicant, and is somewhat strict, altho broader in practice than it is in text.

The recent riot in Atlanta has given rise to two leagues, one civic, the other religious, composed of people of both races, having for their object to improve the relations between them. Ex-Governor Northen is a member of both of them, and president of the Civic League. In its interests he has been visiting the principal cities of Georgia, and he finds growing support everywhere. But he says he hears one question asked him which he cannot answer. How is it, they ask, that Governor Vardaman can offer $300 reward for arrest of the three white men who murdered an innocent negro farmer, while nothing is done to discover and arrest the murderers of the negroes who perished at Atlanta?

What Paris is thinking of is shown in the attempt to raise a demonstration last Sunday, not against the Separation law, but against a labor demonstration that threatened the peace. Without difficulty, but with much energy, Clemenceau kept the peace of the city. But the most curious thing is that the object of the administration was to force the merchants to close their shops on Sunday a week or two before the law begins to go into effect. A Sunday fight for Sunday observance. Only they call it a "hebdomadary" rest day.

Financial

The Mercantile National Bank of the City of New York

F. Aug. Heinze, who has just been elected president of the Mercantile National Bank, was born in Brooklyn in 1869, and was educated at the Polytechnic Institute and at the School of Mines of Columbia University. In 1889 he entered the mining business in Montana. He built a smelter in Butte in 1893, and three years later constructed railroads in British Columbia. In 1900 he bought control of the State Savings Bank of Butte and the Silver Bow National Bank of the same city. Since 1903 he has been president of the United Copper Company, and he has large mining interests in Montana, Utah and Idaho.

F. AUG. HEINZE.

Miles M. O'Brien, the president of the New Amsterdam Bank, is first vice-president of the Mercantile, and the second vice-president is Edward R. Thomas. The third vice-president is Chester Glass, who was born in London, Canada. After practising law in Toronto he went West to engage in mining and real estate business. He is interested in coal lands in Pennsylvania and in real estate on Long Island, and has lived in New York for three years.

The Mercantile Bank was founded in 1850. The names of its presidents, together with the dates of their election, are given below:

January 4, 1850.....Wm. B. Douglas.
April 1, 1856.....Dan H. Arnold.
July 30, 1867.....Eli J. Blake.
November 18, 1873.....Norman White.
June 20, 1877.....Isaac Odell.
December 7, 1880.....George W. Perkins.
January 10, 1883.....Wm. P. St. John.
July 7, 1896.....Frederick B. Schenck.
January 8, 1907.....F. Aug. Heinze

The capital of the bank is $3,000,000, the surplus is $4,000,000, and the total resources as shown by the last report were over $30,500,000. The directors, in addition to the four officers above named, are: William Ballin, William F. Carlton, Stanley Gifford, Arthur P. Heinze, John F. Kehoe, Seth M. Milliken, O. F. Thomas, Charles W. Morse, Harry F. Morse, Dick S. Ramsay, Max H. Schultz, William Skinner, Robert M. Thompson, Warner Van Norden.

....It is shown in the annual report of President Richard M. Hurd to the directors of the Lawyers Mortgage Company that the company's sales of guaranteed mortgages in 1906 were larger than ever before, despite the higher rates for call and time loans. The amount was $22,959,685, and the net increase of $13,577,369 made the total outstanding $54,454,150. There was an increase of 565 (or 41 per cent.) in the number of customers. Net earnings were $333,389, or 13 per cent. on the capital. The company's mortgages are distributed in the boroughs of New York as follows: Manhattan, 66 per cent.; Brooklyn, 29 per cent.; The Bronx, 5 per cent. They have been placed under safeguards and limitations wisely imposed by the company's rules, and in 1906 there were but two foreclosures, involving a total of only $21,250.

....The statement of the Lawyers

Title Insurance and Trust Company, of which Edwin W. Coggeshall is president and general manager, has been issued, showing gross earnings of $2,543,820 and expenditures of $1,811,226, and leaving a profit for the year of $732,594. The capital stock is $4,000,000, the surplus is $5,500,000, and the undivided profits are $448,243, the increase of undivided profits for the year having been $162,530. The total assets are $17,302,289. The cash and securities making up these assets have been certified to as correct by Haskins & Sells, certified public accountants.

....According to a recent report of the Central Revenue Department, at Berlin, Germany has 7,049 millionaires (in marks), and 3,108 of them reside in that city. There are about 2,000 having between 2,000,000 and 5,000,000 marks; 425 who possess between 5,000,000 and 10,000,000; 100 whose wealth lies between 10,000,000 and 15,000,000; 44 who are classed between 15,000,000 and 20,000,000; 2 whose property is between 25,000,000 and 30,000,000; and 23 who are worth more than 30,000,000 (or $7,140,000). That is to say, the number having more than $3,570,000 is 69.

....At the annual meeting of the Irving Savings Institution W. H. B. Totten was re-elected president and Samuel S. Conover, formerly president of the Irving National Bank, was elected chairman of the finance committee, which in other savings institutions corresponds with the treasurership. William Harris Douglas, president of the New York Produce Exchange, was recently elected a trustee of this institution.

....The Russo-Chinese Bank, of St. Petersburg, with branches in France, Russia, China, Japan and India, has opened an office in this city. Its general agent is W. Kutzleb, and its paid up capital is seven and a half million dollars. Its reserves and participation of Chinese preferred Government bonds are ten million dollars and the total assets are over one hundred and sixty million dollars.

....John F. Harris, Henry Rogers Winthrop and Theodore E. Cunningham with Julien Ashton Ripley as a special partner, have formed a banking house under the firm name of Harris, Winthrop & Co., with offices in this city and Chicago. Mr. Winthrop is a Yale man and a son of the late Buchanan Winthrop, and was formerly assistant secretary of the Equitable Life Assurance Society.

....To its 1,350 miles of trolley road, the New York, New Haven & Hartford Railroad Company has added the road from Bennington, Vt., to Hoosic Falls, N. Y. It already owns a road, nearly completed, from North Adams, Mass., to Bennington, and this latest acquisition carries with it franchises for an extension to Troy.

....The new statement of The Empire State Surety Company, of which William M. Tomlins, Jr., is president, shows a surplus of $115,167, a capital of $750,000, and total admitted assets amounting to $1,351,773. The assets represent a clean lot of securities, a list of which is published on another page.

....The ore properties recently leased to the Steel Corporation have been valued for taxation at less than $30,000,000. As Mr. Hill, in his testimony before the Minnesota Railroad Commission, gave them a value exceeding $400,000,000, it is said that the State will attempt to recover unpaid taxes on that valuation.

....In December, 2,236,153 tons of pig iron were made. This is the highest record for a month. The year's total was about 25,350,000 tons, which shows a gain of 2,360,000 over the output of 1905, and of 7,220,000 over that of 1904.

....Marshall J. Dodge and Murray W. Dodge, sons of the late Arthur M. Dodge and grandsons of William E. Dodge, Sr., have been admitted to partnership in the banking house of Bertron, Storrs & Griscom.

....The number of failures in 1906 (9,384) was smaller than in any previous year since 1882; owing to a few bank suspensions, involving large sums, the liabilities exceeded those of 1905 by about 1½ per cent.

....Exports of manufactures in the calendar year 1906 exceeded $700,000,000. In the fiscal year 1806 they were only $258,000,000.

Insurance

Fifty Years of Service

WILLIAM B. CLARK, president of the Ætna Insurance Company, of Hartford, celebrated on Friday of last week the fiftieth anniversary of his honorable career as an underwriter. Mr. Clark was born June 29th, 1841. He attended school in Hartford and the high school in New Britain and finished his school career at Gallup's College Green School, in Hartford. On January 19th, 1857 he entered the service of the Phœnix Fire Insurance Company as an accountant, where he remained eleven years, the last four of which he acted as secretary. On December 1st, 1867, he became assistant secretary of the Ætna. After filling this office for twenty-one years he was elected vice-president, and four years later, or on December 1st, 1892 (the twenty-fifth anniversary of his coming to the Ætna), he was elected president. The Ætna Insurance Company, of which Mr. Clark has been president for fifteen years, now has nearly $16,000,000 of assets and a surplus as to policy-holders of nearly $8,500,000. Its payments on account of the San Francisco fire reached nearly $3,000,000 and in the eighty-eight years of its history it has paid total losses of $108,748,826.97. Its net surplus is now $4,466,072.43. J. Pierpont Morgan is one of the directors. At Mr. Clark's fiftieth anniversary in Hartford prominent insurance men from every large city in the East, including about twenty-five from New York, were present, and gave to Mr. Clark a large hammered silver loving cup. We congratulate Mr. Clark on completing fifty years of service in fire insurance underwriting. We also wish him many years more of life and active work.

WILLIAM B. CLARK.

SOMETHING like twenty British fire insurance companies have been represented by agents in the West Indies at Jamaica. The aggregate of insurance effected by these agents, according to press dispatches, is about $7,250,000, but all of the policy forms contained a safeguarding earthquake clause. It is consequently not at all likely that any of the interested companies will recognize liability of any kind. Joint action will doubtless be taken at Jamaica similar to that which followed the losses arising because of the fire following the Valparaiso earthquake.

THE following officers of the Prudential Insurance Company of Newark were elected last week: John F. Dryden, president; Leslie D. Ward, first vice-president; Forrest F. Dryden, second vice-president; Jacob E. Ward, third vice-president; Wilbur S. Johnson, fourth vice-president and controller; Edward Gray, secretary; Richard V. Lindabury, general counsel, and Edward D. Duffield, general solicitor.

....Bank clearings in this country in 1906 broke all records, amounting to $159,808,640,000, and exceeding those of 1905 by 11 per cent.

....Money in circulation in the United States on January 1st amounted to $2,883,900,328, which exceeded by $212,356,000 the amount reported one year ago.

The Independent

VOL. LXII NEW YORK, THURSDAY, JANUARY 31, 1907 No. 3035

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The Swettenham Incident

Governor Swettenham's treatment of Admiral Davis at Kingston excited much indignation and disgust there, and was deplored by the press of London and other English cities. Our Government decided to ignore it. Expressions of regret have been received at Washington from the British Foreign Office. It appears that the Admiral, upon his arrival in Kingston harbor, fired a salute in honor of Governor Swettenham before the reception of a request from the latter that this formality should be omitted, or that the Admiral's order concerning a salute was misunderstood. The Admiral hastened to apologize in a courteous letter, also referring to the landing of a patrol to guard the American Consulate, and expressing a desire, "for the cause of common humanity," to assist in clearing away wreckage and to give medical aid. He asked for the Governor's approval and spoke of the recovery, by his patrol, of a valuable safe which thieves had taken. This incident, he said, led him to think that the local police needed the assistance of his marines. On the following day (the 18th), Governor Swettenham sent to him this remarkable letter:

"DEAR ADMIRAL DAVIS—I thank you very much for your kind letter of the 17th, delivered to me this morning, for your kind call, and for all the assistance you have given and have offered to give us. While I most fully and heartily appreciate your very generous offers of assistance, I feel it my duty to ask you to re-embark your working parties and all parties which your kindness has prompted you to land.

"If, in consideration of the American Vice-Consul's assiduous attention to his family, at his country house, the American Consulate may need guarding in your opinion (he was present, and it was unguarded an hour ago) I have no objection to your detailing a force for the sole purpose of guarding it, but your party must not have firearms or anything more offensive than clubs or staves for their functions.

"I find your working party this morning helping Mr. Crosswell to clean his store. Mr. Crosswell is delighted to get valuable work done without cost to himself, and if your Excellency were to remain long enough I am sure almost the whole of the private owners would be glad of the services of the navy to save them expense.

"It is no longer any question of humanity. All the dead died days ago, and the work of giving them burial is merely one of convenience.

"I should be glad to accept delivery of the safe which alleged thieves were in possession of. The American Vice-Consul has no knowledge of it. The store is close to a sentry post, and the officer in charge of the post professes profound ignorance of the incident. I believe the police surveillance of the city is adequate for the protection of private property. I may remind your Excellency that not long ago thieves had lodged in and pillaged the town house of a New York millionaire during his absence for the summer, but this fact would not have justified a British Admiral in landing an armed party to assist the New York police.

"I have the honor to be, with profound gratitude and the highest respect, your obedient servant."

Admiral Davis's official report, corroborated by the testimony of civilians, shows that "yielding to the entreaties of the Colonial Secretary and the Inspector of Police, who spoke for the Governor," he had landed fifty marines to prevent a threatened revolt of the prisoners in the penitentiary. On the 16th, Secretary Root had asked the British Embassy whether aid from our ships at Guantanamo would be acceptable, and had received on the 17th, from the London Foreign Office, thru the Embassy, thanks for "prompt assistance rendered." On the 22d, Mr. Haldane, the British Secretary of War, sent to our Government a message in which, after a brief reference to Swettenham's letter, he expressed his "deep gratitude to the American Admiral for the generous assistance rendered

at a most critical time." Mr. Roosevelt replied cordially, offering further aid if it should be needed before the arrival of British ships at Kingston. Then there was received by our Government a message from the British Foreign Minister, expressing "deep regret that a British official should have addressed such a letter to the gallant Admiral who had rendered such valuable assistance to British subjects at a time of great suffering and distress," and saying he was confident that this feeling of regret was "shared by every one in Great Britain." Our Government replied that it would "pay no heed whatever to the matter" of the

SIR J. A. SWETTENHAM,
Governor of Jamaica.

letter. The diplomatic history of the incident was thus closed. It is reported that Swettenham has resigned. He docked the pay of Government clerks on account of their absence from official duty while caring for their dead or injured relatives. By the Council, the Mayor, the local press and Archbishop Nuttall he has been denounced. After his first great blunder, he sent brief letters of thanks for American aid, and explained that in his long letter to the Admiral he had "meant to be jocular." It is now recalled that the action of Admiral Davis, as a member of the Court of Arbitration which considered the sinking of English fishing vessels by a Russian fleet, was regarded with much gratitude by King Edward. The loss in Kingston is said to be $30,000,000, upon which there was insurance of $4,500,000, which the companies decline to pay.

Salaries and Pensions

After March 4th, 1907, the salaries of the Vice-President, the Speaker and members of the Cabinet will be $12,000, instead of $8,000, and those of Senators, Representatives and Delegates will be increased from $5,000 to $7,500. In the House a bill to this effect was passed without a record of yeas and nays. In the Senate, however, there was a call of the roll, and the vote was 53 to 21. Of those voting in the negative, 14 were Democrats and 7 were Republicans. The cost of this legislation will be about $1,250,000 a year. In the Senate debate, Mr. Berry, who opposed the increase, asserted that not half of the present members of Congress had ever made or could make $5,000 a year at any other business. On the other side of the question, however, it was pointed out that certain Senators had given up lucrative law practice for service in the Senate, and that the increase in the cost of living made it difficult, if not impossible, for a Senator to pay his legitimate and necessary expenses out of a salary of $5,000.——It is expected that the House will pass the Service Pension bill which was recently passed in the Senate. It provides that every Union soldier who served as long as three months and was honorably discharged shall, upon arriving at the age of sixty-two, receive a pension of $12 a month. This is to be increased to $15 at the age of seventy years, and to $20 when the pensioner is seventy-five years old. The annual cost of this legislation will be about $15,000,000, and $10,000,000 of this sum will be required for an increase of payments to those who now receive pensions. In connection with its action upon the General Pension bill (which appropriates $138,000,000 for the coming year), the House has voted to abolish all the existing pension agencies except the one at Washington.——An investigation of the International Harvester Company, commonly known as the Harvester Trust, has been undertaken by the Department of Commerce and Labor. The resolution for an inquiry was introduced in the Senate by Mr. Hansbrough, who asserted that all competition in the sale

of agricultural machines and implements had ceased; that the quality of the implements had depreciated, and that the price had risen.——Congress has authorized the Secretary of Commerce and Labor to investigate and report upon the industrial, social, moral, educational and physical condition of women workers and child workers in this country.

To the right are the arches of Lyons, Ltd., McCarthy's Toy Store and the gables of Crosswell's Wholesale Drug Store and Meilke's Jewelry House. To the left are the ruins of the West India Electric Company Railway Station, Chas. Fisher's Furnishing House and Middleton's Iron Mongery.

Chairman Shonts Resigns

Theodore P. Shonts, chairman of the Panama Canal Commission, resigned on the 22d. His resignation was accepted on the same day by the President, with the understanding that it should take effect on March 4th. On the 23d he was made president of the New York Interborough-Metropolitan Company, August Belmont retiring from that office to become chairman of the Board of Directors. At the same time John B. McDonald, who built the New York subway, was elected vice-president. He will supervise the construction of new subways. It is reported that Mr. Shonts's salary will be $75,000. His salary as chairman of the Commission has been $30,000, and he has received nearly as much as this as president of the Toledo, St. Louis & Western Railroad. In the letter accepting "with extreme reluctance" Mr. Shonts's resignation, the President said:

"I do so merely because I do not feel justified in preventing your acceptance of the position you have been asked to take in New York —a position of such great consequence not merely to the people with whom you will be associated in the business management of the enterprise, but to all the citizens of New York. You have shown throughout your association with the Isthmian Canal Commission such energy, administrative capacity, fertility of resource and judgment in handling men, together with such entire devotion to your work, that I

hardly know whether most to regret the fact that the National Government is to lose you, or most to congratulate those who are to profit by your services in your new position. With all good wishes for your future, and with the heartiest thanks on behalf of the Government for what you have done in the last eighteen months in the vitally responsible position you have held, believe me, ever sincerely yours."

This resignation recalled to many the retirement of Chief Engineer Wallace in June, 1905, when he was so severely criticised by Secretary Taft, who held that "for mere lucre" he had left a place in which he had been "bound by every principle of honor and duty" to remain. In reply to questions Mr. Taft says that this is a case of a different kind, because "Mr. Shonts has been engaged in preliminary work which is now nearly completed." In response to similar questions Mr. Shonts says that the work of organization is finished, and that he obtained Mr. Roosevelt's consent. The directors of the company over which Mr. Shonts is to preside also say (in a published statement) that the President was consulted and that his consent to the release of Mr. Shonts was secured. Dispatches from Washington say that this consent was obtained by President Paul Morton, of the Equitable Life Assurance Society, who came from the Cabinet to his present office at the invitation of Thomas F. Ryan. The latter is influential in the Interborough-Metropolitan Company, and the election of Mr. Shonts is regarded by some as an indication that his influence in it is now greater than Mr. Belmont's. The company controls the elevated, surface and underground street railways of New York, and probably will be the successful bidder for the new subways. Mr. Shonts says he finds the problems of transportation in the city not only interesting but fascinating. His obligations to the Government were fully met, he thinks, when the canal work was brought up to the point of letting contracts. Chief Engineer Stevens will probably be placed at the head of the Commission. ——The bid of Oliver & Bangs has been rejected, owing to the unsatisfactory record of Mr. Bangs upon other work for the Government and in relation to the work of Gaynor & Green at Savannah. The next bid is 12½ per cent., but it is said that the Government will not pay more than 9 per cent. Mr. Oliver says that he desired to bid for himself alone; that the Government insisted that he should have a partner, and that, in answer to his inquiries, he was told by the War Department that Bangs's record was satisfactory. He may yet obtain the contract, if he procures two acceptable partners in place of Mr. Bangs.

Mr. Tillman Apologizes to the Senate

Controversy in the Senate over the dismissal of the negro soldiers ended on the 22d with the adoption, without dissent, of the compromise resolution offered by Mr. Foraker, in which the Senate, "without questioning the legality or justice of any act of the President in relation thereto," directs that an investigation of "the affray at Brownsville" be made by the Committee on Military Affairs. The long debate closed, on the 21st, with a very remarkable and highly objectionable speech by Mr. Tillman, who was promptly subjected to discipline in a secret session. After the doors were opened, he apologized. His speech was in reply to what Mr. Spooner and others had said about his attitude toward the race question. Reading from manuscript, he likened his critics, one after another, to members of a minstrel troup, caricaturing them and dwelling upon their peculiarities and failings. The general remark was that nothing like this had ever before been heard in the Senate Chamber. Mr. Spooner responded with dignity, and then Mr. Carmack (whom Mr. Tillman had attacked with much bitterness) took the floor. It was seen that his reply might lead to a breach of the peace. He was not surprised, he said, that Mr. Tillman had alluded to his defeat for re-election, because the allusion was "so easily within the reach of the most grovelling controversial faculty." Mr. Tillman, he added, "did not need to lift his belly from the dust to attain to the height of that great retort." To prevent violence, and also to discipline Mr. Tillman, a secret session was hastily ordered, upon Mr. Teller's motion. In that session the Senators, one after another, in plain language, gave to Mr. Tillman their opinion as to his conduct. After two hours of

this, the Senator from South Carolina consented to keep his speech out of the *Record,* and to apologize. When the doors were opened, he said

"My first essay in the field of humor and wit has been so unfortunate, and my colleagues generally here, as they have told me, have regarded my language as so offensive, that I am sorry that I ever undertook to be funny; and I will promise never to do it again. I think I know how to be bitter. Probably I should have continued to say bitter and satirical things. I did not intend to hurt anybody's feelings. When I want to hurt a man's feelings I generally know how to do it, and nobody can make me take it back, but as I didn't mean to hurt anybody's feelings I will take the language out of the *Record,* and I apologize now to all who feel aggrieved. The only thing an honest man can do when he finds he has unintentionally wounded the feelings of his friends is to apologize, and then if they won't accept it they can lump it."

——Having been passed in the House, the bill forbidding national banks to contribute to campaign funds, and any corporation to contribute to funds for the election of candidates for Federal offices, is now a law. In the House debate it was suggested by Democrats that the bill should require an accounting from the national committees of 1904, and it was said that the money received from the great life insurance companies ought to be paid back. Mr. Williams remarked that undoubtedly restitution would be made if Mr. Roosevelt should insist upon it.——Senator Alger, of Michigan, died suddenly in Washington, on the 24th, of heart disease. Immediately thereafter there was published by Henry C. Campbell, of Milwaukee, a long statement given to him by the Senator in 1900 (with the understanding that it should be given to the world after the Senator's death) concerning the events which led to the Senator's withdrawal from the Cabinet, and the conduct of President McKinley and Senator McMillan, concerning neither of whom the statement is of a complimentary character.

Mr. Roosevelt's Views

The President has sent to Congress a message in support of the pending mail subsidy bill, which provides for an annual expenditure of $3,750,000 in mail pay to steamships on seven routes. Two of these are from a North Atlantic port to South America, and one is from New Orleans to Colon. On three of the four routes across the Pacific, the pay would be taken by existing steamship lines.——In another message, transmitting a report from Insurance Commissioner Drake, of the District of Columbia, he says:

"I agree with the recommendation of Mr. Drake, that what is needed is an insurance law for the District of Columbia on the lines of the so-called Ames bill, already introduced in the House of Representatives, revising it so as to include in it all the desirable features of the so-called uniform bill. With proper modifications, after expert revision, this bill could be enacted into a law so comprehensive and just that it would stand as a model of equity. I regret greatly that there is not national power to deal with this subject; but inasmuch as this seems at present to be the case, we should at least establish a model law in the District of Columbia.

"I believe that the Department of Insurance of the District of Columbia should be made a bureau in the Department of Commerce and Labor."

On the 25th inst., in a letter to Secretary Hitchcock, the President gave orders "that hereafter, to prevent the fraud now practiced in the acquisition of public lands of the United States, no final certificate, patent or other evidence of title shall be issued under the public land laws until an actual examination has been made on the ground by an authorized officer of the Government." Certain classes of claims, including those as to which other action equivalent to such examination has been taken, are excepted.——With the approval of the President, Senator La Follette has introduced a bill designed to revolutionize the public land laws in their application to Government land containing coal, oil, natural gas or asphalt. It provides that such lands shall never be alienated from the Government, and that the mineral or other deposits in them may be taken out upon payment of royalties by holders of licenses issued for terms not exceeding thirty years.——The President has sent word to the delegates who are framing a Constitution for Oklahoma that if they insert a proposed clause designed to prevent railroad companies from protecting their property by special police during labor controversies he will exert his influence to have the Constitution rejected. It is asserted that similar warnings from

him have induced the Democrats, who control the convention, to lay aside projects for providing in the Constitution for the disfranchisement of negroes and a separation of races on railway passenger trains.

Municipal Ownership in England

The present campaign for the elections to the London County Council, March 2d, is being fought on the question of the extension of the power and functions of the municipality. The Independent Labor party has put forward a more radical program than has been before advocated. It is proposed to make the London County Council the central authority for the whole city by absorbing the functions of the Asylum Board, the Water Board, the Thames Conservancy and the Borough Councils, in order to introduce unity of administration and uniformity of taxation over London and its suburbs. The membership of the Council is to be increased to two hundred and women to be made eligible for the office. This new County Council is expected to secure for the community "the unearned increment which now goes chiefly to ground landlords and property owners." It will buy up suburban property and establish garden cities for all classes. The meat and milk business will be a municipal monopoly, because the supply of these foods should not be "left to haphazard and unsanitary enterprises." The waterworks will be municipalized, and also the coal traffic, "because heat is as great a common necessity as water." Lighting and electricity as well as all means of communication by subways, surface lines and motor omnibuses will be managed by the municipality. The Progressive program has aroused very strong opposition. The Moderate party, which last November gained many seats in the Borough Councils, is now making a strong fight against the extension of municipal enterprises. The *Standard* has been publishing a series of articles bringing charges against the London County Council for extravagance and financial mismanagement. The accusations were so specific and virulent that the London County Council was forced to take action and twelve councillors brought libel suit against the *Standard*. The case was set for March, but Mr. John Burns, president of the Local Government Board, in speaking for the Progressives in the campaign, attacked the *Standard* bitterly and said that the *Standard* should have taken the evidence to the Local Government Board instead of to a court where the decision would be postponed until after election. Application was brought by the *Standard* to commit John Burns of contempt of court, but Justice Darling, before whom the case was argued, held that this action was not justified, altho he severely rebuked Mr. Burns for conduct unbecoming a minister of the Crown, in attacking the courts and prejudging a case which might come under his jurisdiction.

——At the conference of the Labor party of the United Kingdom at Belfast, an attempt was made by the Socialist members to commit the party to socialism by inserting in the constitution the following clause:

> "This annual conference hereby declares that its ultimate object shall be the obtaining for the workers the full results of their labors by the overthrow of the present competitive system of capitalism, and the institution of public ownership and control of all means of life."

This was opposed strongly by James Keir-Hardie, the leader of the party in the House of Commons, and was defeated by votes representing 835,000 constituents against 98,000. In place of this a resolution was passed declaring that the lack of employment of working people was due to the private ownership of land and cattle and asserting the necessity of immediately empowering the local authorities to acquire land and to engage in any trade and industry deemed desirable. A resolution was also passed by a representative vote of 605,000 to 268,000 in favor of the extension of the franchise to all adult men and women. The proposal to grant to women the right of election as well as the right to vote was voted down. The Labor party further declared itself in favor of substituting arbitration for war as a preliminary to universal disarmament and in support of a national education policy, which should include the maintenance of pupils by the State, scientific, physical education and the intellectual and technical education of

teachers, education to be under full popular control.

The German Elections

The result of the elections for the Reichstag has been to greatly strengthen the Government, not so much by a direct increase of the Governmental majority as by the cutting down of the representation of the Socialists, who are regarded by the Kaiser as his greatest enemies. It does not appear that their vote was lessened; on the contrary, it is expected that the returns will show an increase of 10 or 15 per cent. in the popular vote of that party. But some 3,000,000 electors who did not vote in 1903 were brought to the polls by the appeal made by the Chancellor to their patriotism. The Center or Catholic party, whose attack upon the Government on the colonial question had forced the dissolution, has not been weakened. The exact composition of the next Reichstag cannot now be told, because German law requires a majority vote; a second ballot being taken for the leading candidates in case an absolute majority over all is not obtained by one of them in the first election. Out of the 397 districts 237 candidates have been elected. These are distributed among the various parties as follows: 41 Conservatives, 10 Imperialists, 18 Poles, 89 Centerists, 20 National Liberals, 6 Radical People's party, 1 Radical Union party, 29 Socialists, 1 Middle Classes Association, 1 Dane, 10 Independent Alsatian Centerists, 3 Reform party, 2 Landowners' Union, 4 Economic Union and 2 German People's party. Second ballots are necessary in the case of 29 Conservatives, 19 Imperialists, 5 Poles, 31 Centerists, 58 National Liberals, 27 Radical People's party, 12 Radical Union, 92 Socialists, 2 Middle Classes Association, 3 Independent Liberals, 4 Guelphs, 4 Independents, 3 Anti-Semites, 8 Landowners' Union, 12 Economic Union and 11 German People's party. In most cases the result of the second election may be foretold with considerable certainty. It is expected that the Social Democrats will have less than 50 seats in the new Reichstag as compared with their 79 in the one just dissolved. If the distribution of representatives was in proportion to the population the Social Democrats would have a representation as great as any two of the other parties. Thus in the election of 1903 the Center party had 100 seats from 1,875,200 votes; the Social Democrats 79 seats from 3,010,800, and the National Liberals 51 from 1,318,600. The districting of the German Empire remains the same as at its foundation in 1871, and the large manufacturing cities in which the Socialists predominate have only a fraction of their fair representation. Berlin has only six representatives, of which five are Socialists. Chancellor von Bülow received a great popular ovation when the results of the election were known. Still his position is not secure and it is doubtful whether with his age and infirmities he will be able to continue successfully in his difficult policy. The Center is still unbroken, and he will be obliged to make some concessions to the Liberals and Radicals to whom he has appealed for support. On the whole, however, the Emperor is doubtless justified in feeling that his policy of colonial expansion and naval supremacy has received a popular endorsement. The effect in France and England will be to discourage the disarmament movements, because it will be felt necessary to be prepared to meet the growing strength of Germany.

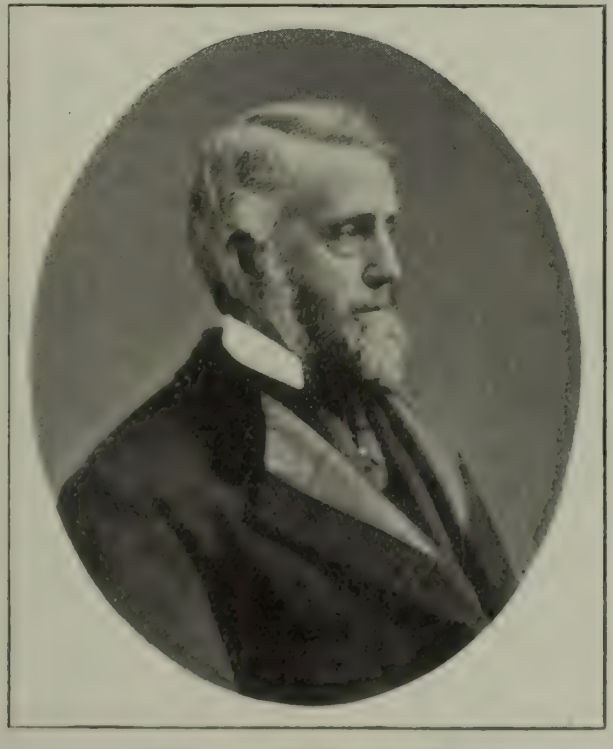
The Conservative Ministry in Spain

The Spanish still continue in an unsettled state. No cabinet has for over a year been able to secure a majority in the Cortes. The difficulty has not been so much a divergence of policy as personal antagonism and mutual jealousy among the three Liberal leaders—Moret, Montero Rios and Canalejas. Five Liberal cabinets have been formed in rapid succession, but have failed to secure the support of more than one of the factions. As a result of these party dissensions, the Liberals are now out of power and a Conservative cabinet has been formed, with Señor Maura at the head. Señor Maura was Premier of the last Conservative Ministry, resigning December 14, 1904. When the Cortes assembled on January 21st it was perceived that the attempt to maintain a compromise Liberal

Cabinet under the Marquis de la Vega de Armijo was a failure, and the aged Premier resigned on the 25th. The Cortes has been suspended by King Alfonso, and it is expected that new elections will be necessary before a stable government can be formed. The Clericals are greatly rejoiced by their return to power, and believe that the Association Law, bringing the friars under the control of the Government, will be dropped.

The Japanese in Korea

Reports are conflicting in regard to the Japanese administration of Korea. According to the Japanese papers, economy has replaced extravagance and the notorious corruption and incompetency of the native officials have been abolished. On the other hand, the dissatisfaction of the Koreans is proved by the numerous riots, and the American missionaries tell sad tales of the moral and financial injury done to the natives by this "carpet-bag" government. According to them, the Japanese are responsible for introducing lotteries and protecting the opium traffic. Formerly a foreign woman could travel alone in an open chair from one end of Korea to the other without fear of insult. Now it is dangerous for a lady to venture twenty miles from the capital into the interior. Not only are the Japanese soldiers quartered on the inhabitants, but also their prostitutes. In a number of instances Korean Christians have been compelled to leave their homes because these women were thus forced upon them. Nearly a hundred thousand Japanese have come into Korea since the war, and in many cases they have been permitted or assisted to seize lands in a high-handed fashion. Colonization is being carried on systematically and continuously, for the purpose of insuring Japanese supremacy. People from the same village in Japan locate in the same place in Korea. Rice land, pastures, fisheries, salt works and the seaweed industry have been taken by the Japanese. The immediate cause of the war was the attempt of Russia to get control of the valuable timber lands on the upper Yalu River. These are now being denuded of the forests by the Japanese. Rich farm lands in tracts of two hundred square miles have been seized for "Imperial pastures," and in the towns and their vicinity land and buildings have been appropriated for military purposes without adequate compensation. The Japanese are said to take land on spurious forged deeds and to throw upon the Korean owner the obligation of proving his claim before a Japanese official or a Korean who is overawed by the Japanese. The Japanese administration of the finances of Korea is also criticised. On the "advice" of the Resident-General, Marquis Ito, Korea borrowed $5,000,000 at 6 per cent., issued at 90. This is supposed to be spent on internal improvements, but it is claimed that most of it has gone into Japanese hands in one way or another. The reform of the debased currency, for which Japan has received much credit, has worked hardship upon the natives, and has caused many riots, for the Koreans are compelled to pay taxes and other obligations in the new nickels, which are worth two or three times as much as the old. Since Korea is already densely populated, supporting 10,000,000 on an area less than that of Kansas, the continuous immigration of Japanese tends to crowd out the Koreans, but the Koreans are not allowed to leave the country even to travel abroad without a passport, and recently the right to issue passports has been taken from the Korean Government and assumed by the Residency-General. Mr. Tsuruhara, acting as chief of the civil administration of the Residency-General in the absence of Marquis Ito, charges the Christian preachers with extorting money from Korean converts under various fraudulent pretexts, such as the building of churches and charitable objects, and has ordered his subordinates to protect the people against these exploitations. This suggests retaliation against the missionaries for their outspoken defense of the rights of the Koreans against the invading Japanese. There are nearly 200 Korean students in the universities of Japan. The withdrawal of national aid has left them destitute, and twenty-one of them sent a petition for help to the Government at Seoul enclosing a finger cut off from the hand of each student. Japanese teachers have been placed at the head of all the schools in Korea.

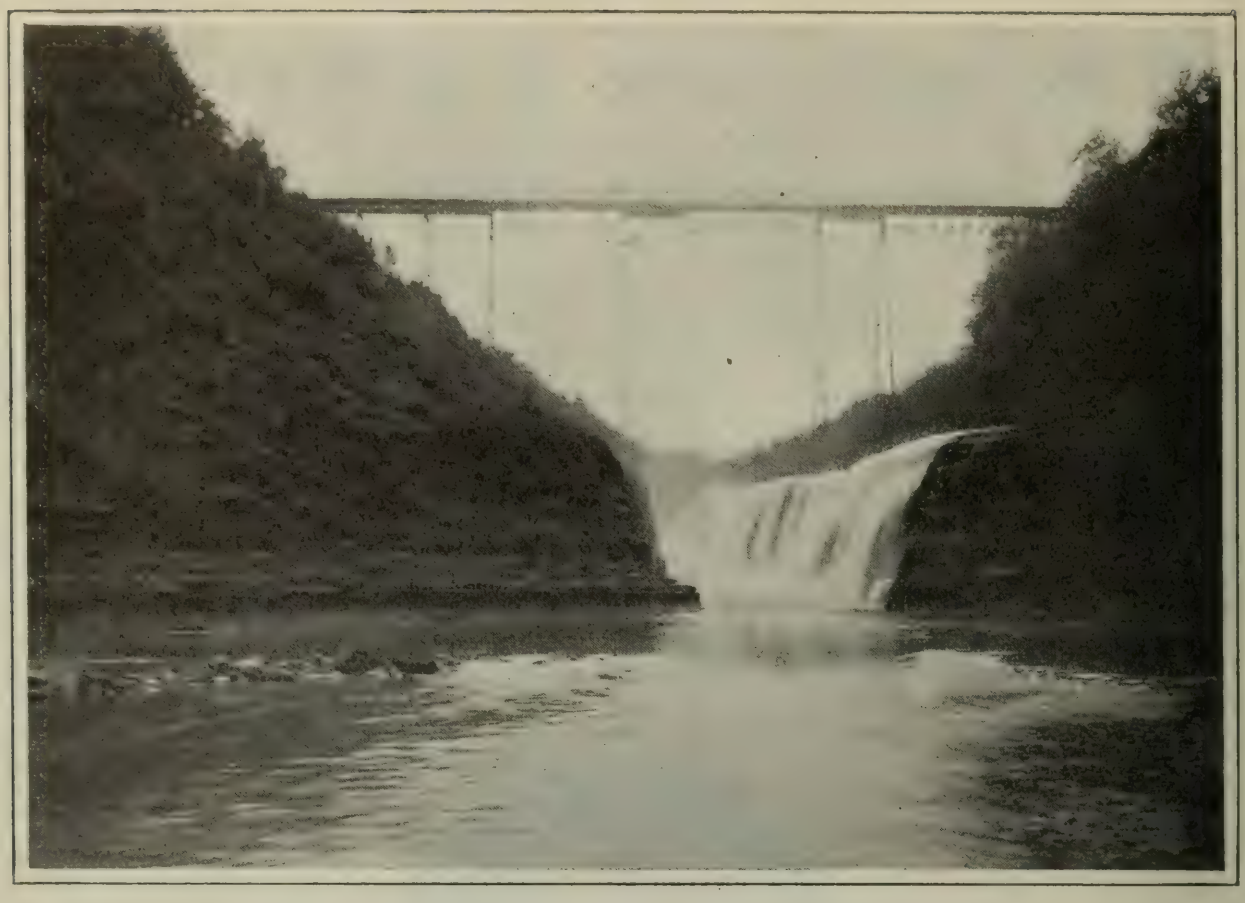


Letchworth Park: A Gift to New York State

BY ISABEL C. BARROWS

Author of "The Shaybacks in Camp," Etc.

BY a rough road that winds over the Canadian hills is a resting spot, a tiny triangle, of grass and wild shrubs, known as "Letchworth Green." If that modest gift gives pleasure to the wanderer, what will be the joy of the great multitude in that beautiful tract of a thousand acres which a grateful State will surely call "Letchworth Park"?



For more than half a century Mr. William P. Letchworth has lived upon the land which he has just given to New York, beautifying it by every means that admirable taste and skill could suggest, till today it is one of the most attractive spots in the whole State; not so grand as the Adirondacks; not so majestic as Niagara; not so unique, perhaps, as the Ausable Chasm, but combining the charms of each of these places and adding many of its own.

WM. P. LETCHWORTH.

The park extends for about three miles on both sides of the Genesee River, the most wild and picturesque bit of that interesting stream, for it includes the three superb falls, which in their combined leaps spring nearly three hundred and fifty feet. The glen, or rather the cañon, is wild and picturesque, in places with perpendicular walls of beautiful coloring, fringed at the top with trees, bushes and vines which look as tho Nature had done her best to beautify and soften the solemnity and ruggedness of the scene—as she has, aided, however, largely by the Master Workman who planted them exactly where they ought to grow. It is worth a long journey in the fall to see the red streamers of the American woodbine flaunting themselves against the gray rocks, hundreds of feet directly above the rushing waters.

On one side of the river safe flights of stairs have been constructed by which one may descend to the edge of the stream and watch the falls and rapids,

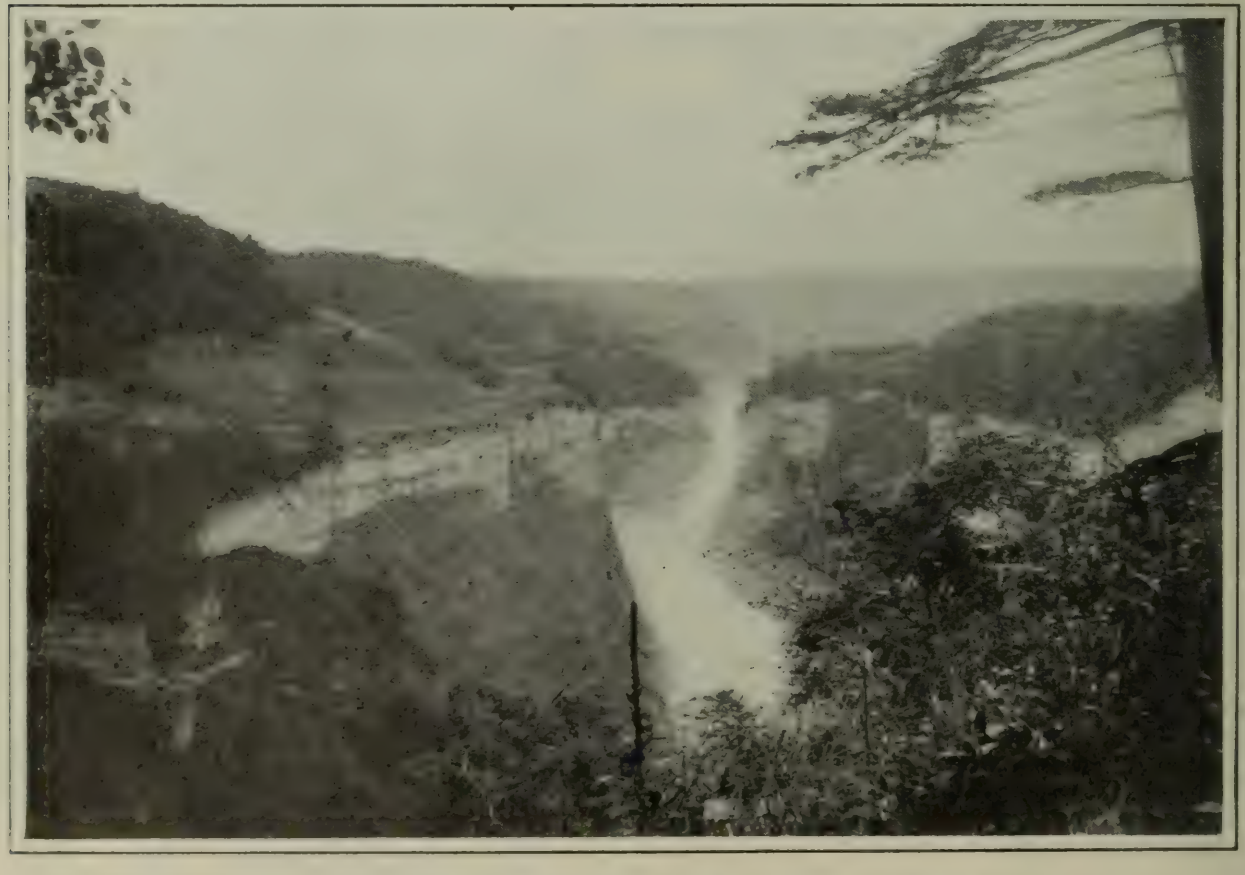
UPPER FALLS AND PORTAGE BRIDGE AT GLEN IRIS.

LOWER FALLS OF THE GENESEE AT GLEN IRIS.

From southern end of Table Rock looking south. Here the stream pushes thru a narrow, deep defile before emerging into the canyon.

the cascades and whirlpools, as they thunder and dance and flash, and turn and twist in the narrow channel. Only those who have been happy enough to see for themselves the wonderful beauty and grandeur of the Glen Iris cañon can realize what it is going to mean for the people to have this park made free to them in the future, as it has been for the past fifty years.

SUGAR LOAF ROCK BELOW LOWER FALL.



A curious product of stream erosion, figured by Professor James Hall in his geological report of 1843.

Those who have known Mr. Letchworth only as an expert business man managing prudently and wisely his own affairs; or, as the head of the State Board of Charities, an institution which he served with self-sacrifice and zeal for a quarter of a century, interesting himself in jails and poorhouses and insane asylums, rooting out abuses and fighting, as a Quaker must fight, with the uncarnal weapons of patience and wisdom—those who have seen him only thus have not seen the whole man. They should see him in the forest by the riverside when families of neighboring farmers come for a day's outing, the farm

wagon heaped with goodies for luncheon, the horses unharnessed and tied to the long bar between the trees. All know and reverence him. Every hat comes off as he walks, like the father of the land, among the people, chatting with the wives and daughters, patting the little ones on the head, exchanging a few words with the men about the crops —gentle, kindly, benevolent, a blessing in his very smile. Or they should have seen him in the summers when one of his cottages was filled with convalescent children from the hospitals in near-by cities and from crowded tenement houses, coming as his guests to recover life and strength. Here he went about doing good, like the Galilean Master who walked about the fields of Palestine.

It is nature and the people whom Mr. Letchworth loves best, not money making nor committee ruling. To give to the people a chance to learn to love nature as he loved it, to draw from life among the trees such boons as he had won, his generous heart long ago devised making this a people's park for all time. So every path has been always open to friends and neighbors, to the people of the neighboring city and of all cities, and by the thousand they have taken advantage of his kindness while he lived, and he has seen how much they needed and appreciated such a boon. And now it is theirs forever. Small wonder that in other parts of the State, and in other States, they are saying: "Would that a Mr. Letchworth would give *us* a park of a thousand acres!" And others would, could they see his joy, for he has felt to the full the realization that it is more blessed to give than to receive.

The home of Mr. Letchworth is a reflection of his own character. It is simple, but filled to overflowing with books and pictures and the mementoes of those who love him. It stands in a sunny lawn, with broad, inviting piazzas; shade trees here and there and close by a gigantic outdoor birdcage where Mongolian pheasants are reared, a never-tiring attraction to the visitors who throng the place in summer. Undaunted by the fact that selfish hunters occasion-

ally shoot them, these birds are given their freedom as soon as they can care for themselves, and it is a pretty sight unexpectedly to catch the vision of a brilliant pheasant darting across your path while wandering thru the woods.

The woods are so open that they are full of lovely flowers from spring to fall, beginning with the earliest anemones and blood-roots, houstonias, columbines, violets, trinity flower, with its marvelous white bloom, mandrake, with its waxy blossom, and a thousand others; on thru the azalea and laurel season till the golden rods have faded and the last autumn-blossoms are swept away with the dying leaves. These have been guarded in such a way that they increase and multiply and conserve beauty for the days to come.

For rainy weather there is a fine museum, on the hill where the Indian council house stands, a building from olden days transported here for preservation, along with relics of Indians to the number of thousands. Here, too, is a characteristic thing. One day Mr Letchworth found workmen in another town building a culvert of gray stones that had marked the spot where Indians had been buried. He secured from the town permission to take possession of them, paying for common stone to replace them in the culvert. How many busy people would have concerned themselves to pay honor to the dust of a red man? But he religiously moved the stones to a spot near the monument to a white Indian captive which stands by the old log council house, where they are mute witnesses to the gentleness and spirit of reverence which have marked this man thru life.

Letchworth Park! It is not yet wholly ours—the people's—because he lives there still, among his beloved trees, an old man, filling every moment with care and thought for others, a way he has had of doing for threescore years and ten. Long may he be there in body, as he will always be in spirit, for every day of the presence of such a man adds a benediction to his gift!

The Japan of 1906

BY THE REV. J. H. DE FOREST

MISSIONARY OF THE AMERICAN BOARD AT SENDAI, JAPAN.

AS the year opened the attention of the world was drawn to the famine in the three northern provinces. The fact is, it attracted too much attention. International sympathy should be prompt and generous and finished practically at one stroke. But our aid was stretched over a period of five months, until finally, the help that was at first so gratefully received, hardly produced a polite bow from the governors, who were properly tired of being held up before the world so long as objects of charity.

The Japanese know exactly how to give and when and in what amounts. They have the art of giving scientifically as no other nation has. Take the San Francisco earthquake. At once a fund was made up, beginning with His Majesty's generous gift and including contributions even from the famine region. One big sum of hundreds of thousands of yen was sent in a lump to the ruined city. President Roosevelt's announcement that no gifts from abroad would be received probably prevented this money from going thru the Washington channels, but it arrived all the same where it was needed.

This material interchange of sympathy is the first that has taken place between the East and the West, and it is a great pity that the unfeeling action of the San Franciscans has so muddied this powerful stream of international good will. Whatever rights a State may have to educate those within its own limits as it pleases, it has no right to wound recklessly the feelings of a friendly nation by such sweeping action as that taken under the constitution of California. The great East and the great West are coming in close contact with each other, differing in civilization, religion, morals, customs and language. The solution of the most delicate and difficult and far-reaching problems of the twentieth century depends on the way the West meets the East. The startling ruin of San Francisco by earthquake and fire is a mere bagatelle beside the possible ruin that will follow a rising race hatred between the yellows and the whites. "Undoubtedly white is the better color," said Count Okuma. But it is better only as its owners have a better heart in which abides a spirit of universal righteousness. Whatever may be the legal outcome of this school question, the people of Japan have the highest regard for the attitude taken and the sympathy shown by our President, and they do not forget that American universities and higher schools have always been open to the youth of Japan.

The Korean problem is somewhat like that in California. It is notorious that some of the worst elements of Japanese society have for years made the name of Japan stink to Korean sense. No worse treatment has been experienced by Japanese from rowdies in California than has been felt by Koreans from Japanese rowdies. To remedy this glaring evil, as well as to put Korea in political order so that she will not be a constant peril to the peace of the East, Japan has sent her ablest statesman, Marquis Ito, to Seoul. No plainer declaration of a righteous purpose could be made than this gift to Korea of this far sighted, justice-loving statesman, who has selected his aids from among the ablest and most experienced and upright of the official and educated classes.

In the same way it is well known that there is a disorderly element among the Japanese in California. Respectable Japanese have told me that when they saw the condition of some of their countrymen over there, they were ashamed to be known as belonging to the same nation. I have been told also that the Japanese consuls on the Pacific Coast are not equal to the situation. "All the

troubles between Japan and the United States have their origin virtually in San Francisco, and therefore the consul there should be a statesman. An Ito or an Aoki ought to be sent to have charge of Japanese affairs in California, and then this school trouble would have been anticipated and never have assumed such dimensions." To that we must say that if Californian officials were of the Roosevelt-Root type, there would have been no such blundering legislation as has disturbed the warm friendship of these two progressive nations.

It is useless to rely on the "most favored nation" clause to prevent race hatred. There must be a wide and prolonged education in international righteousness, and the keeping of experienced statesmen of both sides at the front, and the cultivation in every possible way of worldwide sympathies, if the East and the West are to live in peace.

The advanced position Japan has won is recognized in the change from legations to embassies, and this has resulted in almost a complete change of personnel in the American Embassy. Our gifted and cultured Minister Griscom was sent to Brazil as ambassador. Mr. Luke E. Wright was promoted from service in the Philippines to be our first ambassador here. Instead of wire-pulling for the place, the office sought him. Mr. and Mrs. Wright are each "Your Excellency" in diplomatic life, but when you meet them they are simply cordial Americans who greet you like old friends. I have heard that he is the ablest legal mind the United States has ever sent to Japan.

Our First Secretary, Mr. Huntington Wilson, has been called to Washington as Third Assistant Secretary of State, where his knowledge of the East will be of value in unifying and perfecting all branches of consular service. The one stand-by is Mr. R. S. Miller, Japanese interpreter, who many years ago came out as Y. M. C. A. secretary, and later accepted the position of interpreter to the legation. The success of Y. M. C. A. work in Manchuria, and its recognition by an imperial gift of 10,000 yen, was due largely to his deep interest in that work. Washington has sent out for Mr. Miller's department six student interpreters to prepare for diplomatic service in the East—a movement that should have been made years ago.

Japan and the United States united two years ago over a monument in memory of Commodore Perry. It is planned some time to erect a bronze statue of Ii Naosuke, the premier who dared to sign the first treaty with the Commodore. For this act, which technically was in violation of imperial commands, he was assassinated by lawless haters of foreign barbarians. I happened to be speaking last month in Hikone, the castle town of Ii Naosuke, and was invited to attend the celebration of his birthday in the castle—the first time any foreigner had been present. I received on that occasion a precious memorial, a stanza composed by this man before he became great, and signed Naosuke. There are very few of these in existence. This one shows his deep love of nature that made him forget all about catching the gold fish that had gathered in his basket trap.

*"Untouched the fisher's basket lies
Below the babbling river's brim,
While he beholds with wondering eyes
The scarlet maple leaves that swim
On fins of fire across its rim."

A wooden statue of this martyr has long stood in the Washington Museum, and when the right time comes, I am sure that Americans will gladly join with Japan in a suitable monument to the memory of the man who knew he would be assassinated if he signed the treaty, and whose daring decision saved Japan from war and made possible the fifty years of warm friendship between Japan and America.

Of the year's literature one book has reached a world-wide mark, having already been translated into English and Russian, while proposals to put it into French and German are offered the author. Lieutenant Sakurai was in General Nogi's army at the siege of Port Arthur. In the prolonged unsuccessful attack of August, he was wounded nine times and ought to have died. But his brave men dragged him out of the bloody charge, and what was left of him gradually recovered. With various wooden and cork appendages he lives and moves and is very much in evidence. Last April he published his campaign in

* Translated by Miss C. B. DeForest, Kobe

a volume of 254 pages. General Nogi endorsed it, and it was shown to the Emperor. Then followed a wholly new departure in the Imperial Court. For the first time a man of lieutenant grade in the army was called to the palace for an audience with his Emperor in his own private room, where, dressed as commander in chief of the army, he received the lieutenant, leaning upon the arm of General Okazaka. As one result of that extraordinary favor the book went thru seven editions in July, ten in August and last month was in the thirty-third edition of one thousand copies each.

"Niku-Dan!" "Body Bullets" is the strange name of this book, which thrills the Japanese with the suggestion: "We living bullets hurled ourselves against the Russian fortress." I never read such a sustained record of unspeakable joy in the midst of such horrors. Such absolute loyalty night and day! Such exalted glorying in the service of the adorable Mikado! Such pure delight in suffering and dying for His Majesty!

I must refer to one incident in the book, that of drinking water together as the sacramental sign of no more meetings on earth. This is the proper thing to do in Japan when friends part in peril with no expectation of meeting again. I know one Christian who, twenty-five years ago, performed this rite with his friends, expecting early assassination. The plot miscarried, and a Japanese resembling him was killed instead. Teetotalers coming to Japan should be careful not to drink the health of Japanese friends with water. I heard that Mr. Bryant did this at a dinner with Admiral Togo, saying: "As you conquered on water, let me drink your health in this cup of water." Admiral Togo was willing enough, for no superstition clings to him, but his friends, standing with him in this toast, shrank and had a shadow of the sacrament of death, and so they hurriedly put a glass of something else in the admiral's hand, and thus averted all danger from their beloved hero.

To turn from "Niku-Dan" and read the account of the voyage of the Baltic Fleet by one of Admiral Rojestvensky's staff officers, is to drop from ecstatic joy and glad sacrifice and absolute loyalty and certainty of victory to doubts, discouragement, complaints and overwhelming defeat. Russia had some splendid men in her army, but her system could never produce an army of men like the author of "Niku-Dan."

The grand review of the victorious troops and the amazing exhibit of war trophies took place in May. It will task the mind of any who missed the sight to imagine the vast array of guns of all sizes and caliber, of transportation wagons, of sabres, of rifles and bayonets and lances that were exposed on the broad plateau in front of the palace. Huge arches were made of captured bayonets; the roads were lined with fences made of sabres and Russian rifles. Within and without the fences were unbroken rows of siege guns, long guns from the ruined warships, field guns of various kinds, the deadly machine guns, and huge piles of gun-shells. Entrenching tools of all sorts were hardly noticeable besides the other trophies. Arches and pyramids of similar war materials were erected before the Yasukuni Shrine, where the Emperor and Crown Prince, representing the people, do homage to those who fell in the war. It is almost a pity that the new Russian Minister happened to arrive at this time when, in order to present his credentials and be received in audience by the Emperor, he had to drive thru the center of these evidences of his country's defeat. It will aid the imagination to know that "511 pieces of artillery, 70,000 rifles, 2,162 wagons, 11,612 large shells," were only a portion of the display.

Postbellum financial problems are generally hard to handle with success, and often involve severe crashes. But the Government keeps a scientific hand on all great financial ventures, so that there is not only no disturbance of the money market, but there is an unprecedented advance in business enterprises, subscriptions to which now amount to 833,000,000 yen. For the empire to have carried thru the war with Russia at an expense of 2,000,000,000 yen, to have subsequently subscribed a sum equal to nearly half that amount for new enterprises, to have nationalized seventeen railroads at the purchase price of 421,000,000 yen, to have put in order 720 miles of Manchurian railroad, to have a debt only 1,320,-

000,000 yen larger than before the war, and all with no derangement of financial or economical conditions, is worthy of record and admiration.

It is becoming evident that foreign money flows into the country thru the increasing number of tourists, over 15,000 being reported for the last year, each of whom is estimated to spend a thousand yen here. The unrivalled scenery of these islands and the thousand hot mineral springs that richly reward invalids of all kinds, are among Japan's greatest treasures, tho they are as yet hardly discovered. Japan is surely destined to be one of the best visited lands of the whole world.

SENDAI, JAPAN.

The Independent Minister

BY HERBERT D. WARD

[The writer of this article, while devoted mainly to general literature, is a graduate of a theological seminary, and has been a close observer of movements in religious thought and life.—EDITOR.]

EARLY this fall two clergymen sat in New York discussing the future of a young man. One of these was one of the two leading preachers of Greater New York, the other probably the first pulpit orator of Greater Boston. The question was what to do with the oldest son of the former.

"I shall put him into business or into law," said the father. "I shall have no son of mine undergo what I have suffered."

"You?" in great surprise.

"Yes, I," the venerable and venerated clergyman answered. "I want one member of my family independent and his own master, even if he hasn't a cent in the world. Look at me! You wouldn't believe it," he continued, in a half embarrassed whisper, "I am a slave to my committee and always have been."

The younger man, the brightest thinker of and a national leader in his own denomination, made answer:

"I have just resigned from my church to starve and be free. There is only one remedy."

Far into the night they talked it over in perfect accord.

The conditions under which a pastor works change with kaleidoscopic rapidity. There was a time, not long ago, when he was the intellectual as well as the spiritual leader of his congregation. That time has past except in isolated village communities, unnoticed by trade and progress.

I always like to recall the intellectual as well as spiritual independence of my grandfather, who was easily, as he should have been, the first citizen of the little town of Abington, where he ministered for a quarter of a century. For four generations, in direct line, his fathers had been ministers before him, and he had inherited much of that ecclesiastical aristocracy and spiritual authority which one cannot find nowadays within the courts of the Protestant denominations. He ruled his congregation with power and love. His people stood in awe of his attainments and accepted his verdict without question. He was their oracle in life, health, literature and gardening. He imported the tomato and the peach tree and was an original Abolitionist. He was mobbed by the old and protected by the young. He converted his deacons and his congregation to what in those days would be considered the rankest heresy, and what would now be considered hide bound conservatism. He was an authority on Hebrew, and the most wideawake man in his community on public matters. It was natural that they should send him to the Legislature and the State Senate, where he made an austere and progressive record. As I said, he led his church as a pastor should. His shepherd's crook was never used to beat spiritual pro-

gression into the hard heads of balking deacons, but only to save every lamb from the crevasses of their temptations. And—and this is the peculiar part of the whole matter—he was one of the *poorest* men in his own parish. On eight hundred dollars a year he educated two girls, sent three boys to college and preserved his splendid independence intact.

I hold that this noble record of a noble man is, outside of one or two extraordinary exceptions, impossible under the present social conditions.

That was fifty years ago. Even in my day, when I had passed two years at Union and had graduated at Andover, the position of the pastor was patriarchal compared with the present day, "Twenty Years After."

The madness for money—the ease of speculation—the enormous fungi fortunes—the high wages and higher prices—the worship and fear of wealth—unbounded luxury and unbridled extravagance—all these and many other forms of Mammon hysteria have brought about a revolution in living conditions. Men are no longer measured by spirituality, by intellectual achievements. Many may be respectable, but only the bank account has respect. Nine-tenths of our leading churches are dominated by the insolence of wealth. Nine-tenths of our homes are mentally atrophied by its specter. This is not only the fact in cities, but the miserable conditions have been aped in country towns by the local coterie of the *nouveaux riches*, and are even filtering into the primitive fastnesses of our mountain hamlets.

It is a miserable fact which we must honestly face that the average man as well as the average church is hypnotized out of his independence and manhood by the rich man of his environment. And the poor minister—who entered the clergy with white wings flying, with soul inflated by noble enthusiasms, with heart choked with the beauty of holiness, and with his mind made up to be a modern martyr, if necessary—finds himself, after a few parish changes and with heart choked by the diabolism of ugliness, wondering whether he has any tenets at all he dare call his own, and harassed by cowardly parishioners on the one side and threatened by lordly moneybags on the other.

How many a good man I have seen ground into something less nutritious than powdered dog-biscuit by the upper and nether millstones of assumption and timidity! How many an active clergyman I have heard bewail the conditions and his own impotence!

I have a very good minister friend whom I often run across on Mondays. He is about thirty-eight or forty, is happy, alert, cheerful, hopeful; with a devoted congregation behind him, and, more marvelous than that, a cabinet of deacons that are his advisers, *not* his masters. He has plenty of rich men in his church, but they follow him, wherever he leads, with courteous docility. Moreover, this clergyman is a power in his community—in righteous politics as well as in religion. What is the secret of this patriarchal control? By what means can he leash the power of wealth and curb its madness for management? What gives him his almost unique independence, and imparts that quality to the members of his church, so that each one shares alike with pride in its management and enterprises?

Is it the power of preaching? No! I have heard much more brilliant oratory from an ecclesiastical slave. Is it because of his masterful personality? No. He is a mighty good fellow, and eats with his fork like a gentleman. But so do hundreds of other ministers. Is he an angel in his parish work? Not a bit of it. He is a modern, and doesn't believe in parish calls except under pungent necessity.

"Well, what on earth is the secret of it?" I asked him the other day. He smiled with shrewd kindliness and made answer thus:

"I have only had two churches in the twenty years of my ministry. But on the two occasions when I have been called to a church I have immediately asked my deacons to meet me in conference. I have only told them one thing, namely, that I have an income independent of my church salary, and that I proposed to act and preach as independently as my income; that I would be glad of their advice and co-operation; but as I had been called to lead the church I proposed to do so until we parted by mutual agreement. I can tell you," he

ended with a gleeful smile, "no one ever peeped after that."

So my friend preaches Christ as best he can, with an undisturbed serenity that is as valuable as it is rare.

In other words, the time has come for the minister who wishes to have a successful pastorate to be financially independent of his church salary. Not long ago a brilliant man in Hartford preached a sermon on sane socialism. He, his wife and children starved as a consequence for two years until he captured a small pulpit in Vermont, where he is temporarily respected. If he had had an independent income the rich owner of the church would not have kept him in terror for months and then finally have "fired" him.

I advocate the discouragement of young men entering the ministry who are the poor and third-class refuse of our colleges—men who elect the Church because they have not the intellectual equipment to compete in more strenuous fields of work. This would eliminate fully 50 per cent. of the theologs. I have been thru it, and I know what I am saying. I am placing the estimate low. I would discourage the poor enthusiast for the present. Under the present conditions he cannot develop his independent manliness and live in the pulpit. If he does live, he borders close to the time-server and the hypocrite.

I would encourage the sons of rich men—who otherwise are going to seed—to become born again into a profession that cries aloud for their souls, their blood and their independence. We want more Stokeses and Tiffanys and Johnsons. There is no profession that gives such variety, such drama, such chances for the exciting study of humanity, such opportunity for devotion as the Church. Let us proselyte the scions of the rich and thus make wealth human and redolent with *camaraderie*.

I should encourage the necessity of an independent livelihood as a prerequisite to the becoming clergyman. Dr. Collyer can make a horseshoe as well as any man. The fact that he graduated from the forge to the pulpit gives him an acceleration of power and prestige. The minister should be able to earn, if he hasn't got it, his living, outside of his pulpit. It may be in the lecture field, the making of books or metal work, or in the carving of wood or the reading of proof. In some industry or profession he should be able in the most modern fashion to earn his living at any moment. When he is a producer of wealth, as well as an illustrator of spirituality, he gains the respect of the rich and touches the hearts of the poor as he can in no other way. St. Paul was a maker of tents; Jesus a carpenter. He can then preach as he wills.

I believe that there is little place in the ministry today for one who is not absolutely independent of his church salary. He is then free. He is no man's slave, and his heart beats with power. Is this heresy? If it is, you will find that the time has come when it is as necessary as the abolition of infant damnation.

NEWTON CENTER, MASS.

Wanted—A Samaritan

BY NICHOLAS WORTH, JR.

PRONE in the road he lay,
Wounded and sore bestead:
Priests, Levites past that way,
And turned aside the head.

They were not hardened men
In human service slack:
His need was great: but then,
His face, you see, was black.

MONTROSE, PA.

Music Art and Drama

Richard Strauss's "Salome"

When Maurice Grau was manager of the Metropolitan Opera House he inaugurated the custom of having an annual benefit performance at which all the great singers in his company gave their services free. His method was simple: one year all of his artists, attired in their favorite costumes, sang along in the soldiers' chorus in "Faust"; but generally he produced an operatic hodge-podge consisting of detached acts from several operas, thus giving each singer a chance to be heard in his or her best rôle. When Mr. Conried succeeded Mr. Grau, he simply gave an extra performance of "Parsifal" and pocketed the resulting $22,000. The following two years he gave sumptuous productions of operettas by Johann Strauss — first "The Flittermouse," then "The Gypsy Baron," interpolating opportunities for all the artists not in the cast to sing solos.

It would not have been safe to repeat that experiment too often. But if Johann Strauss was no longer available, was there not another Strauss in the field—a Strauss differing, to be sure, from the Waltz King as an elephant differs from a gazelle? Richard Strauss, who was formerly known to the world chiefly as a writer of brobdingnagian symphonic poems, had, since the Conried benefit of 1906, made a tremendous sensation with his one-act opera "Salome." It had been forbidden by unwise censors in Berlin and Vienna, and, starting with this tremendous advantage, it had soon found its way to nearly thirty opera houses in Germany

and two even in Italy. Obviously nothing better for the Conried benefit of 1907 could be found than this same "Salome," and so it had its first American performance on January 22d, with a cast including Fremstad as Salome, Weed as Herodias, Burrian as Herodes, Van Rooy as Jochanaan, Dippel as Narraboth, Reiss as the First Jew, Mühlmann as the First Soldier. As a matter of course, it was impossible to interpolate any solos in such an opera, hence there was an operatic concert preceding the performance, in which Mmes. Abott, Alten, Boninsegna, Cavalieri, Eames, Farrar, Fleischer-Edel, Homer, Kirkby-Lunn, Rappold, Sembrich, and MM. Burgstaller, Caruso, Goritz, Plançon, Rousselière, Scotti and Stracciari appeared. The opera itself is in one act, and lasts only about an hour and a half.

There is no difficulty in understanding why the censors of Berlin and Vienna were anxious to keep this opera off the stage. The libretto, which is Oscar Wilde's play of the same name, with a few slight changes, is probably the most disagreeable production ever placed on the stage, and that is saying a great deal in these days of pathological literature. At the same time there are poetic and pictorial features in the play which might easily appeal to a composer who is not squeamish. In all probability, however, what prompted Strauss to select such a libretto was the shrewd calculation that the heated discussions likely to follow such an audacious production would benefit him financially. His love of lucre is well known, and as for audacity, that is the chief characteristic of all his music. Not a few of those who have heard his "Salome" feel that he has violated the laws of musical propriety and decency as recklessly as his libretto violates the moral and religious proprieties.

SALOME WITH THE HEAD OF JOHN THE BAPTIST.
From the Strauss Opera.

Salome is not referred to by name in the Scriptures; she is Herodias's daugh-

ter who danced for Herod. After he had promised to grant her anything she might ask for, unto the half of his kingdom, she demands the head of John the Baptist, and Herod, exceeding sorry, yet for his oath's sake, sends an executioner and the head is brought in a charger and given by the girl to her mother. In the Matthew version of the story it is made clear that it was at the mother's instigation that the maiden asks for the head. In Oscar Wilde's play Herodias approves of the demand, which, however, is made by Salome of her own accord in her anger over the prophet's refusal to yield to her wanton blandishments. After enumerating various physical charms of which she is enamored, she exclaims again and again: "I will kiss thy mouth Jochanaan, I will kiss thy mouth"; and, baffled in her desire, she finally sates her lust on the bloody lips of the severed head when it is brought in on the platter.

The pen hesitates to write down such abominations, but it was necessary to give these few details to make the reader understand why even of the admirers of Strauss—and he has many—the vast majority are horrified and wish he had not put their loyalty to such a cruel test. Some of his critical champions in Germany have tried desperately to rescue his reputation by pointing out that after the disgusting scene referred to Salome sings a triumphant song of love, and thus redeems herself. Wrote Dr. Leopold Schmidt:

"Considered from this standpoint poem and music are no longer incongruous, and Strauss no longer appears as the representative of a decadent epoch, but, on the contrary, as one of those who, in the entanglement of our times, point to better and higher goals. Only with such views can one get artistic enjoyment from 'Salome,' otherwise it merely fascinates and stupefies the senses."

But this argument was promptly pricked by another Berlin critic, E. E. Taubert, who, referring to that final song of love, writes:

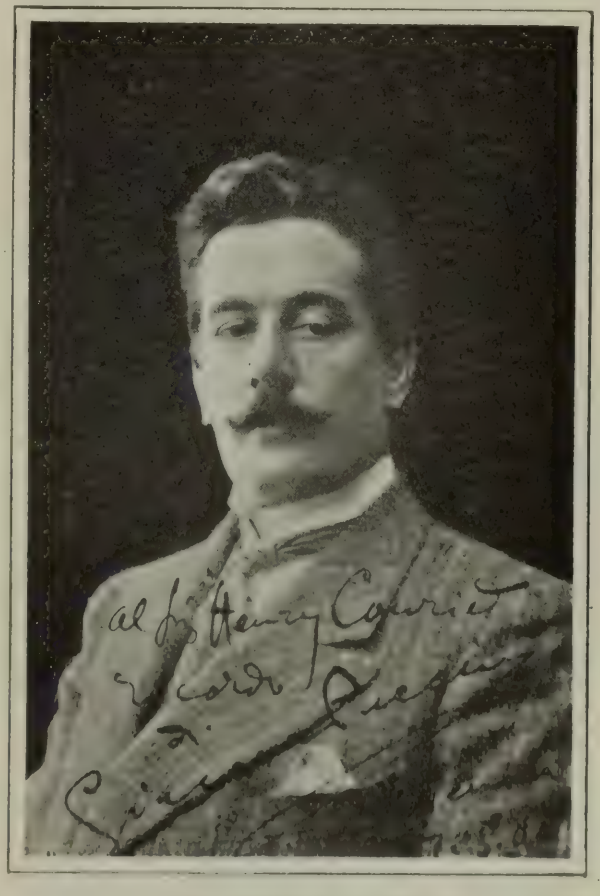
"A positive lie is this mood, which attempts the tone given at the close of 'Tristan and Isolde.' A lie is this, for nothing in the soul of Salome justifies it. Her sadistic lust satisfied, she deceives herself in the sensation of redeeming love. Every hearer capable of healthy sensations and feelings must revolt against this closing song, which sounds well musically, but which is not justified by anything that precedes it."

It is difficult to disagree with Taubert: but that final song of love, insincere and inconsequent though it be when considered with reference to what goes before, is truly glorious, vocally as well as orchestrally. Strauss here builds up one of those huge climaxes which stir the blood; it is this climax that probably will tempt not a few to hear "Salome" a second time, even tho they may disapprove of the opera thoroly, both musically and dramatically.

Musically, it is difficult to see how "Salome" can greatly interest the average audience—the kind of an audience that crowds the opera house when Caruso sings with Sembrich. Mme. Sembrich declared, after hearing this opera abroad, that compared with it, Wagner's latest music dramas are as tuneful as a Rossini opera. Strictly speaking, there are no tunes in the Wagner operas following "Tannhäuser," but there is *melody* everywhere, often in the vocal parts and always in the orchestra; in many cases two or more beautiful melodies are intertwined with a rare polyphonic art that would have made even Bach raise his hat respectfully. Strauss also is a skilful weaver of melodies, to call them so by courtesy, but he impresses us infinitely less than Wagner because these melodies are so insignificant.

To be sure, a master shows his skill by the use he makes of unpromising material; a French cook can make several kinds of palatable soup out of thistle tips; but after all asparagus tips and okra are better, yet for such succulent vegetables one looks in vain in Strauss's garden. He has a morbid appetite for thistles and nettles and cactus; musically speaking, his score bristles with dissonances and cacophonies cultivated for their own sake. They are often clothed in beautiful orchestral colors, but that does not take the sting out of them.

A Strauss champion might retort that since the story is hideous, should not the music be hideous too? Perhaps, but there is a limit. We pardon a florist for selling us roses that have some thorns, but what would we say to a Burbank who exercised his ingenuity in enlarging the thorns and dwarfing the roses? That's Richard Strauss in a nutshell. He will never be a popular opera composer; but



the students will delight in his skilful combinations and calculations.

For the way in which the opera was presented Mr. Conried deserves the highest praise. The cast could hardly have been improved on. Miss Fremstad sang and acted her part fascinatingly. In Mr. Burrian, Mr. Conried was so lucky as to have the creator of the part of Herod at the very first performance in Dresden. It is needless to specify the other parts; they were all ably filled, and Mr. Hertz interpreted the amazingly difficult score with masterly skill. Scenically, the opera is a gem. The terrace in the Palace of Herod, with the cistern in which the prophet is imprisoned in the center and the Oriental attendants, soldiers and incense burners is remarkably picturesque.

Puccini in America

With the exception of Boito, America has now welcomed all of the prominent composers of Italy. Perhaps the word welcomed is not appropriate in the case of two of them, for the composers of "Cavalleria Rusticana" and "I Pagliacci" did not fare very well on these shores. Mascagni came here with the strange idea that he could produce, at top-notch prices and with second-rate singers, operas of his which had failed even in Italy; the result being a great disappointment. Leoncavallo was no better advised. He toured the country with an old-fashioned operatic concert company, singing selections from his "Pagliacci" and his unsuccessful operas. Special emphasis was placed on his orchestra, which was advertised as the famous band of Italy's greatest opera house, the Milan Scala. Now, while the *News*, of Butte, Mon., doubtless went too far in calling these players "an underpaid, incompetent bunch of organ grinders," they certainly were not accomplished enough to save the day, and so Leoncavallo also came to grief.

Much more fortunate is Giacomo Puccini, who arrived in New York on January 19th, a few hours before the first performance in America of his opera, "Manon Lescaut." There was no uncertainty whatever as to his fate. Mr. Conried had sent him an invitation, accompanied by a check for $8,000, to spend a month in the American metropolis to attend a Puccini cycle—in other words, the performance of four of his operas. He was not even asked to conduct them, as it is well known that he has no faith in his ability in that line; all he is expected to do is to be present and look pleasant while some of the greatest artists in the world sing his music. Possible he may give a hint or two, but there is little need of that, as his

GIACOMO PUCCINI.

operas are not in the least cryptic and not difficult to interpret, with the exception of "Madame Butterfly," which Miss Farrar considers the most difficult rôle in her repertory. Most of the Puccini rôles are easy, for good singers, and they are so idiomatic, so soothing to the voice and so facile and effective that all the vocalists love them—which is the main secret of Puccini's success.

Puccini was greeted at the performance of "Manon Lescaut" with extravagant enthusiasm. It is well known that he divided the honors of the last musical season in London with Wagner, and in

New York the indications are that he may even forge ahead of Wagner—for a time. Two of his operas—"Tosca" and "La Bohème"—have for several seasons been favorites here; his latest, "Madame Butterfly," had a run of fifty nights this season at the Garden Theater, in Mr. Savage's English version; and early in February Geraldine Farrar and Caruso will sing it in Italian at the Metropolitan. It is in the staging of this that Puccini will probably try to earn the money the manager paid him. It is his best work, so far.

Far inferior to it, from most points of view, is "Manon Lescaut," as might have been expected from its neglect by foreign opera houses which have his other operas among their staples. Auber, Balfe and Massenet also have written operas on the Abbé Prévost's once fa-

OSSIP GABRILOWITSCH.

mous and admired story of the fickle coquette and her adventures, but none with success, which is not a matter for regret. Unlike Massenet, who lets Manon die on the way to Havre, Puccini follows the foolish story across the ocean to a "desolate, dreary plain on the outskirts of New Orleans," where Des Grieux in vain hunts for water in the desert and finally dies of exhaustion shortly after his beloved has given up the ghost.

There are some charming musical numbers in the score, including a madrigal and a minuet in ye olden style, and there are some excellent specimens of the composer's skill in producing "atmosphere" by means of orchestral coloring—in the harbor scene, *e. g.*, and in the desert. Melodically, there is little that one remembers; but with a cast including Caruso the opera may hold its own for a time.

Gabrilowitsch and Scriabine

Apparently the "piano player" has already had its effect on the pianists. Unable to compete with it in velocity and brilliancy of execution, they have thought the matter over and come to the conclusion that their salvation lies in relegating virtuosity to a secondary place and assiduously cultivating those sensuous, emotional and intellectual aspects of the art in which no mechanical instrument can compete with them.

The young Russian pianist, Ossip Gabrilowitsch, is a case in point. When he last visited this country his main ambition seemed to be to astound his hearers with dazzling feats of execution. He has now come back a changed man. His technic is even more brilliant than of yore, but he now subordinates it to the music itself, seeking to show off its beauty rather than his own digital dexterity. His performance of the first Tschaikowsky concerto at a Philharmonic concert was one of the most enjoyable incidents of the musical season, rendered doubly so by the superlative eloquence of the orchestra under Mr. Safonoff, the greatest interpreter Tschaikowsky has ever had.

Subsequently Mr. Gabrilowitsch gave a recital at Mendelssohn Hall which aroused a really remarkable degree of enthusiasm. He was hardly at his best in the Bach numbers on his program, excepting a gavotte as edited by Saint-Saëns, which he made as entrancing as

a modern Viennese waltz. He had to repeat it. He sang the melodies of some Schubert pieces like a prima donna; he played the Chopin B flat minor sonata with the leonine power, in the first movement, of a Rubinstein. He made known some meritorious preludes by the late Arensky. At the end he gave a theme of his own with variations which were not particularly interesting. He has yet to prove that fate intended him to be a composer; but he is a notable artist in the remarkable group of modern Russians who are invading this country as never before.

Another eminent member of this group is Mr. Alexander Scriabine. Unlike Gabrilowitsch, he is pre-eminently a composer rather than a pianist. He does, indeed, give recitals, playing his own pieces chiefly; but his colleagues, Lhévinne and Gabrilowitsch, play them more effectively than he does himself, and he has made up his mind, it is said, to give up playing and devote himself entirely to composing.

The fertility of this composer is remarkable. The pieces he played here were chosen from a list of over two hundred he has written for pianoforte alone, and he is only thirty-five years old! Among his orchestral works are three symphonies. He made his American début with his own pianoforte concerto, an effective composition, with Safonoff at the conductor's desk. He reminds one of Chopin by his style and the mood and the harmonies of some of his pianoforte pieces. Like Chopin, too, he is fragile, with no trace of the Cossack in his personality or his music. Maybe some of his pieces betray Russian local color; those heard here do not. His most popular piece at present is the nocturne for left hand alone.

Beside Scriabine and Gabrilowitsch, two other Russians, Lhévinne and Petchnikoff, have been prominent in the concert field of late. But they do not have it all their own way. There are Americans, too, who are winning laurels East and West; among them two pianists, Olga Samaroff, who, despite her name, is not a Russian, and Fannie Bloomfield-Zeisler, both renowned for their temperament. But of them more in our next report.

Art Notes of the Month

The Winter Exhibition of the National Academy, which closed on the 19th, was carefully selected, well hung, and on the whole fairly representative of our national skill in handling and our lamentable paucity of ideas. There is little use in

ALEXANDER SCRIABINE.

spending time wondering why our usual exhibition pictures have only a momentary interest when an art teacher and painter of the standing of William M. Chase can talk so much nonsense about art as he does in addresses to his school. Students are so rarely led to feel for quality and depth of subject matter, and the education of their own natures is so entirely neglected that the matters of method necessarily become paramount to them.

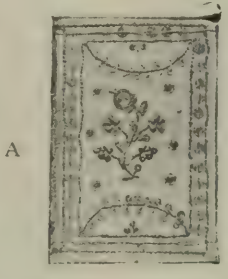
Many pictures at the Academy might fairly be called brilliant. Yet only a very few had any real esthetic force or power to evoke any sensation beyond that of momentary pleasure.

Paul Dougherty's great stony cliff jutting half way across the sky of his pic-

ture called "Land and Sea," with the mighty surge of the sea swinging against its resisting mass has titanic suggestions. This picture should become known thru repeated exhibition. Nothing else in this exhibition had its power of conveying the sublimity of forces uncontrollable by man. The "Gulf Stream," by Winslow Homer, purchased by the Metropolitan Museum, tho impressive enough in subject just lacks that touch of romanticism that would make it truly great. A small boat, rudderless and dismasted, tosses in the trough of the sea; while sharks play about waiting to devour its only occupant, a negro, looking astern for possible help. There is a water spout in the distance and much evidence of storm in the character of the waves, but in some way the canvas seems rather a collection of materials for a picture than a finished production.

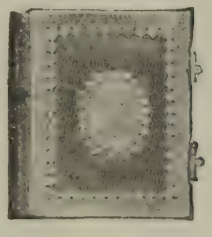
With the exception of Bryson Burrough's "Legend" and "Serene Sunset," there were no landscapes with figures that showed any intellectual conceptions. Burroughs is thinking more beautifully every year and must become a great painter as he becomes surer of his color harmonies. A newcomer among the

DOUGHERTY'S "LAND AND SEA."
In the National Academy of Design Exhibition for 1907.



men interested in landscape is Paul Moschcowitz, well known as a portrait painter whose use of color is particularly tender and sensitive. His "Sand Dunes" is the best of three pictures, and is very good indeed for a beginner in this field.

Of the portraits, Albert Sterner's canvas, showing his son, Harold, with a big wolfhound, had most intimate charms of color and arrangement. Miss Beaux's portrait of R. W. Gilder, and S. J. Woolf's of Mark Twain were very differently rendered portraits of two celebrities.



Louis Loeb's "Miranda" had the merits and faults of this painter. Abbey's "Sylvia" was gorgeous enough in color. Luis Mora paints more and more like a good Spaniard, but keeps awkwardness of drawing that hurts his work. Ballin's "Sibylla Europa" was decorative in color and rather painfully symbolic. Nothing among the smaller number of pieces of sculpture shown had any distinguishing quality.

To go from any one of the annual exhibitions to some small gallery, where the work of one man can be seen by itself, is often to experience almost a reversal of feeling as to the tendency among our men. The exhibitions of Montross's gallery showed us first the mature but always growing painter, Alden Weir, whose high key yet allows for infinite gradations of musical tone in his color, and whose love of beauty is a power enabling him to find it in "A Factory Village" with smoky chimneys, as well as in a stately park that makes an almost classical setting for "The Return of the Fishing Party," composed of pretty women who cross a stile, and, small in scale, make decorative spots among the green masses. His "Memories" and "The Pink Bodice" are beautifully felt half-length figures. His masterly handling of the etcher's tools was also made apparent at this exhibition.

Since the Weir's there have been hung at the Montross gallery some twenty pictures by a younger man—Howard G. Cushing—thru all of which can be traced in color and taste the influence of the peculiar beauty of the artist's wife, a red-haired, slanting-eyed young lady with a fondness for long white robes and filmy wraps. But Cushing may eventually go deeper in color if he works hard at the same type, for he already makes good combinations, tho his technic reduces everything to the texture of chenille and he often draws hands and arms very badly.

A

B

C

At Kraushaar's, until February 4th, will be fifteen canvases by Allen B. Talcott, some of which show a surprisingly poetic temperament, and all of which give us nature seen thru healthy eyes. The lovely "Springtime," by Mauve, from the Alexander Young collection, is also at this gallery.

Mr. MacBeth's presentation for the month was of the work of the veteran, William Sartain. Here we find knowledge made perfect by skill. Nothing jubilant or striking appears. His thoughts go deep into the real color and drawing of things. He is content to choose the broad expanse in which a distant horizon appears oftener below the middle of the canvas than above, so that the skies woo the attention first, and the eye wanders in the mysteries of delicate gradations of tone. The three greatest landscapes shown are, perhaps, "The Meadow," in which cheerful distant evening clouds sail far away from an extensive stretch of darkening meadow in which Sartain's own lovely browns and olives intermingle; "The Cloud," in which again we have an expanse of

MINIATURE BOOKS AT THE BONAVENTURE EXHIBITION

A—Miniature French Almanac, thirteenth year of French Republic. Embellished with fine copper plate illustrations. Silk embroidered binding with spangles.

B—Miniature Old Testament from Genesis to Maccabees in copper plate pictures, 131 in number. Bound in red Morocco. Fine silver filigree ornamentation, with silver placket in center of both front and back Sixteenth century (German)

C—Marie Antoinette Scent case. Arms of the Queen. Bound in red Morocco. Contains two rock crystal bottles.

marsh uninterrupted by any definite mass and overhung by a billowy pink cloud painted in a way to make our young landscapists gnash their teeth with envy; "First Snow," with soft bluish gray sky and tenderly managed young trees in masses on either side of a gradually mounting snow-covered way. A fourth "great picture" might be selected and the choice could fall upon "In the Mountains of the Basilicata," a wonderful yellowish green picture with slopes of hills and cliffs converging on a mysterious valley that drops us down into unknown depths.

At Knoedler's is another of the portrait exhibitions so often to be seen there. This time the works are by Emil Fuchs and show us thirteen male and female Americans as seen by a foreign painter. Evidently to him all American women have very much rounded chins of one pattern and hands and bodies with no character at all, and very ropy hair, but effective hats and gowns and furs. The men are better understood, especially the jovial Mr. Sidney Smith with his cigaret and his spats so much in evidence.

At Duveen's is a remarkable loan collection of Chinese porcelains, and at the National Arts Club a showing of German pictures from the collection of Mr. Reisinger, and the Vernon collection of kimonos.

Miniature books, while not exactly suited for reading, nevertheless make a strong appeal to the bibliophiles. Such books are in most cases valuable only as curiosities, altho the workmanship frequently lavished upon them is exceedingly artistic. The technical difficulties of producing a book that measures only one-quarter of the size of an ordinary postage stamp are very much greater than are those encountered in producing the ordinary book. The collection of miniature books made by Georges Salomon, of Paris, is said to have been the largest ever gathered together. A collection of these books, numbering more than two hundred, made by the late S. P. Avery, was recently presented to the Grolier Club, of this city, by S. P. Avery, Jr., which collection will soon be installed in a special display case at the Grolier Club house. The Bonaventure exhibition of these miniature books held last month contained a notable gathering of such books two of which are reproduced in this issue. Another interesting object shown at the same time at the Bonaventure galleries was the scent case of the unfortunate Marie Antoinette.

The Drama

The most important events of the month in the dramatic world are the Ibsen plays, given by the gifted Russian actress, Madame Nasimova, and Sudermann's biblical play of "John the Baptist," by Marlowe and Sothern.

Sudermann's "John the Baptist" would attract particular attention just now, if for no other reason than that it offers such a contrast in motive to Strauss's opera, "Salome." The motive of the opera is horror. And in spite of the fact that it is an entrancing and terrifying miracle in music, no one may yield to the spell of Strauss's Salome without sustaining a moral injury, without descending into the realm of spiritual decadence. The term maiden may be applied to her only to bring out more clearly the contrast between the idea it suggests and the revolting license of her mind, which is more than barbarous and heathen in the subtlety of her horrible suggestion. Sudermann's play contains two distinct themes and conveys the whole of two distinct meanings. In the first part the purity of the religious motive is preserved with thrilling power. It is probable that Mr. Sothern has never done more credit to his art than in his portrayal of John's confusion concerning the meaning of his own ministry. John is obliged to conceive of what has never been conceived before—the perfect law of love, to rise thru some power of the spirit to a moral dignity as yet incredible to his mind. And Sothern does it. But from the point where John recognizes this law of love and refuses to cast the stone at Herod, the theme changes and becomes the revenge of Herodias. Opinions of the Salome of this play will differ, but it is unquestionably Miss Marlowe's purpose to convey an impression of the wild, shameless innocency of this young fire-bred, passion-fed pagan. It is not purity as we know the meaning of the word, but it is the grace of untamed brutal virginity which expresses its fury and its loveliness in

the shameless dance of Salome. It is not moral now to approve such a woman who was so easily within the standards of her own day, but if we must have Salomes on the stage we may at least be grateful to Miss Marlowe for putting no more bad into the part than the original daughter of Herodias conceived of. And the fact that she goes mad at the sight of the head of John the Baptist (a sight, by the way, which the audience is spared) is more nearly the right *denouement* for our times than the monstrous fascination for the horror which Strauss's Salome shows, altho the real Salome was probably too steeped in the custom of horrors to feel such poignant revulsion at her own act. Besides, it justifies Miss Marlowe's conception of Salome, confirms her innocency and proves her to have been merely the pretty, childishly unscrupulous instrument of her mother's revenge.

For the first time in America Ibsen promises to become popular. So great was the demand for seats for "A Doll's House," given only in odd matinées, that last week Mme. Nazimova and her company moved over to the Bijou Theater for nightly performances. In Mme. Nazimova we have a new star who actually promises to be one of the world's great actresses, if she is not already one now. Her portrayal of Nora in "A Doll's House" is the best that we have seen, and far ahead of Mrs. Fiske, who many think is America's greatest actress, and this despite the fact that Mme. Nazimova has only studied English for the last year and a half. Mme. Kalich, who made such a furore last year when she graduated from the emotional *rôles* of the Bowery to a Broadway house, had an eradicable Yiddish accent, but Mme. Nazimova has hardly any foreign accent at all, and gives promise of declaiming without any whatever in a very short time. In grace, vivacity and sheer naturalness of acting her Nora was wonderful, and her fine face, with its remarkable flexibility of expression and her wide range of tone, qualified her for Ibsen's or any other playwright's heroine. This is no place to discuss the philosophy of "A Doll's House," which has been the subject of discussion in all literary and dramatic circles for years. Every one who can should not fail to see Mme. Nazimova and her splendid company in the play which has created a new epoch in the drama of the world. Madame Nazimova's interpretation of "Hedda Gabler," which has had an unexpected long run in New York, is interesting because she gives a new version of this most complex of the Ibsen women, a version that induces more sympathy for Hedda because it emphasizes the physiological side of her peculiar mental state.

MAUDE ADAMS AS PETER PAN.

Clyde Fitch's latest play, "The Truth," really ought to be called "The Liars," because the whole plot depends upon the

atrocious fibbing, for no other reason than the very love of fibbing, of an otherwise exemplary young wife. Indeed, she fibs so much that when for once it is necessary for her husband to believe her implicitly, he thinks then she is lying, and hence the chance for a plot. The play is perhaps above Mr. Fitch's average, which means that it is a comedy of considerable interest. Clara Bloodgood, who takes the part of the fibbing wife, is remarkably good in the comedy parts, but is not quite up to the serious emotional climaxes, even tho she has the faculty of shedding real tears. The rest of the cast, especially the fibbing wife's fibbing old father, are excellent.

Mr. Clyde Fitch as a playwright and Miss Blanche Walsh as an emotional actress are so well known that it is only necessary to say that they have combined to produce "The Straight Road" for the play-going public to know at once what the play is. It is a well-made play, well acted and deservedly popular, yet one would not suffer a great loss by not seeing it. The obvious theatricality of its plot is counterbalanced by the naturalness of the acting. The character of Houston Street Moll, who is put upon the straight road by the efforts of a settlement worker and who keeps to it even when her benefactor turns against her, is well portrayed, for Miss Walsh is one of the few actresses who are willing not to look pretty, graceful and well dressed when their parts require them not to be. Some good genre acting is also done by Miss Helen Lowell, better known as Miss Hazy, in "Mrs. Wiggs of the Cabbage Patch."

A whole play consists of the acting upon the stage and of the effect of this acting upon the audience. Thus "Peter Pan" has become a whole play because Barrie planned it upon the theory that fairies are the natural saints of all childhood, and because Maude Adams has made it a sweet incantation by which she carries the men and women who see it back to that period of innocence and delight when they had more of the fairy than the mortal mind. But, for the same reason, "The Road to Yesterday" is not yet a whole play. The audience has not consented to take part in it. Those who see it are not antagonistic, but they are nonplussed. The explanation is that most people understand the past only as they are related to it by history, not by the reincarnating process in this comedy of fantasy. It covers a period of three hundred years in four acts, retaining thruout the same characters. Minnie Dupree in the leading *rôle* passes like an inspired somnambulist back into the centuries, taking the other people in the cast with her. Incidentally, she shows the crudities and absurdities of the average historical novel by her whim-

ALLA NAZIMOVA,
In "A Doll's House," at the Bijou Theater.

sical comments upon the commonplace reality of seventeenth century life, but the chief charm of her acting shows in the wit and lightness with which she keeps a personality that varies but does not change, so that the audience recognizes the same coquettish facetiousness in the little serving maid of the Red Swan Inn that she reveals as the twentieth century American girl in the first and last scenes. But not even with Minnie Dupree to pass back and forth between the old and the new life and contradict our conceptions of both has it become a whole play. The audience will not yield

the point to her. For that would mean turning a kind of intellectual somersault and looking backward between the legs of time, Peter Pan fashion, at one's own image. And this is more mental agility than the average men and women have in an evening.

Eleanor Robson, who is already so well known in the part of Merely Mary Ann, is likely to increase her popularity as Salomy Jane in the play adapted from Bret Harte's California idyl, which is now on at the Liberty Theater. Her attempt, however, to imitate the Southern girl's drawling speech and listless manner is as diverting to Southerners as it is fascinating to New Yorkers who have never learned much of the character of poor whites of the South beyond their absurdities and limitations. But the play is significant for this very reason, because it is founded, not upon what is vital, but upon what is extraneous and ridiculous, upon the mere accent of life rather than upon life itself. The real Southern white of whatever class is as far from having been interpreted to a Northern audience as the negro is far from it in a minstrel show.

Mr. Wilton Lackaye has been desirous for some years to appear in "Les Miserables," but he says that he has not been able to find a manager to produce it "or even pronounce it." Accordingly, he has dramatized it himself under the title of "The Law and the Man." It is obviously impossible to put upon the stage with any completeness this cosmical romance, but the lovers of Hugo will find it interesting to vivify their impressions by these selected scenes from the life of Jean Valjean. To others the plot will be somewhat unintelligible, because of the omission of connecting links. For example, there is no apparent cause for the relentless pursuit of Valjean by Javert, which is the motive of the play. Then, too, Hugo's melodramatic scenes, taken apart from their setting of grandiloquent prose and voluminous detail, appear very crude. The effective use of incidental music in connection with this play suggests that a good opera might be built upon "Les Miserables." "Caught in the Rain" is a farce in three acts by William Collier and Grant Stewart. Its humor depends more on the pun and repartee than on any subtle subjective psychology. Nevertheless, its fun is funny and will keep the average theatergoer in a state of unalloyed merriment from curtain rise to fall. The cast is capital, and the situations are fresh and unhackneyed. The play ought to have a long run.

A foreword to the dramatization of George Barr McCutcheon's amusing story, "Brewster's Millions," states that the object of the play is to amuse and to present a wholesome entertainment. It is a distinct success in both respects, for the humor of the absurd situations and the keen hits are as original as the play itself is clean from start to finish. A young man finds himself in the peculiar predicament of having to spend a fortune of a million dollars in one year, in order to inherit another fortune of seven millions. The declining stocks he buys rise sensationally; the wind-broken horses he bets on win unexpectedly; an unpromising soubrette that he financially assists makes the hit of the season, and he finally most unwilingly breaks the bank at Monte Carlo. The setting in the third act, where Brewster's steam yacht is caught in the storm and rendered helpless, is a triumph in scenic effects for Thompson & Dundy. The salvage which the owner has to pay enables him to qualify for his inheritance.

In "The Student King" Mr. Reginald de Koven has returned to the old-fashioned form of comic opera as it was before it was enticed into Oz, Sulu and other fantastic realms. In the student life of old Prague he finds sufficient mirth and music for the foundation of an opera, and he avoids the temptation to make it a mere string of vaudeville turns. A commendable feature is the unusual number of good male choruses. It is a pleasure to find a comic opera nowadays which does not depend for its success on vulgarity and indecent suggestions.

The Shout for "Big Ships"

BY PARK BENJAMIN

WE possess at the present time 27 battleships, built and building, which have, or will, cost for hull and machinery about $90,000,000. Of these vessels the newest are the "Michigan" and "South Carolina," authorized by Congress, March 3d, 1905, and contracted for at an outlay, for the hulls, of about $3,500,000 each. These great sister ships are 450 feet in length and of 16,000 tons displacement. Their armor has a maximum thickness of a foot, they each carry eight 12-inch guns in four turrets, and they are expected to make a speed of over 20 knots per hour. They represented, presumably, at the time of their authorization the most formidable vessels we were able to design. Work upon them now has little more than begun.

Last June, and before the contracts for these ships were even signed, Congress authorized another battleship vaguely defined in the act as "carrying as heavy armor and as powerful armament as any known vessel of its class, to have the highest practicable speed and greatest practicable radius of action, and to cost, exclusive of armament and armor, not exceeding $6,000,000."

Some months earlier Secretary Bonaparte had suggested the possibility of breaking up the old frigate "Constitution," and, as part of the public protest aroused, there was proposed in Congress the building of a big ship around that historic name. There already existed, both in the navy and out of it, a party somewhat fanatical on this subject of "Big Ships"—meaning thereby vessels always bigger than those which we happened to have, carrying more guns of a single, and that the biggest, caliber and permitting by their greater size of higher speeds and also the instalment in them of everything anybody could possibly suggest as desirable to put into a man-of-war. The big "Constitution" proposal and the efforts of these advocates culminated in the authorization of the six million—really with arms and equipment ten million—dollar vessel, and then followed the sedulous explanation that she was our "answer" to the formidable recently launched British "Dreadnaught."

Why we should want one ship of gigantic proportions wholly unco-ordinated with our existing fleet and incapable of team-work with it, without sacrifice of many important advantages supposed to be gained by her size was a mystery. Why, before we had even started building the "South Carolina" and "Michigan," let alone before having tried them or learned practically anything from them, we should rush to construct something greatly different was another mystery. Why on theory—academic theory, pure and simple, part mathematics and part guesswork—we should with such precipitation embark upon this new and isolated enterprise was the greatest mystery of all. For the Big Ship contentions have no basis in practical knowledge derived from actual conflict of modern fleets embodying the new departures, and the Big Ship is evolved—even as the German naturalist evolved a camel—solely by the exercise of a vivid and ebullient imagination. Even the very naval officer to whom rumor assigns the place of chief Big Ship advocate has never commanded a battleship in his life nor anything bigger than a small cruiser, nor served even as a subordinate on a modern battleship of the first class. Naval history certainly does not support the Big Ship arguments; but, on the contrary, the principles derived from the great fleet actions of the Revolutionary and Napoleonic wars are against them. From 1793 to 1815 the British ships of maximum *moderate* power constantly increased in number, while the big ships of the day, the 120-gun and other three-deckers, decreased or made no advance. When these wars ended, victorious England had eighty-five 74-gun battleships and but fourteen of greater power, altho France was not destitute of big vessels.

The Navy Department proceeded to prepare a "tentative plan" for the ten-million-dollar giant, and laid it before Congress in secrecy, except in so far as it has leaked out that the scheme contemplates five turrets on line and ten 12-inch guns. Now before that plan has been made public or even accepted we are suddenly advised to build still another Big Ship — with a further intimation pointing to building four. Of course, no one doubts the necessity of progress in warships as in all other machines—or fails to see that the advance in existing types has, of late years been rapid; but this is naval progress with a vengeance, and at a speed little else than breathless. But it is not all to which the Big Ship theorists are trying to commit the nation; and to their end and object, as well as to the way in which it is being compassed, public attention is invited.

On January 13th last, Senator Hale, Chairman of the Senate Naval Committee, presented to the Senate two papers, which were deemed of sufficient importance to be printed in full in the *Congressional Record*—a somewhat unusual proceeding. One is an essay by Captain Mahan entitled "Reflections, Historic and Other, Suggested by the Battle of the Japan Sea," and its companion is a long dissertation on the tactical qualities of large battleships by Lieutenant-Commander William S. Sims, of the Navy. From the lay point of view both papers are technical—and the general reader, in endeavoring to follow their arguments might easily fail to perceive the real effect of their publication—which is nothing more nor less than to prepare the country for the precipitate antiquation of its present entire battleship fleet and the building of another, of vessels of greatly increased size and power.

In still another aspect, this publication is remarkable. Whatever object Senator Hale, who certainly does not belong among the Big Ship advocates, may have had in view, the publication amounts not merely to the presentation of the Administration's arguments *via* Lieutenant-Commander Sims—but to the public immolation of Captain Mahan, now the most dangerous of all obstacles in the way of their acceptance. However much the incursions of that distinguished writer into the fields of ethics and diplomacy may have justified question, it is indisputable that as an authority in the interpretation of naval history and its lessons no one equals him. In the essay reprinted by the Senate he keeps well within the area in which he is supreme. It was originally contributed to the June, 1906, number of the *Journal of the Naval Institute*. Upon the facts of the Battle of the Sea of Japan so far as then known to him and upon his deductions from these facts he reaches conclusions supporting certain principles. And from his understanding of the effects of secondary battery fire (by which he means the fire of naval guns of from 6 to 8 inches caliber) he derives other support. The net result is an opinion based on broad principles (illustrated as he then considered by the specific data found or deduced) so emphatically adverse to the Big Ship—or more correctly, perhaps, to the Administration's suddenly acquired Big Ship policy—as to amount to positive condemnation. He says:

"Practically the navies of the world have now committed themselves to solving their problem by progressive increases of size, which affect national expenditure in two principal ways: first, increase of cost by bigger ships, and, second, by prematurely relegating to the dump vessels good in themselves, but unable to keep up with the one last built. Today's "Dreadnaught" has no immunity from the common lot of all battleships. In a fleet today, her speed will be that of her slower sisters; more "Dreadnaughts" must be built to keep up with her; and upon them in turn, according to the prevalent law of progress, she will be a drag, for her successors will excel her.

"This wilful premature antiquating of good vessels is a growing and wanton evil. * * * Our present conception is that of abandoning all attempt at a guiding conception of types or standards, except the crude one that each ship must be bigger than the last. The ultimate tendency of this, of course, will be to make ships after too short a time unequal to a place in the line. The moral effect of this is still worse, for it is inducing in the Navy as in the public, a simple trust in bigness, and, what is worse, an absence of trust in anything but bigness."

As if foreseeing the later recommendation in the Presidential message that we should build one battleship per year equal to the best under construction abroad he further says:

"But the fast battleship built this year will always find her speed conditioned and lowered

in the same way by that built three years ago so long as the standards of size and consequent speed *depend upon the ship your neighbor is laying down. We are at the beginning of a series to which there is no logical end, except the power of naval architects to increase size.*" (My italics.)

There is no disputing either the gravity of this warning or the force of the authority behind it. Equally there is no gainsaying the effect of that sort of denunciation upon any undertaking against which it may be publicly directed—nor the absolute need on the part of the promoters of doing something, and that quickly, in order to break its effect.

There happens to have been published in the same number of the *Naval Institute Journal* which contained Captain Mahan's essay a paper on the Russo-Japanese battle by Lieutenant R. D. White, U. S. N., based on information given him by a Russian observer on the spot, wherein certain data hitherto unknown or indefinitely known are stated with precision. Some of these observed facts do not apparently accord with Captain Mahan's deduced facts—and naturally to this extent the battle, as a specific illustration, possibly no longer supports the principles laid down and derived, as already stated, from all past naval history. Upon this basis Lieutenant-Commander Sims finds Captain Mahan's conclusions not only "in error to a greater or less degree," but, in some cases, to be apparently "in effect diametrically opposed to the truth."

Apparently Captain Mahan had not seen Lieutenant White's paper, prior to the original publication of his own, for Lieutenant-Commander Sims says that "if when Captain Mahan wrote his article he had been in possession of certain information (White's) that has *since* become available, his conclusions would have been considerably modified." (My italics.) But it is, to say the least, surprising that the far more important present republication of his essay, with all the solemnity of Senatorial presentation, should be without a line to show whether, six months after the event, he does or does not concede to Lieutenant White's facts the destructive importance which Lieutenant-Commander Sims finds in them. Either Captain Mahan has reaffirmed the conclusions of his essay or he has not. If he has, the public is not only entitled to have the fact stated, but such rebuttal of his critic as Captain Mahan may think proper should be a part of the present publication. If he has not, the paper as now republished does not exhibit his present opinions, and in that case is unjust to Captain Mahan and misleading to the public.

Again, commenting on Captain Mahan's alleged error in advocating the continuance of secondary guns, Lieutenant-Commander Sims ascribes this to the fact that "much important information concerning the new methods of gun fire was not considered by the author in preparing his article," and yet admits that "these methods of gun fire cannot at present be specifically explained in a published article, as this would involve a discussion of our methods of controlling our ships' batteries," etc.

If there is nothing published which can be appealed to in order to convict Captain Mahan of error, and if this information is, in fact, secret, how can statements which must have been guarded by Captain Mahan in order not to reveal what should not be revealed possibly form the basis of a charge of simple ignorance? Captain Mahan does not generally exhibit that failing; rather the reverse, even to an *embarras de richesses.* Furthermore, the republished Mahan paper has nothing added to show whether Captain Mahan admits this impeachment of ignorance or not, altho the negative may perhaps safely be assumed.

Lieutenant-Commander Sims's final assignment of error, namely, Captain Mahan's "failure to consider the inherent and very important tactical qualities of large vessels," may be passed without comment, further than to remark that others know, even if Lieutenant-Commander Sims does not, that Captain Mahan's "consideration" of this very subject has extended over a period probably longer than his critic's professional lifetime.

Now, can any one, in the circumstances, fairly regard these two papers as *the* complete arguments *pro* and *con* on this most important question? Is it right, even successfully, to attack an illustration and thereupon affirm that the

principle has failed; or to leave the public in doubt whether or not the party defendant concedes the failure, or has a complete answer to his assailant? Might not Captain Mahan's position, not merely before the world, but as his military superior, have fairly suggested to Lieutenant-Commander Sims himself some indication in his attacking paper as to whether Captain Mahan had or had not previously declined to modify the conclusions based on the disputed facts? Is it possible that Senator Hale has been misled into really assisting the Big Ship shouters in impugning Captain Mahan's troublesome opposition? In any event, is it to the public interest?—for if the "breathless" building of big and even bigger ships is wrong, are not the warnings of such an authority as Captain Mahan the last which should be obscured or stifled; and if it is right, why choose a course which subjects it to unmerited suspicion?

What, in fact, is this suddenly developed so-called "Big Ship" policy, which its promoters are apparently unwilling to advocate without resort to such dubious help as the foregoing indicates, and which, by the way, Mr. Edwin S. Cramp, vice-president of the William Cramp & Sons Ship Building Company, has just taken occasion to assure the public is, in his opinion, a "good one"? According to Captain Mahan, it is simply to go on empirically building bigger and bigger ships until available money gives out, or naval architects reach the limit of possible achievement, meanwhile consigning the big ships of yesterday to the scrap heap regardless of intrinsic value. Lieutenant-Commander Sims observes:

"It seems to me that the mere fact of there being a common demand for such large vessels" (by "Naval Officers," and now by Mr. Edwin S. Cramp) "is *conclusive evidence* that there must be a common cause that is believed to justify the demand. * * * It would undoubtedly be desirable if we could procure an international agreement that no nation would adopt for its armies a rifle superior to that now used. Similarly, it would be desirable if the displacement of men-of-war could be limited to, say, 20,000 tons. But in the absence of such an agreement, we must keep pace with the increased efficiency in battleships, as well as in small arms. *We have no choice in the matter, if we are to remain a world power.*" (My italics.)

If it is true that we have "no choice" and that we confront merely a case of "needs must when the devil drives," why do the Big Ship promoters insist on inflicting upon us these inordinately long and labored technical arguments such as that of Lieutenant-Commander Sims? Why do they continually hammer on such obvious platitudes as that four ships at a given distance apart carrying ten guns each will make a shorter line and so concentrate their fire closer than five ships similarly separated and carrying eight guns each? Or, since Lieutenant-Commander Sims estimates the maintenance cost of "*a* battleship" at a million per year, that the expense of keeping up ten ships will be half the outlay for twenty?

If *force majeure* is going to *make* us do what they demand, of course we must concede, if only to save our face, that their Protean craft, whatever it may be at any instant, is better than the immediately preceding object of their devotion—and, perhaps, seek for comfort in the existing general craze for bigness which is resulting in 49-story buildings in New York—altho these are to last indefinitely, while battleships die in ten years or less. But what has concession to do with it? Captain Mahan's finger continues none the less directly and inexorably to point at the crux of the matter. Nor is it apparent how any possible fatuity can get it out of sight any more than the publication of the two papers above noted can prevent the stern public demand. How long is this dearly bought equality or superiority to last, and where is the end of it?

The fleet of ten big overtopping ships which Lieutenant-Commander Sims treats, and no doubt would like us to treat, with easy familiarity, will, on his own argument, be open to defeat, for precisely similar reasons, by half their number of still larger ships; and these, in turn, by a still smaller number of vessels bigger yet; and, finally, what is to prevent (*pace* the naval constructors) the reduction (*ad absurdum* if you like) of the last pair, like "two single gentlemen rolled into one," to an isolated and massive identity? Think of that! Perhaps but one ship may be needed to scare off the effete navies of Europe from the Atlantic, and another to keep all Asia

from over-populating the Pacific Coast. A third might lead the Japanese even into a hasty subsidy of the California labor unions—another free down-trodden Ireland—another smash the Anglo-Japanese treaty of a summer morning. Add one more to regulate the continent of South America, and what it really means to be a "world power" may begin at last to dawn upon us. As for the expense, a national income tax and a national inheritance tax and a national tax on "swollen fortunes" will more than meet it. Is the final conclusion from Lieutenant-Commander Sims's teaching that we want merely one navy? No! several navies—each condensed into a tremendous unit! *E Pluribus Unum!*

If we must be technical, is there a single advantage which Lieutenant Commander Sims claims for his ten Big Ships not equally gained by our one Enormity? Will she not require fewer officers and men, cost less to dock (if there is a dock), concentrate the most tremendous fire, carry a small coal mine, care (theoretically) for torpedoes no more than for so many firecrackers, maneuver in whirls, if she likes, by the aid of colossal engines and multitudinous propellers, and be capable of annihilating everything else afloat as easily as our brand new "Connecticut" could dispose, single-handed, of the united fleets at Trafalgar? All this until somebody else startles the universe with something unimaginably bigger, which we humbly trust may not be heard of in Washington before the preceding Biggest is paid for.

But conceive the profound satisfaction, while it lasts, of making our foreign (always) enemies at once jack up, so to speak, to our standard instead of ourselves meekly imitating theirs once a year!

The progressive Big Ship sequence of recent events may be summed up diary-fashion as follows:

"Winter of 1905-6:

1. "'The Constitution,' the remaining scraps of which Bonaparte sneers at, is a fine name, and we ought to have a new ship built around it."

2. "Of the most powerful character, to cost $6,000,000."

3. "But the Navy Department wants to keep its hands off this. Every Congressman is a competent Naval Constructor, Mariner and Artillerist, and *we* will settle the plan."

4. "Meanwhile, let the William Cramp & Sons Ship Building Company, by all means, go ahead with the 'South Carolina,' and same instructions to the 'Michigan's' contractor."

5. "What we authorized last June was a 20,000 ton ship with five turrets and ten guns. We know we meant that because we have since been told so."

"1907:

6. "Let's build another Big Ship. We can just as easily settle two plans as one."

7. "Let's build a Big Ship every year, and meanwhile let's talk about four of them."

8. "Let's get rid of all the battleships we have, quick, by applying to them a law which sends them into the dump if they need repairs costing more than ten per cent. of the original price. (Thunders of applause from the William Cramp & Sons Ship Building Company.)"

9. "That man Mahan has put in his oar, and must be choked off. Set Sims to making him into what the late John B. Gough used to call 'a horrible example.'"

10. "Tell Sims to talk about more Big Ships; not four. TEN!"

(*To be continued.*)

And after! When will the whole battleship fleet of the United States be declared obsolete? Do the Big Ship shouters hold it so now or not?

NEW YORK CITY.

Good "Old Summertime"

BY JAMES H. WILLIAMS

Able Seaman.

We've sailed the salty seas together
Old shipmate, you and I;
And never cared a fillip whether
We slaved to live or die.

We crossed the wide Atlantic brine,
A tyrant in command;
And our fingers bled, till the sails were red,
On the banks of Newfoundland.

We've slanted thru the brimming Trades,
Where storm-clouds never frown.
We've raged the Roaring Forties thru,
And rushed our Easting down.

We've sunk the Pole-star far below,
Sailed 'neath the Southern Cross.
Where fitful jack-o-lanterns glow,
Nor did we count it loss.

I cannot tell the deeds we did,
When we were in our prime,
But I think of you, as I do of few,
My dear Old Summertime.

I tell the world my careless tale,
Because I love you well;
Your voice is vast as a trumpet's blast,
But clear as a silver bell.

And when I clasp your hardened hand,
Old shipmate, it is bliss;
Your grasp is strong as an iron thong,
But true as a maiden's kiss.

The wonder is to all the world,
That we are still alive;
We fared upon a barren rock,
For four-score days and five.

Where shall I find a stauncher friend,
A spirit more sublime,
My last and only sou-markee
For you, Old Summertime!

New York City.

The Census and the Socialists

BY W. J. GHENT

Author of "Our Benevolent Feudalism," "Mass and Class," Etc.

BULLETIN NO. 57 of the Census Bureau furnishes an excellent confirmation of Socialist analyses of present-day tendencies in industry. This bulletin gives a statistical statement of the first quinquennial census (that of 1905) of manufactures in the United States. Hand trades and petty industries are omitted, and the figures relate only to "establishments conducted under what is known as the factory system." The schedules used are virtually identical with those used in 1900, and accurate comparisons between the two censuses are thus rendered possible. The favorite refuge of census officials and other optimists in reply to unfavorable deductions drawn from comparisons of previous censuses has heretofore been the demurrer that, the schedules being different, no basis for exact comparison existed. This refuge cannot again be taken. For the first time we have approximately like standards of measurement.

That concentration increases steadily is a commonplace of Socialist contention The persistence, to a greater or less degree, of petty industries and petty mercantile houses is acknowledged, but the assertion is made that these minor establishments undergo a constant restriction of scope and revenue. They are the "refuge of the cripples of capitalism," as Vandervelde says—of men who seek with their small savings from industry to escape the drudgery of manual work. Tho they persist as to numbers, the individual units melt like bubbles in a stream.

It is also a part of the Socialist contention that, as concentration increases, as machinery is improved and as the volume of commodities is heaped up, the stress of the competitive struggle is in a measure transferred from the field of production to the field of distribution. The struggle is to sell goods to the last accessible human being. And so the number of workers in the purely productive industries remains virtually stationary (in many industries declining), while the number of those in clerical and distributive tasks increases.

Let us see what the Census Bulletin has to say concerning these two points.

First, as to concentration. There is a large increase in the amount of capital employed. In five years the total has grown from $8,978,825,200 to $12,686,265,673, an increase of 41.3 per cent. No one need doubt the truth of these figures. The nation's wealth advances by long leaps, and a great part of it is transformed into capital for the creating of further wealth, by enlarging or creating industrial enterprises. But the number of new establishments is inconsiderable. The increase is only from 207,562 to 216,262, or 4.2 per cent.—one-tenth of the rate of the increase of capital.

The remarkable extent of this concentration is shown by further figures. There are 71,162 establishments with an annual product of less than $5,000, and 120,920 with a product ranging from $5,000 to $100,000. The whole of these 192,082 establishments, however, comprising 88.8 per cent. of the entire number of establishments, produce only 20.7 per cent. of the total manufactured product. On the other hand, the 24,180 establishments producing values of $100,000 and more annually, comprise only 11.2 per cent. of the total number, but they produce 79.3 per cent. of the total value. Thirty-eight per cent. of the total values are produced by only 1,899 establishments—less than 1 per cent. of the total. "The organization of large establishments," says the Census Bulletin, "either by new construction or by bringing independent manufacturing enterprises under the same ownership, has been one of the conspicuous features in connection with the manufacturing industries of the country."

The increase in the number of wage-earners in manufacturing is also but moderate. We have had at least two years of unexampled prosperity, the number of immigrants (a very considerable portion of whom are of wage-earning age) has broken all records, and there has been an increase of population of probably 10 per cent. Yet the best the census can show for the increase in the average number of wage-earners is 16 per cent. A number of industries show distinct losses in the numbers employed, while others show but little change. Considering the factors mentioned above, this is virtually no increase at all. It is not sufficient to indicate steady employment for the out-of-works of the census of 1900.

But while the wage-earners show so slight a numerical growth, the salaried officials, clerks and the like advanced their numbers from 364,202 to 519,751. This is a gain of 42.7 per cent., a gain greater than that in the amount of capital employed. Even these figures, it should be remembered, give no adequate idea of the increase of the numbers of this class, since the numbers employed in manufacturing alone are considered. The greater bulk of the clerical and distributive workers is employed in other kinds of enterprises. Were it possible at this time to obtain figures of bookkeepers, clerks, stenographers, salesmen, packers, shippers, draymen, boatmen, railway employees and other miscellaneous groups of this class, a rate of increase considerably greater would no doubt be found. This class as a whole increased by 48.4 per cent. from 1890 to 1900. All present tendencies indicate a higher rate of growth for the last five years.

Modern industry is based upon the production of goods for sale. Concentration and improved processes pile up commodities in an ever-increasing volume, and the human struggle is more and more a conflict to sell goods. All means that human ingenuity can invent to bring wares to the notice of the last persuadable being and to persuade him to buy, are employed. The distant heathen and the remote squatter are alike pursued to their last refuge in the hope of selling them anything from glass beads to automobiles. The number of persons directly or indirectly employed in distribution increases. But despite this increase, despite the extensive and intensive cultivation of the market, despite the relative decrease of wage-earning producers, and the much more significant relative decrease in the number of productive establishments, the market continues to be fed with a swelling volume of goods which cannot be sold; and which threaten, sooner or later, a collapse of the prevailing system of production.

And what then? Well, the Socialists have also an answer to that, which he who cares may learn.

New York City.

Literature

Sturgis's History of Architecture

SINCE Fergusson's "History of Architecture," long the sole and unquestioned authority for English-speaking students of architecture, became antiquated by the rapid progress of recent scholarship in that field, nothing has appeared in English until very recently to take its place. Monographs and histories of particular periods and styles have been multiplied by English and American writers, and in French there was published a few years ago the admirable "Histoire de l'Architecture," by Auguste Choisy, which has rather surprisingly failed thus far of translation into English. A year ago, however, Prof. F. M. Simpson, of London, brought out the first volume of a general "History of Architecture," covering the ancient basilican and Byzantine styles; and we have now from the accomplished pen of

COLONNADE OF PHILÆ

From Sturgis's "History of Architecture." Baker & Taylor

Mr. Russell Sturgis, of this city, the first volume of a parallel undertaking.* Comparing this handsome volume with Professor Simpson's work, one notes at once its less technical and more popular character. It is evidently intended for the general reader rather than the advanced student, and lacks the character of a text-book and work of reference that marks the English book, and which one rather naturally looks for in a history of these dimensions. Its illustrations comprise only a limited number of plans or sections, and many of those it contains lack any accompanying scale. On the other hand, there are many picturesque views of buildings from photographs and a rather curious assortment of reproductions of engravings from miscellaneous sources, some of them of an antiquated character which one would hardly look for in a modern work.

Mr. Sturgis covers in this volume the history of the architecture of antiquity in Egypt, Western Asia, Greece and Rome, in an easy, familiar, often discursive and almost conversational style, occasionally entering into extended discussion of details which many might consider of secondary importance. The plan of the work seems somewhat lacking in system and coherence; it is neither strictly chronological nor strictly analytic and topical, nor does it combine the two systems upon any recognizable principle. It is rather a series of essays on various phases of antique architecture, grouped by countries and large periods than a systematic history of the art. It fails to present a clear and coherent picture of the advance of the art of building and of the gradual evolution of the various styles. One perceives everywhere the analytical rather than the historical spirit. Yet the work is far from being unscholarly. It gives evidence thruout not only of wide reading, but also of that peculiar erudition which comes from a lifelong enthusiasm for and absorption in a subject of study. On matters of controversy Mr. Sturgis often takes the judicial attitude of suspended judgment, and is rarely, if ever, dogmatic. In matters of appreciation he shows the independence of a thorolytrained critic who knows what he is writing about, and will doubtless carry his readers generally with him. There will be, however, an increasing number to protest against his summary denial of the quality of originality to Roman architecture (p. 385). The art of monumental planning of complex buildings originated with the Roman builders, and they are entitled to credit for this as well as for being the first to conceive the superb effect of spacious and lofty interiors unencumbered by supports. It is a little discouraging that a work coming out under the authority of so distinguished a writer should in any degree echo the uncritical verdict of the writers of fifty years ago, who condemned everything in Roman architecture because it was not Greek, while they found fault with its lack of originality because it was all borrowed from the Greek!

The nomenclature of places is occasionally open to criticism. For Pæstum and Selinus—long accepted forms in English—we have Pesto and Selinunte; on different pages the same place is called Akragas, Agrigentum and Girgenti. But these and occasional misprints, like B. C. for A. D. on page 52, are rare and minor defects in a book full of information and suggestion, the fruits of a ripe scholarship, and far more readable than most works of this kind are apt to be. The two remaining volumes of the proposed history will be awaited with interest.

* A History of Architecture. *By Russell Sturgis.* Vol. I, Antiquity. New York: The Baker & Taylor Co. 8vo, xxvi, 425. $5.00.

Lord Acton and His Circle

The letters of Lord Acton which make up this sturdy volume* belong chiefly to the period between 1858 and 1864; that is to say, between Acton's twenty-fourth and thirtieth year. They are nearly all preoccupied with Acton's three or four ventures in Catholic magazine editing, and are addressed to Richard Simpson, the acting editor of the *Rambler* and the *Home and Foreign Review.* It is to be expected, therefore, that these letters will be of a different tone from those written

* Lord Acton and His Circle. Edited by Abbot Gasquet, O. S. B. New York: Longmans, Green & Co. $4.50.

twenty years later to Mary Gladstone, and edited for us not long ago by Mr. Herbert Paul. This later series, as the readers of it will remember, bears on many a page traces of the bitterness and discouragement with which Acton emerged from the dark days of the Vatican Council. For altho, unlike his great teacher, Döllinger, he never left the Church, still for the rest of his life he was in a state of constant temper against Popes, Curia, Index Inquisition and Society of Jesus. Of this, however, there is scarcely anything in this volume. A few letters at the end, it is true, dated after the Vatican Council, tell of Manning's pressure upon Acton in order to get from him a profession of faith in the Vatican definition; a demand which Acton was in no hurry to comply with, since Manning was not his bishop and had but a questionable canonical right to hold him up in such a fashion.

The bulk of these letters, as we have intimated, are communications to Simpson on the contents and character of the *Rambler,* and later, of the *Home and Foreign Review.* They display the shy and modest Acton in those intimate moods which are so apt to illustrate a man's qualities of heart and head. They particularly reveal to us, as the letters to Mary Gladstone did, Acton's enormous historical learning, which, despite its massiveness, he held in easy, almost jaunty control, so that erudition flowed into his letters as copiously as the higher gossip of the day.

But the main interest of these letters is in the light they throw upon English Catholicism during the fifteen years which followed the Oxford movement. This Dom Gasquet has admirably brought out in his splendid introduction. The Oxford and Cambridge converts of those days were taken aback by the low state of education which they found among the born Catholics. W. G. Ward, violent Ultramontane as he was, said that the philosophy taught in Catholic colleges debauches the minds of the students. Newman, so sparing in words of censure, deplores the blindness and ignorance of the Italian theologians. In similar tone spoke Simpson, Capes, Stokes and many others, to the grievous hurt of old-fashioned Catholics, and quite to the scandal of men like Faber, who had become not only Catholic, but Italians. The liberal view, of course, predominated in the *Rambler* and in its successor, the *Home and Foreign Review,* and liberal these magazines remained while they existed, despite many protestations from high quarters. Finally, when Pius IX. wrote his celebrated brief to the Archbishop of Munich in 1863, in which he so strongly denounced liberalism, and stated that good Catholics should submit, not only to defined dogma, but also to received theological opinions and to the decisions of Roman Congregations, Acton and Simpson put an end to the *Home and Foreign Review,* saying that they felt in conscience constrained to this action by the words of the Pope. As Liberal Catholicism is again a burning question, this feature of these letters makes them timely in a notable degree.

Federal Power Over Carriers and Corporations

Mr. Prentice's book on *The Federal Power Over Carriers and Corporations,** is a vigorous protest against the present tendency toward centralization of power in Congress, especially as a remedy for the evils arising from the increase in size and power to stifle competition of corporations engaged as carriers or otherwise in interstate commerce. The work as the author says in his preface, deals with the nature and extent of the powers belonging to the general Government and is not concerned with Congressional legislation except in so far as the Sherman Anti-Trust act bears on the general subject. Its keynote is a contention against the further extension of the powers of Congress by interpretation of the interstate commerce clause of the Constitution so as to deprive the several States of their constitutional right to create and control corporations and individuals engaged in inter-State commerce, the exercise of which right is asserted to be sufficient to avoid and prevent the evils of which complaint is made. Apart from its interest to the lawyer and

* The Federal Power Over Carriers and Corporations. *By E. Parmalee Prentice.* New York. The Macmillan Co.

the lawmaker, the book is of value to all who are concerned with or are interested in the problems of Government and economics.

Premising that the Constitution is a historical document, the meaning and interpretation of which should be determined by the study of the contemporaneous conditions and of the constitutional practice of the States and of Congress, the author devotes a considerable part of the work to considering the proceeding in the constitutional convention in relation to the so-called commerce clause. From such investigation of the history of the Constitution, the author concludes the purpose of the commerce clause to be threefold; to regulate foreign commerce, as to which Congress was given absolutely exclusive power; to regulate commerce with the Indian tribes, as to which the powers of Congress could not in any way be entrenched upon by the States; and finally to regulate interstate commerce, by which, it is declared, it was intended to grant to Congress exclusive power solely over coastwise trade and to prevent restraints by the States on commerce and intercourse among themselves.

Passing from the question of the extent of the power to regulate interstate commerce as historically developed prior to and shortly after the adoption of the Constitution, the author takes up the enlargement of this power thru the decisions of the Supreme Court interpretating the clause in question, which, starting with the decision in Gibbons vs. Ogden and culminating in the decision in Cooley vs. The Port Wardens, have established the doctrine, now safe against attack, that the power of Congress under the Constitution over interstate commerce of every nature is exclusive in all matters which require uniformity among the States, and as to others of local importance is exclusive only when Congress has legislated on the subject. Mr. Prentice concludes that while the doctrine just stated is, perhaps, the most satisfactory solution of the question that has ever been given, it has brought with it difficulties, and is not only a departure from the intention of the Constitution, but a departure from legal principles which opened the way for further extension of Federal power under the commerce clause, and especially of the Federal power over land carriers.

The next subject discussed is the right of Congress to create and charter corporations. Mr. Prentice forcibly denies the existence in Congress of the power which it is now frequently asserted to have under the commerce clause, to forbid corporations engaging in interstate carriage and commerce without the grant of a charter from the Federal Government involving submission to regulations imposed by the charter or by other Congressional legislation. He holds that Congress under the Constitution and decisions of the Supreme Court has absolutely no authority to create corporations except as incident to the carrying out of one or more of the great powers given to it by the Constitution, and he asserts that the creation of corporations for the purpose of engaging in interstate commerce can in no way be regarded as a necessary and proper or an implied power incident to the carrying out of the powers of Congress under the commerce clause.

The work is concluded by a thoro consideration of the Sherman Anti-Trust act, the constitutional principles involved therein and the decisions of the court thereunder. Mr. Prentice laments the present tendency of the courts under the Sherman Anti-Trust act to extend the prohibition of the act beyond combinations or contracts in restraint of interstate trade to mere combinations or contracts to manufacture within a single State merchandise which may become the subject of interstate transportation or commerce, and he asserts that the courts in so doing have looked more to the size of the corporation and of its business than to whether or not the contract or combination involves interstate commerce, on which ground only has Congress power so to legislate. He concludes that among the matters left to the States by the Constitution was the entire subject of corporations, and asserts that the courts in construing the Sherman act have gone to the verge of Federal jurisdiction, and that an extension of the present doctrine could be made only by the sacrifice of State authority and by overturning long-established principles of Constitutional law.

Lincoln the Lawyer. By Frederick Trevor Hill. New York: The Century Co., $2.00.

Mr. Hill has done the public and the profession a favor in showing how it came about that Mr. Lincoln was one of the great lawyers of the country. The prevailing idea has been that it was due to chance genius, and was a sort of fluke. Nicolay and Hay even had not dispelled this view. It was due to fitness and work. Lincoln's methods, his life, his environment, his character are adequately shown. Externally Lincoln was a lawyer without system, but his cases were thought out and studied out and the law was sounded in behalf of his clients. He mastered the salient features and presented his evidence and arguments with such tact and clearness, winning at once his case and the friendship of his hearers, that, after years of both office and court work — for his professional life was odd thirty years in length—from a trial lawyer he became a counsel, a barrister, as the English have it. He tried no less than a hundred and seventy-three cases in the Illinois Supreme Court, a vast record for any lawyer, and they comprehended all branches of the law, so it was no mild apprenticeship that wrought the man who surprised the nation in the Cooper Union speech, and revealed a new defender of the Constitution. Many are the good stories that Mr. Hill has gathered in this demonstration. For that old circuit system of our earlier days was full of humorous situations. This system, whereby the court, attended by the advocates, traveled like a caravan from county to county, dispensing justice as it went, has been illustrated from a fine example by Mr. Hill. Judges and lawyers of the first rank and cases of great importance were in the old Eighth Circuit, and it matters not that the jury were sometimes literally dragged to their duty by the sheriff, or that his Honor sometimes physically chastised a disturber in demonstrating the dignity of the law. The circuit was a great one. The sturdy manliness of Lincoln's character colors the history. He was as a lawyer what he was as a man, ever warring for the right, securing justice and resorting to no tricks or subterfuge. An evil case he would not touch, and he even abandoned those that developed the dishonor of his client. "The fairest lawyer I ever knew," said old Judge Breese, of Illinois, who had known him for a quarter century, "and of a professional bearing so high-toned and honorable as justly and without derogating from the claims of others, entitling him to be presented to the profession as a model well worthy of the closest imitation." And this Mr. Hill shows to our thoughtful pleasure and satisfaction.

A History of Southern Literature. By Carl Holliday. New York and Washington: Neale Publishing Co. $2.50.

The author claims in his preface to this large, fine-looking volume that it is his purpose "to make a study of the various literary movements and their results and show that the writings of this section (the South) are not mere disconnected efforts of isolated thinkers, but rather the natural, logical and continuous productions of a people differing so materially in views and sentiments from their neighbors of the North that even the Civil War was necessary to prevent their becoming separate nations." In a purpose so laudable we could wish that he had succeeded better; but the book is not a contribution of original or permanent value to the subject discussed. Not to mince words, it contains 400 pages of elegantly printed platitudes, and little else except an occasional quotation. Apparently, however, the author has been industrious in the collection and careful in the verification of his data, and his work, with its good index and bibliography, should make an excellent reference book for mere facts.

Merrylips. By Beulah Marie Dix. New York: Macmillan Co. $1.50.

Merrylips was the youngest child of Sir Thomas Verner, a bluff English gentleman. She had a godmother who wore coffers of jewels hidden in her clothes, and she had everything else to make her life a wonder to every other little girl who reads the book. For one thing, she wore boy's clothes, and was snatched from loyalists to Roundheads and back again during those perilous days when the King and Parliament failed to agree. Her adventures in and

between the lines among the rough, hearty soldiers who believed her to be a boy make up the tale, which is sufficiently charming and incredible to please any child, but especially girls. The author, indeed, has very appropriately dedicated it "To every little girl who has wished for an hour to be a little boy."

Literary Notes

....According to the reports received from a gross of circulating libraries, the *Literarische Echo* gives the following as the most popular books of the year in Germany: *Hiligenlei,* by Frenssen; *Einer Mutter Sohn,* by Viebig; *Tagebuch einer Verlorenen,* by Böhme; *Die Wiskottens,* by Herzog; *Der Wetterwart,* by Heer, and *Götz Krafft,* by Stilbauer.

....*Predecessors of Cleopatra,* by Leigh North, is a diligent compilation of what is known of the Queens of Egypt for four thousand years of its history. The author has collected interesting material about these mummified ladies from many sources, but he does not indicate what these are, nor does he handle his material critically. [Broadway Publishing Co., N. Y.]

....The voyage of our Secretary of State around South America forms an important part of our diplomatic history, and the speeches made by Mr. Root, as well as those made to him by the public men of the countries visited cannot be neglected by the student of our relations with Latin America. It is, therefore, fortunate that the Government Printing Office has published all these speeches in book form.

....The first number of the *Journal of American History,* produced by the Associated Publishers of American Records, New Haven, is somewhat bewildering in its typographical effect because of the extensive use of Old English lettering, colored flags, *facsimile* autographs and seals, gilded titles and triangular headings. In variety of contents it is equally perplexing. It deals with the past, present and future of America, for it contains historic documents, selections from contemporary editorials, and prophecies from Western Governors.

....The little volume entitled *Walks and Words of Jesus* is a reversion to the primitive form of the Gospel narrative. Rev. M. N. Olmstead has selected the quoted words of Jesus from all sources, and printed them by themselves, with brief connecting passages. It is, of course, uncritical to assume that the literal quotations, and especially those from Revelation, give any more accurately the words of Jesus than the indirect discourse, but the separation brings out many interesting points commonly overlooked. All the fragmentary logia recently discovered at Oxyrhynchus are included. [Published by G. Mortimer McClintock, Newark, N. J. $1.50.]

Pebbles

"THIS is a very tight fit," quoth Senator Murphy, as he went into delirium tremens. —*Cornell Widow.*

"Do you belong to the Law and Order Society?"

"Yes; anybody you want lynched?"—*Atlanta Constitution.*

"JOHN," said Mrs. Smithers, "you asked me to read the President's Message, and I did."

"What did you think of it?"

"To tell the truth, I was disappointed. I had hoped to find in it somewhere a hint as to how to have my brown velvet made up."—*Philadelphia Ledger.*

Uncle Nehemiah, the proprietor of a ramshackle little hotel in Mobile, was aghast at finding a newly arrived guest with his arm around his daughter's waist.

"Mandy, tell that niggah to take his ahm from around yo' wais'," he indignantly commanded.

"Tell him you'self," said Amanda. "He's a puffect stranger to me."—*Lippincott's Magazine.*

BARONESS BURDETTE-COUTTS, the richest woman in England, who died yesteday at the age of ninety-two, did a funny thing a few years ago. She heard an American boy named Willie Bartlett recite "Hiawatha," and was so taken by his elocution that she married him, though older than his grandmother. This is the only instance on record where elocution ever paid.—*Atchison Globe.*

A YOUNG reporter was given an assignment to write the obituary of a prominent Western pioneer. He wrote as follows:

"Citizens of this State will be very much grieved to learn that Uncle Joseph Hawley has been gathered to his fathers. He had been confined to his bed for three months with a serious ailment, and while hope was entertained that he would recover, his death was not altogether unexpected. Thus is another well-known pioneer the victim of the grim reaper, and another sturdy spirit has crossed the range."

The city editor remonstrated, with more than ordinary patience, "You better write this over again, my boy," he said. "Don't use so many old expressions. Try to keep everything new and up-to-date. Don't use so many hackneyed phrases. Originality is what we want." The young reporter seized upon his task with avidity. Presently he approached the city editor's desk and breathlessly laid his second effort upon it. This is what he had written:

"Everybody will shed tears when they hear that 'Josh' Hawley has joined his ancestors. He has been about all in for nearly three months, and while a good many people kept kidding themselves with the idea that he would get well, it was a cinch he had to go.

"Thus is another of the old boys mowed down, and another soul has bored a tunnel through the great divide."—*Puck.*

Editorials

Mr. Shonts and Mr. Wallace

THE withdrawal of Chairman Shonts from the service of the Government closely resembles the departure of Engineer Wallace, a year and a half ago, altho the resigning Chairman does not appear to think so, and the similarity seems not to have been discovered by the President or Secretary Taft.

In his memorable interview with Mr. Wallace, the Secretary remarked with considerable emphasis that the Engineer was changing his position "for mere lucre" and "personal advantage," and that his course was at variance with "every principle of honor and duty." Mr. Wallace desired to accept a place in which he would receive a much larger salary, but it was his purpose to remain for a time in the service of the Government, in order that the transfer to his successor might be made without difficulty. His responsibility was not so great as that of the Chairman, who has held, as the President said in his letter of the 22d inst., a "vitally responsible position."

Mr. Shonts (who has said that he never censured the Engineer for his action) also leaves the service for "personal advantage" and probably "for mere lucre." His new salary is to be very much larger than his old one. He has held his "vitally responsible" office only twenty months. He explains that he "never contemplated the supervision of construction" on the Isthmus. We are not informed whether it was known to the President and Secretary Taft that he became Chairman with that understanding.

He says that his "duty ended when the work was so organized that nothing remained to be done except the execution of a contract." But no contract has been executed, and at last reports there was no contract in sight. The lowest bid has been rejected; the next one is too high. And even after the making of a contract, much will "remain to be done" on the Isthmus. Even now, a final decision may not have been reached as to questions of great importance concerning the type of canal and the projects which are essential to the lock plan.

One would think that the departure of the "vitally responsible" head of the whole organization at this time must not be less embarrassing and disturbing than Engineer Wallace's withdrawal a year and a half ago. We are not saying that MR. Shonts has been disloyal or has not acted within the limit of his rights. We are only making such a comparison of the two cases as is suggested by the attitude of the Government toward the two retiring officers. The remarkably harsh treatment of Mr. Wallace was approved by the President, who now releases Mr. Shonts with the most complimentary expressions of affectionate regard. If Mr. Wallace had gone to the Chairman for instruction, he might have learned how to resign without having the door slammed in his face.

Concerning Depravity

MORE significant than public protests against the performance of the play "John the Baptist" and the opera "Salome" has been the quiet discountenancing of these offenses by thousands of persons who would enjoy the acting of Marlowe and Sothern, or who would have been glad to get their own impressions of the most ambitious musical creations of Richard Strauss. It is these people, who say little, but who manifest their principles in their conduct, who constitute the real conscience of a community.

The argument that art must live by its own canons, and not by those of an imposed morality, is entirely sound. No moralist whose code has been framed in breadth of knowledge and in philosophic insight will dispute the artistic position. But between a morality that is thus broadly based and artistic canons that are true to esthetic principles there is no conflict. The subject matter of art is beauty in some one or more of its infinite modes or moods. Depravity is not beautiful. That which is disgusting morally is not attractive esthetically. It never was. It never can be.

It is true that a raw civilization does not always accurately discriminate between depravity and some other things. Nice discrimination comes only with a rather high intellectual evolution, supplemented by much experience of life. Unformed communities, unacquainted with the great creations of art and literature, not infrequently mistake the unconventional for the depraved. The note of unmistakable depravity is always to be found in the unnatural or the degenerate. That which is itself natural may become unnatural when displayed, and provoker of vice. Yet the natural, even when it is coarse-fibered, may be an element in sound esthetic composition. The natural may be terrible; it may be tragic; but not loathsome.

It is one of the hopeful indications of American life that, without any general development of that pruriency which has marked too many civilizations of the past, we are acquiring thru the spread of scientific knowledge a sane understanding of what constitutes naturalness, and, by contrast, of what constitutes its opposites, unnaturalness and degeneration. Any normal function of the living organism is as natural as the play of sunlight or the beating of the tides, but it is equally natural that certain ones should seek the cover of clothing or concealment. The natural may run into excess; it may fall into the vice of intemperance; it may be inadequately controlled by the social feeling, and thus subject itself to those restraints which are necessary to insure the common good. But the natural in and of itself cannot in the slightest degree become depravity.

It is when this sure foundation of sane ethics is clearly perceived by a community that the duty becomes absolutely clear to bring all the forces of healthy sentiment and sane public opinion to bear against the public exhibition and commercial exploitation of depravity. It is only a degenerate mind, expressive of an exhausted physical vitality, that can take morbid pleasure in a display of horrible frenzies of unnatural passion. Art may bring all its resources to bear in depicting the pathological, but it cannot make the pathological in any true sense of the word beautiful. It cannot in such creations be true to itself. By suggestion and a subtle disintegration of conscious self-control, it can easily impair, at one and the same moment, the power of men and women to resist physical breakup and their sensitive responsiveness to normal, fine, healthful stimulation.

We need have no fear of any art which depicts life in all the vigor and the beauty that nature strives ever to attain. That which nature makes in her creative efforts is sound, virile, admirable. But that which is born of mental and physical decay, of disintegration, that which marks degeneration and the road to death, cannot be portrayed without placing the seal of death upon art itself, as surely as upon human character. For fine and beauty-loving minds, as for sane and healthy minds, there can be but one rule in these matters: Leave the dying to revel in death, and the dead to bury their dead.

That Iowa Lynching

THAT Iowa lynching was at Charles City, a town of about 5,000 people, and not at Waterloo, a city of 20,000 inhabitants. The occasion of this horrible and disgraceful affair teaches an old lesson of the perversities of legal practice, which are of advantage to tricky lawyers, but not to the people.

Cullen, the victim of the mob, had lived many years in Charles City, was well known as a contracting carpenter of considerable means. The place was small enough, so that the people generally were acquainted with him and his family, their characteristics and the story of the case. Busse, another wife murderer in the adjoining county, whose sentence had been that week commuted from death to life imprisonment, was also known to the people of Charles City. His crime, like Cullen's, was accompanied by revolting circumstances, extending it beyond uxoricide. In the "quest for error" his lawyers succeeded in securing different reprieves from the death sentence, and finally, in the review of the Supreme Court of Iowa, four of these eight judges had held that he was technically entitled to a new trial. This in spite of his unquestioned guilt and confession. Cullen had been a close

follower of these proceedings, and when the Governor during the same week had commuted Busse's sentence to life imprisonment, remarked: "If they can't hang Busse they can't hang any one." He sent for his brother in Illinois to come to him, got up in the morning, killed his wife and tried to kill his stepson, fifteen years old, and finally shot the boy in the back, killing him when he started to bring the officers. It looked like a premeditated and planned crime. He was lynched that night.

The horror and the shame to Iowa because of the lynching should not obscure the real occasion behind it. The lynching was a passionate protest against the befogging precedent which seems to entangle the legal mind, and makes the *form* of more importance than the substance of justice in the eyes of the lawyers and of the courts.

The natural thought of the people was that Cullen, too, with his money, would escape the penalty as Busse had. He was guilty enough, but legal sophistries, woven by tricky lawyers, hired to obstruct justice, would entangle the prosecution and trial judge in error. Then the Supreme Court would find the flaw the defense had so skilfully got into the record and the criminal would escape.

Our legislators are largely lawyers and do not seem willing to simplify proceedings. They say: "Lawyers are entitled to a living." But the public is entitled to consideration, and this lynching was a yell of rage from an exasperated community, which is liable to be heard again unless the demand of the people for legal reform is satisfied by those in authority.

President Andrew D. White, in his autobiography, makes this comment:

> "I have long felt and still feel that of all the weaknesses in our institutions one of the most serious is our laxity in the administration of the criminal law. No other civilized country, save possibly the lower parts of Italy and Sicily, shows anything to approach the number of unpunished homicides in proportion to the population which are committed in sundry parts of our own country, and indeed, in our country taken as a whole. In no country is the deterrent effect of punishment so vitiated by delay. In no country is so much facility given to chicanery, to futile appeals, and to every possible means of clearing men from the due penalty of high crime, and especially the crime of murder."

Dr. Richards on the Apostles' Creed

Dr. William R. Richards, pastor of the Brick Presbyterian Church of this city and successor of Maltbie D. Babcock and Henry van Dyke, has issued a book on the Apostles' Creed which is in effect a brief in favor of the introduction of that ancient symbol into the worship of non-liturgical churches. Dr. Richards was a member of the General Assembly's Committee which prepared the "Book of Common Worship," in which the Apostles' Creed is made a part of the Order of Morning Service. His book, therefore, may be taken as an authoritative statement of the reasons which impelled Dr. van Dyke's committee to recommend the inclusion of the creed in Presbyterian worship.

Dr. Richards has put together in admirable form about all that can be said in favor of congregational use of this ancient confession of faith. He finds that it answers the pious longing for "some great hymn of the Church (to be said, not sung, for not all can sing), a hymn hallowed by age, and still the vehicle of man's present and living convictions, thru which we all, adding our voices to the countless hosts of those who have gone before, might gratefully speak out our confessions to the world." It falls pleasantly upon his ear, "like the echo of a vanished world." It seems to him to embody the essential faith of earnest living disciples, with marvelous exactness, laying the emphasis on devotion to the Founder of the faith, precisely where progressive theology is inclined also to bestow the stress. While more elaborate creeds, like the Thirty-nine Articles and the Westminster Confession, tho entrenched in the constitutions of great Churches, have been much spoken against, the briefest and most ancient symbol has increased in favor. Dr. Richards is aware of objections to its use, but he imputes them chiefly to misunderstandings, and declares that other considerations against its adoption in worship are so unimportant as to be negligible.

There are, however, very serious difficulties in the way of congregational

use of the Apostles' Creed, and in our judgment a denomination or a particular church not already saddled with it may make a serious tactical blunder in introducing it into its liturgy. A church should be very careful as to what it puts into its worship. A new confession of faith, short or long, is adopted by divines and soon goes to the shelf, but a habit of worship comes to the front every Sunday and establishes the standard of belief. Dr. Crapsey was forced from the Episcopal Church, not because his doctrine did not square with the Thirty-nine Articles, but because his belief did not appear to be a fair interpretation of the liturgy. Now the liturgical practice advocated by Dr. Richards has a bad savor at the outset because of the falsehood in its name. It may perhaps be explained that the story of its composition by the Twelve Apostles, each contributing a clause, is a mere legend, but the impression abides that the symbol declares the faith of the Apostles, even tho it was not composed until several hundred years after the last Apostle was dead. Dr. Richards evidently believes that in expounding this creed he is expounding Apostolic Christianity. Yet it may be confidently asserted that this symbol contains not a single one of the great ideas which Jesus preached and for which he gave his life. Not one of his burning convictions on moral and religious truths is even suggested. On the other hand, the God of the Apostles' Creed is not the equal Father of all, but the first Person of the Trinity, the Maker of heaven and earth. The Christ it declares was conceived by the Holy Ghost, born of the Virgin Mary, and descended into hell—three matters on which the lips of Jesus were never opened. The creed is as far removed from the doctrine of Paul as from the Galilean gospel. It reflects neither Paul's enthusiam of liberty nor his sense of redemption and new life in Christ.

It is not true that the Apostles' Creed is a fair statement of ordinary Christian belief at the present day. To begin with, three of its clauses, viz., the descent into hell, the holy Catholic Church, and the resurrection of the body, require to be very much explained away and deprived of their original and proper meaning before they are at all acceptable to the average Protestant congregation. An increasing number, in the Church as well as out of it, do not believe in the literal virgin birth of Jesus. It may be that these doubters are sadly in error, but the point is that they are numerous and likely to be more so, and it ought not to be made hard for them to worship God honestly.

Mr. R. H. Hutton used to say that reciting the Creed was not actually a statement of conviction, but "an act of intellectual adoration," "a solemn act of spiritual survey over the foundations of faith." He declared that "it fortifies the soul to remember facts on which Christianity has been based, even when one doubts them." But surely it is a poor sort of fortification to one's religious faith to say things he does not believe. To such a pass have defenders of this Creed been put almost within our generation. There was some excuse for these apologists, for to them the Creed was part of an ancient and beautiful liturgy, to which the heart clung tenderly. But there is no such excuse for American non-liturgical churches, and it would seem a blunder of the worst sort for any religious body to load itself with a burden which their brethren in England and Germany have found very grievous to bear.

Why should men of progressive spirit, who are certainly cognizant of the distresses caused by authoritative creeds, endeavor to bring in creedal restraint where now is liberty? Do they honestly think that souls will be comforted and men strengthened in honesty and uprightness by the repetition of this Creed? We gravely doubt it. The real reason is desire for more liturgy, ambition to heal Puritan worship of its bareness and the wish to restrain members from receding to churches where the "service is more beautiful." The innovation is not of necessity condemned because this is its motive, but for so small a gain to risk the alienation of an increasing number of conscientious men is not the part of wisdom. The men most needed in the churches are those who will not "fortify their soul" on what they do not believe, even tho it sounds pleasant to the ear. The Apostles' Creed contains

dogmas not essential to Christianity, which are destined to be subjects of controversy for many years. Men are likely to be sharply divided, and many whose hearts are Christian will certainly be found on the side which rejects the creedal statements. In the face of this certain fact it were wise for churches to let the Apostles' Creed as nearly alone as they can, and coquet with ritualism in some other way.

A Basket of Apples

If you are not so situated that you can lay down your pen, with a clean conscience and quiet nerves, just half an hour before dinner (the old-fashioned dinner at noon), pull a basket full of apples between your legs, looking critically down into the contents (a full peck), enjoy the color, the shape, the smoothness and the aroma; let memory play about suggestively thru the history of the dozen varieties smiling up at you invitingly, recalling your boyhood climbs among the branches of the old family orchard; then draw your pocket-knife out of your right pocket, deliberately; begin to eat, comparatively, five or six apples; all the time studying, thinking and rejoicing underneath the vest; dropping the pretty peelings into your waste basket, and careful to lose as little as possible of the crystal white cells—why, if all this *is* impossible with you, you are to be pitied. The country editor takes it that this is the one emotion—rather multifold, perhaps—that comes nearest to being a poem without words, of which the human being is capable. It should be undisturbed, unhurried and solitary—unless, possibly, Frank Brown the Senior happens to be in; he who was born in an orchard, and bred among the apple-bins, so that now his apple judgment is unimpeachable. He assures us that the Falernian wine of Horace was nothing in the world but Spitzenburg cider.

But, with the basket between your knees, you must learn to lift each apple deliberately, roll it over between your two hands tenderly, getting first of all the feel of it; then you will hold it up cheeringly before your eyes, admiring the rich gold, the crimson stripes, the innumerable dots of silver, the open basin, artistically carved and touched with russet brown, the stem set in coquettishly at the top. Bless us, was anything ever so exquisite as a perfect apple! Then you hold it to your nose, until the perfume closes your eyes, and you lean back in your chair, recognizing to the full the fellowship that exists between all good things in Nature. No wonder that tradition makes this to be the forbidden fruit, growing in the very center of the Garden of Eden. If indeed it was, then Eve was excusable, from the modern standpoint, for her trespass. Yet we cannot see why a Northern Spy should have made so much trouble.

We have already tasted one Maiden's Blush, one Dominie, one Nonsuch, one Seeknofurther, one Golden Pippin, one Princess Louise, and are nearly ready for dinner. The uneaten sections of our apples are laid away delicately, for further comparison. Each sort has its own fragrance, its own texture, and its own flavor, as well as its own color. We have no friendship for those to whom an apple is just an apple, and nothing more; who bite carelessly and devour thoughtlessly, without rhythm or soul response. A true boy whistles between apples; a true man is wrapt in meditation. This basket of apples is the hight of evolution in the vegetable kingdom, as man is its crown in the animal kingdom, and so there is something of equality between us. You suggest the rose, but an apple tree in blossom surpasses a rose bush as a mountain surpasses a mound; and then you must not forget that the rose is cousin of the apple. In this basket is the struggle of centuries, the survival of the fittest. In the animal line Nature was compelled to allow apes before she could evolve man, but in the vegetable kingdom she reveled for a long time in sweetbriars and rosebuds and strawberries, on the way to the apple.

The country editor is not selfish. He cheerfully invites his friends of the INDEPENDENT family to reach out a hand and help themselves. Nature does the same thing, with the same restrictions and qualifications. Go into some shaded valley, where the west winds are broken by beautiful hills; select a sloping lawn, and plant for yourselves an orchard. This is the best dream of boyhood, and it is

the best realization of manhood—life in an apple orchard. In spring the generous perfume of the trees, surcharged with the finest ozone ever brewed; in midsummer growth, growth, and ever-unfolding buds and twigs; in autumn a blaze of color, a brew of cider, the joy of a basket of apples. It is impossible any longer to be satisfied with a single variety. Nature could not get all her fine thoughts under the skin of a Seeknofurther, or an Albemarle pippin, or a Rhode Island greening. When she created the apple she produced such a profusion of goodness and wisdom that a thousand Burbanks cannot develop the whole of it. A new apple, with a new flavor, comes about once a year. We shall always approach, but never quite reach the perfect apple. Yet, indeed, we have almost tasted that very thing, this very noon.

You never knew a happier debating club, or a pleasanter debate, than that of a group of horticultural friends over a basket of apples. Each one has his favorite, or favorites, rather. Professor Johnson is sure that Scott's Red Winter, with its melting flesh and exquisite flavor, is best of all; but Woodland Owen warmly defends the dear old yellow Belle Fleur; while the ladies are divided between Waxen, Lord Nelson and Maiden's Blush. Their basket at last stands dismally empty in the middle of the group, and nothing is left but twelve plates of fragments. Yet there is a smiling satisfaction all about the circle, and a conviction that the apple is the most beautiful, most wholesome, most delicious of fruits. We also are convinced that it conduces to health and happiness. Its acid goes counter to the poisons bred by a coarser diet. And then how sweetly Nature has adorned her table! Eating, with her, is not an animal function. Nor have we smelled the unctuous fats of cooking. We have enjoyed ourselves artistically, poetically, morally, and are a better man for the basket of apples.

The Bad British Colonial System

A COMMITTEE of the native Zulus of Natal, men of property and education, have presented to the Commission on Native Affairs their requests or demands, as published in one of their newspapers, the *Hlangalase Natal*. These natives, who have held the territory from time immemorial, ask the right to buy land, horses and guns; the right of public meeting; a change in the hut-tax, and representation in the Colonial Parliament by two or three whites elected by their chiefs and such natives as can read and write. This seems most reasonable.

Such a request throws a clear light on the contrast between the English and the American way of treating a colony. It is our idea to lift the people as fast as possible into the condition of a self-governing state. It is the British idea to keep the natives under strict rule, as being incapable of reaching self-government.

Natal affords a sad illustration of this ungenerous British policy, which has resulted in vengeance and massacre; and can, in the end, result only in bitter and savage rebellion, as has lately been seen in German West Africa.

It is not at all unlikely that the Zulu outbreak in Natal is a part of the unhappy fruit of education, in which American missions have had a principal part. The missionaries, Grouts and Linsleys, gave the language a written form many years ago, translated the Bible into Zulu, established schools, and did what always results in inspiring ambition for progress, and an understanding of the people's rights and their wrongs. At last the time came when the whole people, Christian and pagan, began to ask their rights and to resent oppression by a small minority of white settlers who claimed to rule their land. As in Japan and China, they wished to rule in their own churches, and the Congregational way in which they had been trained did not discourage this desire. The missionaries established many churches in outstations and ordained native pastors. Meanwhile, our African Methodists sent their missionaries and gathered not a few of the converts into their churches, entirely under negro management.

Now, the Anglo-Saxon rulers in the East have no sympathy with that sort of growing independence. They would have the native in India or Africa taught to believe himself an inferior, to be reduced to subordination. If he does not

hasten to get out of the way of a white man, kick him or whip him.

Until the Boer War the British Colonial Government had always been friendly to the American missionaries. But after that war, the ruling class began to fear the growing independence of the natives, and determined that it must be suppressed. Hostility was directed particularly against the missions of the American Board. First native ministers of that mission were refused permission to perform the marriage service. In reply to protests, they were told that the authorities did not like their form of Church government. A native, they said, should not be taught to have any authority in his own church. A church council lately chose a native as moderator, and this gave great offense.

Then followed an edict directed at all the missions, that there should be no church erected or native minister placed in charge on native reservations, except as a white missionary is resident to keep him in proper subjection; and they gave orders that several such churches should be pulled down, and two were torn to the ground. In a third case a native pagan chief interfered and prevented a Government of Christian white men from tearing down a Christian church.

Then came a measure more serious in its effects. There had been large reserves granted to the missions for the use of the natives, and they had built civilized houses and cultivated their farms. Later the Government threatened to take the lands and sell them to white men, but finally consented to become itself trustee for these reserve lands. When now the Zulus wanted to buy their own houses and farms, the Government refused. This made a very bad feeling, which was increased when the Government put a tax of fifteen dollars on every Zulu house or hut, the purpose being to compel the natives to accept employment in the gold and diamond mines. It is an enormous sum for any native to pay, and the attempt to collect it caused the late bitter rebellion. In addition, a poll tax of five dollars was put on every able-bodied native male of full age. It is an outrageous and oppressive tax, and considering that the people are allowed no representation and are by nature an independent people, it is not strange that they have felt resentful and disloyal.

Doubtless American ideas have indirectly had something to do with the late uprising; but it is to be noted that none of the converts took part in the insurrection, altho their wrongs were even greater than those of other natives. But they had more intelligence and understood the folly of resistance. It is amazing that a ruling caste do not understand that the way to get the good will of a belated race is to help it, to lift it up, and encourage every step of progress of which it is capable. We think that our American churches, which have developed these missions and elevated these people, have the right to protest to British Christians against this inhuman system of colonial rule.

Social Industrialism

One of the most interesting features of increased industrialism is its effect upon the classes which have heretofore scorned work. Gentility and gentle methods of living are more or less discounted. Mr. Bryan, in one of his recent addresses, insists that the American school system is developing a self-sustaining power of the race. He did not argue that our colleges were turning out graduates anxious for manual employment, but that the common schools of the country were closely affiliated with labor. We believe there is a perceptible increase of honor paid to direct and personal hard work. There is less respect and special honor paid to the professions. Wealth is by no means as anxious to keep its skirts clear of the dust of toil. The drift countryward from our cities is closely associated with a desire for gardening and land tillage.

In England we have a long list of nobility associated with industrial enterprises. The Duchess of Abercorn runs a dairy, and supplies the leading milk dealers of Belfast. Lady Essex and Mrs. Williams conduct a laundry. Lady Duff-Gordon is a dressmaker. The daughter of Lord Strafford keeps a shop for artistic needlework. Miss Frances, the daughter of Lord Wolseley, sustains a school for gardening, and manages a garden herself. The niece of

Lord Dormer is a milliner. Lord Pembroke runs a carpet factory, and Lord Harrington keeps a fruit shop. In Holland we find Queen Wilhelmina adds to her pin money by a profitable milk and butter business; while Emperor William of Germany competes openly in the brick-making business. Some of his brick-making subjects do not like his competition, for he is able to set the price for the whole market.

We believe that Mr. Bryan is right, that in this country the drift is very strong toward industrialism, and that much of this is due to a change in our schools. Education is rarely defined nowadays as a system of mental culture, as it was fifty years ago. We believe that our leading educators would very generally agree more largely with the Greek definition, that education is to fit the children of a state for excellent citizenship. It should endow every youth with a fitness and ability to support himself in the world's competition. In order to do this it must base its work upon equal respect for hands and head. Reversing the old definition, it would say that the object of our schools is equally to give hand culture and brain culture. It is just here that our strength is found, that, while England is losing her power thru a decline of her industrial classes, the people of the United States are growing more industrial, and that this is largely due to our schools.

In the Southern States we are particularly happy in the fact that where education has to take on initial form, and is less hampered by traditional methods and ideas, industrialism is the controlling thought. Southern colleges will be found to be very much like our Western colleges, largely occupied with present day affairs—including the constructive arts and household arts. The classics are there, and there is, to a certain extent, still remaining the idea of class education; but everywhere there is the wholesome conception of education as something preparatory to bread-winning and home-keeping. The result will be that Southern society will rapidly gain in the democratic spirit, in spite of the negro question. While the races will for the present be educated apart, the inevitable result of industrial training will be to close the breach between honest workers, without regard to color. Legislation never can operate to remove prejudice; education will. When the whites of the South have learned to respect labor and to honor the achiever, they will not stand long on the color of the muscles that make the wheels go round. Heretofore contempt for a white laborer has been as general as for the black toiler. The trouble is not so much with the color of the negro, as the fact that he is considered a menial and a class by himself.

In other directions we find industrialism working out the salvation of social extremes. We have had a similar social distinction in our Northern States as in the Southern. It created Newports and Saratogas as well as factory villages; industrialism is abolishing all of these headquarters of capitalism, as such, and none too soon. Labor has entered politics, and the clash can be averted only by a speedy development of mutual respect. There are already two million members of the American Federation of Labor, at least one-half being voters. These Mr. Gompers has summoned to a hard fight, and they are responding. As long ago as 1888 labor entered the national canvass, and it must be allowed that it advocated many of the reforms which are now in the platforms endorsed by capitalists. In 1892 the Socialist Labor platform made its first appeal at the polls. It was a very modest beginning of a movement, the end of which we shall not soon see. It looks now as if socialistic labor was to be a distinct political factor in the campaign of 1908.

Industrialism has still another mission to perform. The superintendent of one of our largest reform schools, in his recent report, says that idleness is the curse of our whole reformatory system. Men and boys in the custody of the State are corraled in dingy buildings, or are left running loose inside stockades. The duty of the State is evidently to determine that every detained person, of good health, shall not only have something to do, but shall be taught how to do it well. All such establishments should be turned into schools, and the inmates should be under the most careful intellectual train-

ing, as well as physical restraint. The power of such training has been already tested and its efficacy demonstrated. The application should be prompt and universal. Education differentiated from labor is of questionable value; the mere storage of the brain with facts cannot to a certainty benefit the recipient, but knowledge, if applied, brings labor into equal honor with itself, and money becomes a mere representative of achievement. We shall probably not only industrialize our common school system, but our reform school system as well. Mere punishment as such does not belong to the State. Its function is the creating of honest citizens and a high type of manhood. It is insanity on the part of the State permanently to alienate a criminal factor of its population.

For the General Land Office

Judge Ballinger, who has been nominated to be Commissioner of the General Land Office, was selected by Mr. Garfield, who will be Secretary of the Interior after March 4th. The office to be filled is one of much responsibility, and not all of those who have held it have served the public interest. It has repeatedly been charged that commissioners have connived at land frauds, and considerable evidence in support of such charges has come to light. Recent investigation in Utah and Colorado elicited a mass of testimony from special agents and others which indicated inexcusable negligence or something worse in the Land Office at Washington. Indictments of great railroad companies and of several of their officers followed those inquiries, and more indictments are to come. The remarkable record of Secretary Hitchcock's war upon land thieves points to negligence or corruption in the Land Office. Among those under indictment and soon to be tried is a man who recently held the office of Commissioner. It is understood that Mr. Garfield is to carry on with vigor the work in which Secretary Hitchcock has exhibited so much energy. He will need the aid of a competent and trustworthy Commissioner. It is desirable not only that the thieves should be brought to justice, but also that Congress should be induced to revise the land laws, and that the President's policy for guarding the public interest in the Government's coal and oil lands should be intelligently and effectively supported by the executive officers who are directly interested in the public domain. There are many indications that Mr. Garfield has made a good selection. Judge Ballinger was his classmate at Williams College. He has been a judge of the Superior Court in the State of Washington, and was Mayor of Seattle from 1904 to 1906. Having declined at first the offered nomination, he finally yielded to the urgent requests of his classmate. In taking office at Washington he gives up his large practice at the bar.

Dr. Henry M. Field

Dr. Field, who died last week, was the youngest of a famous band of brothers. One brother, David Dudley, was for many years the leader and the Nestor of the New York bar; another, Cyrus W., was the creator of the Atlantic cable, and a third, Stephen J., an Associate Justice of the Supreme Court of the United States. Henry M. Field became a clergyman, like his father, and early the editor of the New York *Evangelist*. To this work, after a short period in the pastorate, he gave his life. His relations with THE INDEPENDENT during this time were very close and cordial. But we cannot say quite the same of his relations to the New York *Observer*, the other and rival Presbyterian paper, whose Old School conservatism did not agree with the opinions of the *Evangelist*, which represented the New School Presbyterians. There were some very sharp passages between Dr. Prime and Dr. Field which old readers still remember. But a special feature of Dr. Field's editorship was his letters of travel. He used to take long vacations, six months or a year, leaving the charge to Dr. Dey, and his weekly letters were published in many very popular volumes. As his health failed with old age the *Evangelist* ceased to be profitable, and finally was merged in *The Christian Work*, and Dr. Field retired to his old home in Stockbridge, Mass., with strength and mind impaired, until the end came in his eighty-fifth year.

That Philippine Tariff Bill

Reports from Washington say there is now no hope of passing in the Senate the House bill for a reduction of our tariff duties on imports from the Philippine Islands. A majority of the committee will not permit the bill to be reported. The Senators who are thus preventing a vote upon this important and just measure are Messrs. Burrows, Hale, Dick, Nixon and Brandegee, Republicans, and Messrs. Culberson, Dubois and Stone, Democrats. The opposition is due almost wholly to the influence of the beet sugar and tobacco interests. It was said long ago that Mr. Lodge, a member of the committee, was inclined to move that the bill be taken from it and considered in the Senate. His courage has failed him. Is there no Senator who will make such a motion? Has Mr. La Follette no interest in this just proposition for the relief of the islands? Even if there be in the Senate a majority hostile to the bill, every member should have an opportunity to vote on it, and no Senator should shirk an expression of his opinion. Senators who have voted to increase, by a twist of the tariff, the cost of the Filipinos' cotton clothing, should be willing to stand up and be counted either for or against a bill designed to help the Filipinos by giving them a reasonable market for their products.

A Pliant Reichstag

Again the Kaiser has been rewarded with a more pliant Reichstag. His appeal to patriotism to support of the country, right or wrong, and the reported aid given to the Kaiser by the Pope, seems to have broken up the majority of ill assorted Catholic Centerists and Socialists, and the new Reichstag is likely to follow where the Kaiser leads. So he will get the support of its members for his war against the natives of West Africa and for his whole colonial policy, and the enlargement of the navy. And yet it must not be thought that all will be plain sailing. While the Socialists have received a severe blow, the Liberals, who are strengthened, are no friends of Imperial prerogative, and their increased strength will give them increased courage. It is just as well that the German liberalism should not be identified wholly with the extreme views of Bebel and his followers, absolutely right as they are in their doctrine of war at home or abroad.

There was a monster meeting of Catholics in this city last Sunday night, 20,000 strong in the Madison Square Garden, to protest against the French Separation laws. From the report of the addresses they seemed to lack argument, but not denunciation. It was amid "a thunder of responsive applause" that John J. Delany said:

"We want no Bishop who is not consecrated and whose appointment is not approved by the Holy See."

Very true, but it was not till this law that the Church could have such bishops. Under the Concordat every bishop had to be nominated by the French Government to the Pope, and every local priest had to pass the Government's approval. Now for the first time the Pope can choose his own bishops, and the bishops choose their own priests with no restraint or interference. And from not a single Catholic church have the faithful been driven out.

We said it was Gen. Henry Lee, father of Robert E. Lee, who gave to Washington the famous title "First in war, first in peace, and first in the hearts of his countrymen." The Rev. C. Herbert Richardson, of Hagerstown, Md., calls our attention to the fact that, on the receipt of the death of Washington, John Marshall presented a resolution in the House of Representatives "to consider on the most suitable manner of paying honor to the memory of the man, *first in war, first in peace, and first in the hearts of his fellow citizens.*" This may be presumed to be the first coining of the phrase, but Light Horse Harry may have made it more sonorous by changing "fellow citizens" to "countrymen."

The Papal Encyclical condemning the latest French law on Church matters closes with these words, which will sound startling to ears not accustomed to them:

"Trusting that the Immaculate Virgin, Daughter of the Father, Mother of the Word, Spouse of the Holy Ghost, will obtain for you from the thrice holy and adorable Trinity better days, as a presage of the calm which will follow the tempest, and having firm assurance therof, it is from the bottom of our heart that we accord you our apostolic benediction."

Financial

The New Isthmian Railway

PRESIDENT DIAZ opened for traffic, on the 23d, the new railroad across the Tehuantepec Isthmus, which must hereafter be taken into account by our transcontinental railways, the Panama Railroad and even the coming Panama Canal. This road is 192 miles long. Its equipment is of the best quality, and fine harbors have been constructed at Coatzacoalcos and Salina Cruz, the terminal points. At the first of these ports a natural shallow harbor was improved; at the second a harbor was made in the open roadway by means of enormous breakwaters. About $70,000,000 has already been expended in the several departments of the great project. The capital supplied has been European, and a celebrated firm of English contractors is in partnership with the Mexican Government in the operation as well as in the construction of the road.

When comparison with the Panama road is made, there is on this route a saving of 1,200 miles in the distance from Hawaii and Asiatic ports to ports on our Atlantic coast or to Europe, and a saving of 1,400 miles between San Francisco and New Orleans, the latter city being only 810 miles from the eastern terminus. It is plain that the new line must be a formidable competitor of the Panama road, and that for certain kinds of traffic from or to the lower Mississippi Valley it will compete sharply with our transcontinental railways. When comparison with a canal is made, the transfer of freight from ship to train and again from train to ship, introduces an element of cost with respect to which the railway is at a disadvantage.

....An advance of about 10 per cent. in the price of writing paper and envelopes is announced by the leading manufacturers.

....E. Hayward Ferry, for six years vice-president of the National Shawmut Bank, the largest banking institution in Boston, has resigned to become vice-president of the Hanover National Bank, of New York, of which James T. Woodward is president.

....William E. Nichols & Co., of 15 Wall street, have prepared, and the *Wall Street Journal* has published, a comprehensive, compact and carefully planned tabular statement concerning the banks of the city of New York in the year 1906. It answers a great many questions, and is very useful for reference.

....The annual financial statement of the Casualty Company of America, of which Robert B. Armstrong is president, shows that the total assets are $1,879,875. Reserves and surplus to policy-holders amount to $1,738,467. The record for 1906 shows a gratifying increase in the assets, premiums, reserves and net surplus.

....As a result of the absorption of the Colonial Trust Company by the Trust Company of America, the capital and surplus of the latter company now are $12,700,000. John E. Borne, who was president of the Colonial, becomes chairman of the Executive Committee of the Trust Company of America. The other officers of the Trust Company of America are Oakleigh Thorne, president; John D. Crimmins, William H. Leupp and Heman Dowd, vice-presidents; and Frank L. Hilton, secretary.

....Charles C. Dickinson, formerly of the Colonial Trust Co., is president of the recent organized Carnegie Trust Company, whose capital and surplus are $1,500,000. The other officers of the company are Frank L. Grant, vice-president; J. Ross Curran, vice-president and treasurer; Fred H. Parker, secretary; Lawrence A. Ramage, trust officer. Among the directors are Robert B. Armstrong, late Assistant Secretary of the Treasury at Washington; A. B. Chandler, chairman of the board of directors of the Postal Telegraph Company; Arthur P. Heinze, of the United Copper Company; J. W. Harriman, of Harriman & Co., bankers; Alton B. Parker, late Chief Justice of the New York Court of Appeals; Charles M. Schwab, president of the Bethlehem Steel Company; Henry L. Sprague, of Stetson, Jennings & Russell; and James Talcott, vice-president of the New York Board of Trade.

Insurance

The Earthquake Clause in Fire Insurance Policies

An interesting decision, affecting the earthquake clause, was rendered last week before Judge Whitson, sitting in the Circuit Court at San Francisco. The jury in the case of Thomas Bergin *vs.* the Commercial Union Assurance Company of London regarded the earthquake clause, upon which the defendant company relied in resisting payment for losses arising from the disaster of last April, as insufficient. A verdict carrying judgment for $6,778 was accordingly given in favor of the plaintiff by direction of the judge, who held that if the fire originated, even remotely, from the earthquake the law compelled such a verdict. The case is regarded as a test of the earthquake clause, and may be far-reaching in its influence. In this connection it might be stated that all foreign companies which are vitally interested in American as well as Canadian business mainly by way of reinsurances accepted from American and English companies, strongly urge the adoption of a proper earthquake clause in the United States and Canada, and are working toward this end in harmony with the English companies. A committee for the investigation of this question, how best to accomplish such ends, has been appointed, and in it are represented some of the largest reinsurance companies, as the Munich Reinsurance Company, the Cologne Reinsurance Company, the Badische Insurance Company, for the German Companies; the Rossia Insurance Company of St. Petersburg and the Swiss Reinsurance Company of Zürich, which committee will report to the meeting of all companies interested, to be held again in the early part of February, when it is expected that the steps to be taken with regard to the earthquake clause will be decided upon. Insurance companies generally fully expect to arrange in some way for protection against a recurrence of the complications arising from the catastrophe on the Coast, otherwise they will either refuse to write policies in the earthquake zone altogether or greatly restrict such insurance. The earthquake clause in fire insurance policies is looming very large in importance.

Action recently taken by the directors of the Interborough Rapid Transit Company provides for a plan, to be inaugurated on February 1st, to help the sick or injured in the service of that company. The company's employees in case of accident, sickness or death will receive benefits based upon the payment of small monthly sums as premiums, ranging from 75 cents to $3 monthly. Similar insurance plans have been in force on several of the large railroad lines, and have been found to work well. The Interborough people will be entitled to receive a daily amount, varying from 50 cents to $2, according to their wages, for the first fifty-two weeks of illness or disability, and in case of death a benefit ranging from $250 to $1,000 will be paid to beneficiaries. The amount of income received from insurers under the adopted plan is not expected to be sufficient to pay the benefits, but according to published accounts the company has undertaken to pay all deficiencies to the estimated amount of $50,000 per annum.

The Union Central Life Insurance Company of Cincinnati, O., announces that the following officers were elected at the annual meeting held on Monday, January 21st, viz.: Jesse R. Clark, president; E. P. Marshall, vice-president; P. E. Williams, second vice-president; John D. Sage, secretary; Louis Breiling, treasurer; Clark W. Davis, medical director; Allan Waters, superintendent of agents; E. E. Hardcastle, actuary; E. D. Haynes, auditor; L. A. Stabler, assistant secretary; R. F. Rust, assistant treasurer; William Muhlberg, assistant medical director; J. R. L. Carrington, assistant actuary; Maxwell & Ramsey, counsel. The board of directors has the following constituency: Jesse R. Clark, E. P. Marshall, Richard Dymond, Clifford B. Wright, H. E. Holtzinger, Robert Ramsey, Clarence Murphy, Paul E. Williams, John D. Sage, Clark W. Davis, Allan Waters, Louis Breiling, E. D. Haynes, E. E. Hardcastle, R. Fredrick Rust.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The Controversy with Japan

It was asserted in special dispatches from Washington to several prominent newspapers on the 31st ult. that a crisis in the relations between the United States and Japan was at hand. These relations had become so strained, it was said, that only by an exhaustive test of the resources of diplomacy could open hostilities be avoided. Richmond Pearson Hobson declared that he had actually seen an ultimatum sent to our Government, to the effect that we must admit Japanese children to the public schools in San Francisco or "take the consequences." Authoritative denials of these alarming assertions were promptly made. Some of the stories appear to have been suggested by a conference at the White House on the 30th, between the President and California's members of Congress. After that conference the California members sent a telegram to Governor Gillette, urging him to ask the Legislature to refrain from taking any action, upon bills or resolutions or in other ways, that would offend Japan. At the same time, the members of San Francisco's Board of Education were asked by the President to visit Washington for a conference with him. They accepted the invitation. Governor Gillette sent to the Legislature the following message:

"In view of the apparent importance of the proposed conference and the great interest of California in the result of the same, I would respectfully recommend to your honorable body that the request of the California delegation in Congress be granted, and ask that all legislative action concerning Japanese matters be deferred for the present."

The Legislature consented to be guided by the recommendation. So far as can now be learned, our Government is upon the point of making a new treaty with Japan, a treaty providing for the exclusion of Japanese coolie labor from this country and also for the reciprocal exclusion of similar American labor (of which, of course, there is none) from Japan. But such a treaty, which gives what a majority of the people of California are said to desire, cannot be finally negotiated unless there shall be in San Francisco concessions indicating a recognition of the social equality of the Japanese. In other words, San Francisco must cease to exclude the ninety-three Japanese children from her public schools and must treat them as she treats Italian, German or Irish children. Japan is willing that the immigration of her laboring class shall be prevented; she prefers that the laborers shall remain at home. But on the other question of social equality, and especially because the rights involved are those of children, whom the Japanese regard with much solicitude and respect, Japan insists that her demands should be satisfied. This is said to be the substance of the statement made by the President to the California members of Congress, and it is admitted that they were deeply impressed by it. The present Government in Japan must be successful in its labors for the children in San Francisco or lose the confidence and support of the Japanese people. Much that is annoying to Japan has recently taken place in California. On the 27th ult. City Attorney Burke, of San Francisco, who represents the Board

of Education in the pending litigation, said that the Board had procured absolute proof that the Japanese are Mongolians:

"Eminent ethnologists and Oriental scholars are amazed that the Federal Department of Justice should have been tricked by its Japanese advisers into making allegations that the people of Nippon are in no sense Mongolians. We have made careful investigation of this question, and are prepared to show not only that there is a very large admixture of Mongolian blood in the Japanese people, but also that the Japanese civilization, up to the opening of Japan to foreign trade, was entirely derived from Korea and China and was essentially a Mongolian civilization."

On the 29th the California Senate adopted a resolution "protesting most strenuously" against the "unwarranted interference of the Federal Government with the management and control of the public schools of the State by demanding the admission of Japanese children to schools attended by white children." And on the 1st inst., after the White House conference, Senator Perkins made in Washington a public address in which he predicted an "inevitable conflict" with Japan, and spoke of the Japanese as "more aggressive, more tenacious and more cunning than the Chinese." Reports have been circulated that Japanese soldiers in large numbers were entering Hawaii in the disguise of laborers. These rumors are said to be false. A large majority of the Japanese arriving in Hawaii during the last few months have, after a short delay, proceeded to California or some other Pacific Coast State.——Such news from Japan as comes to the public indicates no menacing condition of public sentiment there with respect to this country. On the 29th, Foreign Minister Hayashi expressed, in the Japanese House, his expectation that concessions would be made in San Francisco, but added that "in the event of an unfavorable decision [in the pending suits], the anti-Japanese movement in California" would be "considered to represent the opinion of the whole United States, which would require diplomatic adjustment." The Japanese press, as a rule, expresses confidence in Mr. Roosevelt's influence and love of justice. Baron Kaneko, a distinguished member of the House of Peers, speaking on the 2d inst., referred to this prevailing confidence, and characterized the President's recent message on the question as the greatest utterance since the farewell message of Washington. As a sincere friend of America, he continued, he "could not help regretting that the San Francisco officials should have chosen innocent children for effecting their political ends." His friends, who had recently made comparative examination of the educational systems of the world, he said, concurred in giving to the American system the first rank:

"The fact that such an excellent fruit of civilization had been refused to the children of a friendly power, and that, too, in a country acknowledged as the practical exponent of humanitarianism, only tends to alienate it from the sympathies of the civilized world. Before this injustice Japan rests peaceful and quiet. Not a single soul has ever thought that the San Francisco affair would endanger the friendship of both nations. The affair, disagreeable and regrettable as it is, has served the unique purpose of demonstrating to the world how deep-rooted is the friendship between Japan and America. The latent cordiality Japan entertains for her tutor is shown by the fact that, suffering under the severest strain, Japan does not forget what she owes to America in her modern progress, but unflinchingly trusts in support of her rights to the justice which guides American sentiments."

The Panama Canal Contract

At the end of last week final action concerning the Panama Canal contract had not been taken. It was announced on the 27th ult., in a statement prepared by direction of the President, that William J. Oliver would have "an opportunity to make good his bid" if he should associate with himself at least two independent contractors of sufficient skill and experience, and should procure satisfactory financial support. Consent to this had been given by the McArthur-Gillespie combination of contracting firms, whose bid was 12½ per cent. This combination had declined to accept Oliver as an associate, and had declared that his bid of 6¾ per cent. was much too low. On the 29th it was made known that Frederick C. Stevens, recently appointed Superintendent of Public Works for the State of New York, by Governor Hughes, had become a partner of Mr. Oliver, to supply financial support. Mr. Stevens is a man of large wealth and the president of a national bank in Washington. In 1905, he was

chairman of the Gas Investigating Commission in New York, and by making Mr. Hughes counsel for the Commission he brought to public notice the man who is now Governor. He was appointed Superintendent in opposition to the politicians, and in that office (which he does not intend to resign) he has charge of the enlargement of the Erie Canal, for which $101,000,000 has been appropriated. On the 30th, in another statement from the White House, it was announced that no decision had been reached; that the contract has not been even conditionally awarded to Oliver; that he had been permitted to improve his "hopelessly defective" bid; that the improved bid, together with that of the McArthur-Gillespie combination, would be considered; that both might be rejected; and that it might be decided that the canal should be constructed "under the direct supervision of the Government." Two days later it was reported that Oliver had become associated with John B. McDonald, who built the New York Subway, and with five other contractors who have been engaged in large projects of various kinds.

An Apology from Swettenham

Governor Swettenham withdrew, on the 29th ult., his offensive letter to Admiral Davis, and apologized for having written it. Unofficial reports from London say that he has resigned, to avoid dismissal, and that his resignation has been accepted. On the 28th he cabled to Washington his "most grateful thanks" for 100 tents sent from Cuba by our War Department. Correspondence has been published showing the hearty approval of Admiral Davis's conduct by the President, Secretary Metcalf and Admiral Evans. This correspondence relates directly to Admiral Davis's report. Admiral Evans, his superior officer, writes that he "cannot too highly commend" Davis for "the very dignified and masterly manner in which he conducted a situation which was, to say the least, somewhat embarrassing." Mr. Roosevelt, in a letter to Secretary Metcalf, says that he has read carefully the reports of the two Admirals, and then adds the following:

"I return them herewith, and desire that you express to Admiral Davis my heartiest commendation of all that he did at Kingston. I approve his entire action. He upheld the best traditions of our navy in thus rendering distinguished service to humanity."

There is abundant evidence of Governor Swettenham's great unpopularity in Kingston. At a large meeting of citizens, the vice-president of the Merchants' Exchange presiding, resolutions of censure were unanimously adopted. These declared that the pillaging of shops and houses had been due in part to his rejection of valuable aid offered by the United States, and asserted that he was incapable of coping with the situation. The return of Sir Alfred Jones and his party to England has been followed by the publication of statements from them in commendation of Swettenham. All agreed that his conduct was "splendid." Sir Alfred remarked that altho the American Admiral was "a very nice fellow," the Governor "did right." John Henniker Heaton, M. P., said it was "wicked to utter a word against the Governor." Hamar Greenwood, another member of Parliament, comments as follows:

"The puerile criticism of the terms of the Governor's letter is simply the latest case of criticism of the strong man on the firing line by the fat fool in the armchair at home. It has come to this, that the might and majesty of the British Empire is to be withheld from her distinguished representative and is to be prostituted to an outburst of the Yankee boss."

The opinions of the London *Morning Post* and *Globe* are at variance with those of a great majority of the English papers. In a long article favorable to the Governor, the first of these asks whether there should not be an apology from the United States for permitting the publication of Swettenham's letter. The *Globe* remarks that "a strong man has been thrown down by a cowardly Government at home," whose policy is "one of fawning upon the United States." It sees Admiral Davis "seizing a heaven-sent opportunity to plant the American flag in the streets of a British town," and confronted by "a man with a backbone and an objection to regarding a British colony as a lap-dog which must wag its tail when the United States gives it a pat on the back."——Reports from Guantanamo show that in less than an hour after news of the disaster had been

received by wireless telegraph, the fast destroyer "Whipple" was on its way to Kingston at full speed, carrying surgeons, medicines and bandages.

Standard Oil Company's Methods

Congress received from the Interstate Commerce Commission last week a long report of the investigation, made under the Tillman-Gillespie resolution, concerning the relation of railways to the production and distribution of oil. It was not ascertained that any railway was interested directly in oil lands or in the production of petroleum. In recent years, the report says, the Standard Oil Company has not received rebates, but has enjoyed secret rates possessing all the elements of illegal rates, and has thus obtained a great advantage over independent shippers. It largely monopolizes the handling of petroleum from the mouth of the well until it is sold to the retailer, and sometimes until it is sold to the consumer. Its margin of profit is very large. The evidence shows little basis for the contention that the company's enormous dividends are the legitimate result of its economies. Except for its pipe lines, it has but little legitimate advantage over the independent refiner. "The Standard," says the Commission, "buys advertising space in many newspapers, which it fills, not with advertisements, but with reading matter prepared in the form of ordinary news by agents kept for that purpose. The assumption is that the literature furnishes many of the ideas touching the great benefits conferred upon the public by the company." Discussing the assertion of the report that "the ruin of its competitors has been a distinct part of the policy of the Standard," the Commission describes the company's methods, pointing out that one of them has been the organization of a perfect system of espionage over its competitors' shipments of oil. Every carload is traced to its destination, and the Standard agent there is held responsible if the oil is sold. Prices have been sharply reduced by the company at certain points to kill competition, and prices have been raised again after the accomplishment of this purpose. The Standard has secretly purchased competing companies, and, while misleading the public as to the ownership of them, has used such companies to destroy others. It has sold different grades of oil at different prices from the same barrel, has paid employees of independent companies for information about their employers' business, has paid employees of industrial companies to procure the use of its oil by such companies, and has tampered with the oil inspectors in different States. "Its motto has been the destruction of competition at any cost, and this policy has been pursued without much reference to decency or conscience. One independent, who sells 75 per cent. of his oil abroad, said that he could compete with the Standard in Germany, where the methods it uses in this country would not be tolerated, but he could not compete with it here." As for remedies, the Commission appears to have little confidence in the new law which makes pipe lines common carriers. Railway tariffs have been so adapted to the company's needs that it may not be practicable, owing partly to the destruction of competition, to eliminate the discrimination by any process of complaint against a specific rate. "Under these conditions it may become necessary to the uprooting of established wrongs and the prevention of others," says the Commission, "that the Government shall fix in the first instance the rates of transportation for this traffic."

Municipal Affairs

The legal proceedings arising out of the exposure of the Philadelphia ring have at last yielded something in favor of the city. In the city's suit to recover several millions paid on filtration contracts to the firm of D. J. McNichol & Co. (in which Boss Durham and D. J. McNichol's brother James P., a State Senator, were interested), Judge Beitler decides that, on five contracts, for $2,745,000, approved by the Council while James P. McNichol was a member of it, the profits, $117,000, must be surrendered. James P. McNichol was represented in the firm by his wife.——In New York, the company owning all the street railways has recently paid $3,170,000 of taxes due under the Franchise Tax law, but long in arrears. This was the sum due from the elevated roads alone. There

is still due from the other railways about $16,000,000, interest included. If the unpaid taxes of the gas and electric lighting companies be added, the total amount due exceeds $30,000,000. The courts have ruled against the companies in all their attempts to avoid the Franchise Tax law or to sustain their claim that it is unconstitutional. Taxes have been withheld from the beginning, in 1900. The new Attorney-General, Mr. Jackson, gives notice that he will sue to compel payment.——In a New York court a hearing is in progress concerning the charge that one Clifford, an Alderman elected by the Municipal Ownership League or party, accepted a bribe of $6,000 with the understanding that $5,000 of it was to be used in bribing the ten other Municipal Ownership League Aldermen to vote for a certain candidate for the judicial office of Recorder. A trap was set for Clifford by a reporter, who made the bargain for the votes and paid the money in marked bills, which were found upon Clifford when he was arrested.

Various Notes

At the annual meeting of the Consumers' League of New York City, last week, a letter from President Roosevelt was read. Having commended the League's "efforts to combat the evils of child labor," he wrote as follows concerning Federal action in the field of State authority:

"There is much outcry, chiefly, I think, from the beneficiaries of abuses, against interference by the National Government with work which should be done by the State Governments. I would always rather have the local authorities themselves attend to any evil, and, therefore, I would rather have the State authorities work out such reforms when possible, but if the State authorities do not do as they should in matters of such vital importance to the whole Nation as this of child labor, then there will be no choice but for the National Government to interfere."

——The *News*, of Atlanta, Ga., which gained some notoriety as an advocate of lynching, and to whose incendiary extra editions, a grand jury said, the race riot of September last in Atlanta was mainly due, has gone into bankruptcy and suspended publication. Merchants had withdrawn from it their advertising patronage.——Arizona's Legislature has passed a bill repealing the statute which permitted the licensing of gambling in the Territory.——The River and Harbor bill taken up in the House last week is the largest one on record. It provides for an expenditure of $83,816,138.——An explosion of coal dust and gas in the Stuart coal mine, near Fayetteville, W. Va., on the 29th ult., caused great loss of life. Eighty men were at work far below the surface. The dead bodies of sixty-four have been recovered.——Senator Dryden, of New Jersey, gave notice on the 4th inst. that he would make no further attempt to secure a re-election. His defeat seemed inevitable, and his health has been affected by the contest in which he has for some time been engaged.

Cuba

It has been decided at Washington, in response to a request from Governor Magoon, that the Rural Guard shall be increased from 6,000 to 10,000 men. From three to six months, it is said, will be required for recruiting the additional force.——In an interview with the correspondent of a New York paper which for some time past has been promoting the establishment of a protectorate, ex-President Palma said last week that he was confident that the United States would do all that might be necessary to make it certain that there should never be another revolution in Cuba. Senator Bravo, official leader of the Moderate party, says that the Cuban people should send to Washington a commission to negotiate the terms of a protectorate, because a revolution would surely follow the setting up of another independent Government.——At a recent raid of the Rural Guard upon a cockfight in the suburbs of Havana, Gen. José Miguel Gomez, Gen. Pino Guerra, General Monteagudo, Colonel Mendieta and other prominent Liberals were arrested. In court, each was fined $50. Owing to comments in the press, one editor has been severely beaten by Colonel Mendieta, and there has been much talk about duels.

A Possible Compromise in France

Both parties have shown a disposition during the past week to find an acceptable *modus vivendi* for Church and State in

France. The plan devised by the French bishops at their last plenary council for meeting the requirements of the law of 1907 without conceding their rights was approved by the Pope and has been published. The bishops affirm their previous declarations and renew their demand for the property of which the Church has been despoiled by the Separation Law, but they consent to the acceptance of a lease of the churches from the local authorities, provided this lease is permanent and uniform and recognizes the authority of the hierarchy. They propose a form of contract between the prefect or mayor and the curé, with the authority of the bishop, which secures to the curé the exclusive use of the church for a period of eighteen years. The mayor must renounce all interference in the religious affairs of the parish except for the maintenance of public order. It is expressly provided that the bishop shall designate the curé and his successor in the case of death or removal by the bishop. In proffering this agreement to the Government the bishops stipulate that identical contracts be made everywhere, otherwise they will agree to none of them. This stipulation is not likely to be acceptable to the Government, as it is regarded as impossible to secure the assent of all the mayors of the 36,000 communes of France to the same terms of lease. The leases have been presented by the clergy of many parishes to the mayors for signature, and the latter have been notified by the Government that they are free to conclude contracts with the curés at their discretion. The Government has removed one of the chief objections to the law by securing the passage by the Chamber of Deputies of a new law regulating public assemblies, which does away with the requirement for a preliminary declaration. The instructions issued by M. Briand to the mayors thru the prefects authorize them to lease the churches rent free for eighteen years either to common law associations or to clergymen for purposes of public worship alone. The signatory clergyman may include in the lease an acknowledgment that he derives his powers from his hierarchical superiors, but the bishop is not to be a party to the contract. If the signatory clergyman leave the sect to which he belonged when he signed, the contract is annulled, even when the contract does not contain a clause to that effect. "Archbishop" Vilatte, who attempted a few years ago to organize an Independent Catholic movement in America is now in Paris, and last Sunday inaugurated the "French Apostolic Catholic Church" by a mass in the old Barnabite Monastery. The church was packed with a hostile audience and police had to expel a hundred of them before the services could proceed.

Mine Explosions

Two severe mine disasters occurred on the same day, January 28th, in Germany and France, from the explosion of firedamp. That in the Reden Pit, at St. Johann, Rhenish Prussia, was the most fatal, as it cost the lives of 150 or more men. The bodies of seventy-seven have been recovered and the injured are frightfully burned. The explosion took place in a remote heading a mile and a quarter from the main shaft at a depth of 2,300 feet. The disaster in the Lievin mine of the Pas de Calais district, France, was not quite as serious as the number of casualties is thought to be less than fifty, but it created great excitement and alarm because it was in the same region as the Courrières explosion of last spring, the most terrible accident in the history of mining. There were 812 workmen in the Lievin mine when the explosion took place. It contains more inflammable gases than any other in the district, and Government engineers were at the time investigating the conditions there for the purpose of discovering a remedy. It was a defective safety lamp carried by one of the engineers that set the gas on fire.

German Religious Statistics

The German Government is beginning to issue the final calculations of the census taken December 1st, 1905, and has begun with the church statistics for Prussia. The Protestants numbered 23,341,502; the Catholics, 13,352,444; the "other Christians," 182,533; the Jews, 409,501; while there were only 7,344 who declared that they had

no religious creed or were of some other faith not included in these three rubrics. In this last column there has even been a reduction since the last regular census was taken in 1900, when this column had a total of 9,813. Especially in view of the phenomenal growth of Social Democracy, with its pronounced anti-clerical tendencies, and its recent propaganda for a *"Massenaustritt,"* this showing is remarkable. . . . The Roman Catholic Church is slowly gaining on the Protestant, as is evident from the following table of per cent. in the total population of Prussia:

	Protestant.	Catholic.
1867	65.27	33.17
1871	64.89	33.56
1880	64.62	33.74
1885	64.43	33.98
1890	64.24	34.23
1895	63.89	34.35
1900	63.29	35.14
1905	62.59	35.80

The *Statistische Korrespondenz* explains that this increase of the Catholic element is caused by the immigration of the Catholics from South Germany, while the Protestants of Prussia go to Catholic South Germany, so that in the Empire as a whole Protestant growth is at least equal to that of its great rival Church. Another feature is that the large centers of population are predominently Protestant. Of the 28 cities in Prussia with a population of more than 100,000, 9 have a Catholic majority, but in most cases this plus is exceedingly small. The spread of the Catholics in Berlin is notable, being now 228,948, and with the exception of Cologne is now the most Catholic city in the kingdom, while several decades ago the Catholics were practically scarcely represented in the capital city. Its Catholic population is within a few thousand of that of Cologne.

The Elections for the Duma

Political parties in Russia are not organized with sufficient definiteness for one to foretell the completion of the new Duma from the results of the primary elections which have been held. Returns are reported from 454 communes in twenty provinces, electing 908 delegates. Of these 206 are reported to belong to the Right, 631 to the Center and 71 to the Left. The Right consists of the Octobrists and other supporters of the Government, altho advocating some liberal reforms; the Left contains the Group of Toil, which was composed of the working men and peasant representatives in the last Duma, tho most members of the old Duma are ineligible for re-election on account of having signed the Viborg Manifesto. The Social Democrats, who were few in the last Duma on account of the elections being officially boycotted by the party, will be more numerous in this, but the extreme Revolutionary Socialists will have few representatives. The Constitutional Democrats, who formed the overwhelming majority at the last Duma, will not have so complete control of the next because the efforts of the Government, particularly in the construction of the election law by the Senate has been directed towards cutting down their majority, but the new Party of Peaceful Regeneration, which is regarded with more favor by the Government, is scarcely less progressive than the Constitutional Democrats, and will probably ally with them in the Duma as they have already in the secondary elections in St. Petersburg and Moscow. The leader of the Peaceful Regeneration party, Dmitri Shipov, will probably be president of the Duma. Professor Miliukov, chairman of the Cadets or Constitutional Democrats, has been thwarted by the Government in all attempts to make himself eligible for the Duma. He tried to qualify for the electoral list, first as a professor of history in St. Petersburg University, then as a householder and a responsible editor of the *Retch*, and finally under an industrial franchise as a bookseller. The Senate, however, has ruled that he can be neither a voter nor candidate because he has not been engaged in mercantile business for a year previous to the election. The Government has, however, withdrawn its contention that the Constitutional Democrats are a revolutionary body, and will permit them electoral privileges. Premier Stolypin has modified the stringency of the regulations adopted by the Governor of Moscow, who made the chairman of a political meeting liable to a fine of $250 or three months imprisonment if any im-

promptu speaker gave a wrong name or address. The premier has also issued a circular expressing the most benevolent intentions towards the Duma, assuring the people that the national parliament

"Which is the main factor in the regeneration of law and order in the State and of State principles, and which has the right of initiative in the domain of legislation, will find in the Government a sincere collaborator in its fruitful, creative and conciliatory work."

——The scandal in connection with the famine relief funds which has been under investigation by the Senate has resulted in the conviction of General Baron Freedericksz, Governor of Nijni Novgorod, for having received a bribe of $5,000 from Eric Lidwall, who had the contract for furnishing grain for famine relief. Lidwall received $900,000 in advance from the Government before supplying any of the grain.——The Terrorists continue active in many parts of Russia in the assassinations of minor officials. In Feodosia Governor-General Davidoff, in order to prevent assassination, has issued orders that all men who meet him in the street are to turn their backs and hold up their hands until he is out of sight. In Tiflis the Black Hundreds, an organization formed to fight the revolutionists by similar methods, are collecting funds by levying assessments on rich merchants and kidnapping their children.

The Famine in China

Recent reports indicate that there is no alleviation of the distress in China. Disease has joined with famine in increasing the misery of the people. Smallpox and other epidemic diseases have broken out in the camp at Tsingkiangpu, where three hundred thousand or more destitute persons had taken refuge, and the officials have broken up the camp and dispersed the people in order to prevent their perishing from disease. The Government had been distributing aid to the refugees at the rate of 30 cash (1½ cents) for each adult and 15 cash for each child. Children are offered for sale for $2 or $3 apiece, and in many cases whole families have committed suicide by drowning themselves in the rivers. The region affected by the famine is from 40,000 to 60,000 square miles, embracing a population of perhaps ten million. Of these probably one million will require food every day if they are to escape death by starvation. The spring crop, which will be harvested in May or June, will afford some relief, but, owing to the fact that most of the people have had no seed for planting, the crop will be very small. The cause of the famine was the incessant rain, continuing for nearly one hundred days. The lowlands were flooded and the crops drowned out. Great injury was done by the blunder of a Chinese official, who opened the sluice gates along the Grand Canal. The native authorities have been stirred to action by foreign criticism and are starting relief works. The distribution of money in this way is entirely inadequate. Twenty thousand dollars a day should be spent for food in order to prevent wholesale death from starvation. The National Red Cross Society of Washington has cabled $25,000 to China. Funds are also being collected in England. The Chinese Government is alarmed, not so much over the distress of the people as from the danger of public disorder and rebellion. Anti-Christian riots have occurred at Chin-Kuei, near Soo-Chow, Province of Kiang-Su.——The reforms in administration proposed by the Government have not been favorably received by the viceroys in the provinces, and the Progressive party is losing power at court. The anti-opium edict and the abolition of the classical examination system have caused the greatest dissatisfaction. The Government sent to all the viceroys, governors and Tartar generals proposals for the reform of the administration by extending local self-government as a preparation for constitutional government. It was proposed to establish a chamber for the discussion of local affairs, whose members were to be elected by the people. Courts of justice were to be established and the subordinate officials of each district given definite duties and responsibilities. Only one of the viceroys has responded to the request for their views on the subject, and he is opposed to any change. The Pekin Government has decided to open Tibet to foreign trade, and is endeavoring to raise the necessary funds for the construction of a railroad from Szechuan into Tibet.

Criticisms of "The Undistinguished Heretic"

[He is a "coward," a "hypocrite," a "clerical confidence man," a "brave man," a "lover of truth"—these are only specimens of the judgments passed on the "Undistinguished Heretic," whose "Confessions" in our issue of January 10th, have crowded our mails with replies. We can give only excerpts, just enough to show the drift of the portion of them we have selected as fairly representing the whole. Under such an impending fusillade it is no wonder he fled to anonymous cover. Possibly he will reply—we will not say.—EDITOR.]

The Christian Advocate Emphatic.

Unless a new morality has been invented the confessor shows himself to be a hypocrite and a coward.—*From an Editorial in Dr. Buckley's Paper.*

He's Afraid, Too

I want to thank you for publishing the "Confessions of an "Undistinguished Heretic" in your last issue. Please do not use my name.

PRESBYTERIAN MINISTER.

A Clerical Confidence Man

This clerical confidence man has apparently taken up with the infidel maxim, that "It does not matter what a man believes, so his life is in the right."—*Chicago Chronicle.*

A Brave Man.

Here is a brave man! He knows which side of the bread carries his butter, and he does not purpose running any chances of losing the butter. Better stifle your conscience than sacrifice your comfort.—*The Buffalo Press.*

From the Dean of the General Theological Seminary (Episcopal.)

For any one desiring subtly to undermine the Faith, and to blast the integrity of his own moral character, I think that this letter of your discreetly anonymous correspondent contains fertile and forceful suggestions.

WILFORD L. ROBBINS.

NEW YORK CITY.

The Heretic Is Not a Unitarian.

That "Heretic" scarcely allows God any privileges in this world except what the law of evolution allows Him, which is very little. He is most clearly a Unitarian, remaining in an orthodox fold, using orthodox salary to destroy the very thing which he is paid to support.

HENRY COLMAN.

MILWAUKEE, WIS.

A Lost Subscriber.

Will you kindly discontinue sending me THE INDEPENDENT. Your recent sympathetic support of the delusion of Christian Science and "The Confessions of an Undistinguished Heretic," which is simply a defense of the systematic practice of deceit, are more than I can stand.

Heresy Detectors Wanted.

One thing this prominent pastor has accomplished by his anonymous confession which we may charitably hope he did not intend: he has put all his clerical brethren of the orthodox faith under unjust suspicion. What we seem to need nowadays are listeners competent to detect a heresy when the hear it, and bold enough to challenge it.—*The Examiner.*

No Glad Tidings.

What our "Undistinguished Heretic" has to tell to sin-wearied souls I do not see. What is the call that such as he speaks in the ear of the despairing and the seeking one cannot know. What answer do they, can they, give to the ever-ringing question, What must I do to be saved? There is no answer, for there are no glad tidings.

WILLIAM AIKMAN, D.D.

ATLANTIC CITY, N. J.

From a Farmer.

I am a farmer. Two thousand years is enough for humanity to be deceived, and in the dark. If "Heretic" holds the truth let him proclaim it upon the housetops. It is a duty he is withholding from the people, who are inquiring, with Pilate of old: "What is truth?" It may cost him his present position, but what of that? To proclaim truth calls for sacrifice.

L. D. WILLETT.

WOODBINE, IA.

A Unitarian Plot?

This immediately brings to remembrance the painful preliminaries of the Unitarian schism. "The Unitarians," says Dr. Dunning, "were trying to retain the name and historic prestige of Congregationalism, while they repudiated its chief doctrines." There is a surprising similarity between the confession in THE INDEPENDENT and Dr. Dunning's description of the lapse into Unitarianism. Therefore the article raises the question whether we are now threat-

ened with a recurrence of the same thing and after the same fashion.—*The Advance.*

The Ethics of a Thief.

I have just about as much respect for the ethics of the common house thief as I have for those this self-confessed hypocrite is practicing on his congregation and denomination. To his essential dishonesty he adds the sin of being a moral coward. If he had lived in Christ's time he no doubt would have published anonymously in the *Jerusalem Independent* some nice sentiments about Jesus and meantime would have gone on drawing a good salary from the Pharisees who put him to death. To hell with ethics!

JAMES WALLACE.

NEW YORK CITY.

From a Baptist Minister

"Heretic" is plainly bound to give the whole world the benefit of his discovery. The herald of the truth should have no reserves on which to call. If the result should be that he becomes an extinguished heretic he must take his medicine like a man.

But the publication of this confession will do some good. It will call to the front other preachers who are pursuing similar courses. It will open the eyes of the people that there is a liberty of dissent, which is not to be tolerated unless it declares itself and somebody stands sponsor for the child, bastard or otherwise.

LUCIUS M. S. HAYNES.

BINGHAMTON, N. Y.

Christian Charity.

I have just concluded the reading of your "Undistinguished Heretic's" confession. "I am in a strait betwixt two." I am unable to say which is the greater idiot, the fellow who wrote such rubbish or the editor of a hitherto respectable paper who consented to its publication. The whole thing shows such a moral lapse in one who counts himself "quite good" that criticism of the thing in a serious mood is impossible. The combination of a writer who can produce such stuff and a publisher who will foist it upon an innocent and unsuspecting Christian public reminds me of two eels in a bucket of slime.

THOMAS WENTWORTH WIGGLESWORTH.

BOSTON, MASS.

From an Episcopal Rector.

When one come before us, acknowledging that he holds opinions which he is *afraid* to express because if he does so he will be turned out of office, I could not by any means, without doing injustice to my manhood, have any, the least, respect for him.

His purpose in holding on, he tells us, is, that while pretending to hold to what his Church teaches and believes, he may insidiously indoctrinate his people into his erroneous opinions; or opinions contrary to their present belief. To my eyes there is something worse in this than the act of Judas Iscariot in openly selling his Lord.

MERIDIAN, MISS. DEB. WADDELL.

The Heretic Deserves More Gratitude

After a perusal of "Confessions of An Undistinguished Heretic," I feel compelled to express my gratitude, first, to the "Heretic," for his willingness to express his opinions so clearly and fearlessly; and, second, to the Editor of THE INDEPENDENT, for his willingness to publish this worthy article. May it stir some intelligent minds now dormant on these questions of the life of Jesus and bear good fruit! I acquiesce, without exception, in the views of the "Heretic."

To my mind the "Heretic" is doing quite the best thing to remain with his orthodox congregation, and gradually lead his hearers to a larger, finer, broader Christianity. It is wise to remember that reform comes rather step by step than in strides.

ADELPHI, '04.

BROOKLYN, N. Y.

Ministers Must Be Free

I quite accept the attitude of the "Unconvicted Heretic."

If our churches are not to become the dead centers of a dying faith we must accept this freedom of thought. On no other terms can a preacher save his own liberty in seeking and using the truth. Not otherwise can the Church and the community keep step with each other in the search after righteousness.

Nor will any mischief arise if the preacher practices no deception, and enters on no concealment; if he declares the truth as he conceives it whenever the opportunity comes to him of a peaceful and healing message; if he accepts no obligations and assents to no creed in such a form that an intelligent man would regard him as foreswearing this freedom.

A COLLEGE PROFESSOR.

WILLIAMSTOWN, MASS.

A Smug Pharisee.

It is very evident that the author will never be distinguished as a "heretic" or anything else. Certainly had the Jesus of whom he claims to be a minister viewed as complacently as he does the general trend of religious thought in his day, or been as adverse to sacrificing personal comfort and standing as he confesses he is, that same Jesus had lived and died a smug and self-satisfied Pharisee.

However, as Dr. Conwell, of Philadelphia, said, in an article in THE INDEPENDENT a year or two ago, "A steeple on a morgue will not make a church," nor does the affection of children, the readiness of housewives to invite to tea, and the ability to lull your parishioners to sleep with your sermons, constitute one a "minister of the Christian religion" and a "very priest of God," important as these qualifications doubtless are in enabling the gentleman to "stick firmly where he is, a clergyman of an orthodox Church."

HORACE E. HOLLISTER, D.D.

EAST ST. LOUIS, ILL.

Oh, Yes, Quite Glad.

You say that you "*may* be glad to publish a few brief letters on the subject." I doubt very much if you will be glad to publish what I write, but I have thought that it might be of some interest to you to know how such an exhibition of dishonesty and cowardice strikes one who views things from the standpoint of old-fashioned notions of honesty and manly courage.

He does not believe in devils, big or little; but if the instinct that impels a person to live a double life for many years, in order the more effectually to betray the cause that he has sworn by the most solemn oath to defend, is not of Satanic origin, then whence does it come?

God pity the boys and girls and the poor, ignorant grown people that are being deceived to their eternal undoing by the wolves in sheep's clothing, who for a comfortable place and living barter their sense of honor and manly courage.

(Rev.) T. P. BARCLAY.

WYTHEVILLE, VA.

He Secretly Worships the Heretic.

The "Confessions of An Undistinguished Heretic" move me to declare my sympathy with those preachers who, like myself, have grown toward the truth. Secretly I almost worship the men who have so nobly faced the fagots of conservatism. Not that I agree with all they have said, but their awakened intellects and brave utterances have been as balm to my heretical soul.

If your confessional is still open, I would like to enter and confess some of my creedal sins.

[Here the writer outlines his free theology.]

Upon what ground then do I stay in the Church? Upon the truth that the Church is rapidly advancing to the point when the above so-called heresies will not be considered such. With Jesus, Luther and Wesley as precedents, we heretics will stay in as long as we are permitted.

The whole controversy is between the truth as men saw it in the past, and the truth as we see it today.

PRESBYTERIAN PASTOR.

Three Resignation Principles.

That "Undistinguished Heretic," who has just made public his clerical dilemma, was doubly considerate in his preservation of anonymity. To himself it means the salvation of his pulpit and to his readers a satisfying exhibition of candor. His decision as to his duty ought to be much easier than in most cases of the sort. The following principles may safely be laid down for his guidance:

Honesty clearly demands resignation of his office by a clergyman when (1) his beliefs differ fom those stated in his ordination vows, and (2) he thinks that the points of disagreement are regarded by the majority which has the power to make and unmake ministers as of vital importance to his function, and where (3) he held his present views at the time of his subscription, or where that profession implied a continuing adherence to its terms.

When these three elements are present it is impossible to conceive of circumstances that would justify a minister in concealing from his brethren the knowledge on which they may adjudge his case.

JAMES L. TORO.

NEW YORK CITY.

A Hypocrite.

It strikes me that this brother is a hypocrite literally; he wears a mask. To his Church he is one thing; to himself he is entirely another.

He draws his salary as an exponent of "orthodox" Christianity; while he sedulously and consciously insinuates a "Christianity" that absolutely negatives "orthodoxy," and antagonizes it. He has convictions without the courage of them; he lacks the heroic, hence the martyr spirit; his moral fiber is coarse; his conscience is out of gear.

It would seem that if he were sure of his salary elsewhere he would leave the Church to which he is confessedly a traitor. He is not in the same class with Doctors Briggs, Henry Preserved Smith, or Wm. Crapsey. These men had the courage of their convictions.

It is evident, however, that he lacks the critical faculty, and is not scholarly. He gulps things without masticating them; hence his intellectual, moral, and spiritual digestive apparatus is disordered; he lacks the power to assimilate—lacks common sense.

A SOUTHERN PRESBYTERIAN.

From a Catholic Priest.

"The Confessions of an Undistinguished Heretic" is a most peculiar production. Evidently he is drifting—has lost his anchor. I cannot imagine what kind of a gospel he professes to preach. The Bible is for him no longer an infallible book, he tells us. He has given up Jesus' virgin birth and the resurrection of Christ.

All I have to say further is, that if I held his views I would be compelled, in all honesty and manliness, to retire from the ministry of the Church I was serving and not maintain the unenviable position of a hypocrite. I have no use for pretense in or out of the pulpit.

If our "heretic" has no inspired Bible, no supernatural Christ, no prophet of Nazareth on his own showing, how does he know *what* to teach? Where is his creed? And especially, where is his *authority* as a *minister?* To me the writer of these "confessions of a heretic" is an anomaly and manifestly out of place in the Christian ministry. I write with all charity, I am simply taking him at his own valuation, candidly given to your readers.

J. C. QUINN.

TRENTON, N J

Easing His Conscience.

I have been reading and studying the letter of "An Undistinguished Heretic" this last week a great deal. I think, coming from the source that it has, it has been the means of easing my conscience considerably. While the brother is twenty years ahead of his times, and yet says nothing, I am forty years ahead of him and I still say nothing. In other words, I am what might be called "An Infidel Preacher." Force of circumstances are such that I think it expedient to go on and proclaim the things I did believe. For instance, I have a wife whose whole life is bound up in doing church work, who would literally die if she knew where I stand on the Bible and churchly things. Since I am an orator and might go high if I entered politics and threw my life into the solving of problems that to me are of importance, yet I cannot shake off the shackles without causing suspicion in her mind and bringing misery to her heart. Thus I have decided to go on as the brother has, proclaim the old things, give the comfort of words, heal the broken hearted, give the handclasp of friendship, etc.

Now, brother editor, the above is all fiction, but if it were not what would you say to it, and what would "An Undistinguished Heretic" say to "AN INFIDEL PREACHER."

From a Methodist Episcopal Minister.

TO THE REVEREND "UNDISTINGUISHED HERETIC" PRETTY NEARLY EVERYWHERE:

MY DEAR BROTHER—When Ralph Waldo Emerson was pastor of Second Unitarian Church in Boston he found his conception of Christ to be inconsistent with the general views of that denomination, and therefore, in obedience to his conscience and in spite of the protest of his people, he withdrew from the ministry. If you were only as consistent as he was you would be ashamed to accept the financial support of your denomination, not to say anything about conscience or conviction.

Luther nailed his heresy to the church door, but you crawled into a desk drawer with yours and stayed there for five years, and after you thought the fox had gone, rabbit like, you crawled out again.

My brother, genuine constructive heresy is glorious; glorious like that of Isaiah and Wyclif and Emerson, but your brand of heresy is like that which flees to Tarshish and is thrown out into the whale's belly of doubt and despair.

Make the acquaintance of conscience, courage, and consistency, and pray mightily that you may soon be cast out again on some high and dry and well-lit shore.

HANS C. NISSEN.

LEHIGH, IA.

Frankness and Cowardice

The "Undistinguished Heretic" is certainly remarkable both for his frankness and his cowardice. He is a good heretic, but he has no martyr's blood in him. That a good man in his position has the temerity so to stultify himself is certainly one of the signs and evils of our time.

He seems to be laboring under the delusion that his intellectual position is not thoroly recognized by his parishioners. Such an attitude is not easily concealed, but speaks to the world in other ways than through words. If this priest will wake up he will probably find many among his hearers who recognize the insincerity of his position, and who, taking him as an example, try to excuse their hypocrisies, and sins, and crimes, in the social and business world, with the vain plea that their priest of God also compromises himself and thinks it no evil. Such examples in the Church and its priests is responsible for much of the insincerity and crime in our society.

This "Heretic" is clearly Unitarian in his point of view. If he were brave enough to announce it he would find the world applauding and a service awaiting him, if not larger than he now has, at least more honest and pure. May we hope that he will so fear God that he will be able to drive out his devils.

A WELL KNOWN HERETIC.

Another Dr. Crapsey

"The Confessions of an Undistinguished Heretic" are but the thoughts of thousands of Christian men in and out of the ministry. I have held high office in an orthodox Church and am now accredited as one of its clergy. I, too, hold with the brave and honest Dr. Crapsey and your more cautious unknown. While nominally connected ecclesiastically, I have retired from denominational activity because, not believing any longer as my Church did, I could not preach as true what I knew to be false, and I know that to accept a pastorate and declare what I believed or did not believe, was to invite the fanatical persecution of youthful ignoramuses, who would have thought they were "doing God a service" by afflicting me in body and soul." For this reason, like Daniel of old, I have "stood in my lot" and waited. If Christianity were to be judged by the clerical treatment of Dr. Crapsey, the most of us would avow ourselves as being anything else but Christians. His forced resignation is a blot upon the intelligence and decency of the diocese which he honored by his ministerial connection therewith. There are good, earnest, faithful Christian men, who will not identify themselves with any of the sects, but who are none the less members of "the Church of God." I personally hold to exactly the same views as Dr. Crapsey and your unknown, and I keep back my name simply because I do not court notoriety.

Also Reticent.

I can only wish the "Undistinguished Heretic" success and a peaceful close of his ministry. He speaks for me, and, I am convinced, for a large number of men in our profession.

I was brought up a Methodist, and in the joy

of a new spiritual life later became a member of that communion, asking no questions. In the struggle for an education to fit me for the ministry, my health was ruined and I gained forbidden knowledge, which, however, has opened the Scriptures as never before, given a saner and deeper spiritual joy, and made me more anxious that others share in Jesus's teaching of love to God and man. I have been very reticent with this new knowledge, but in Sunday school and pastoral relations where questions are freely asked my difficulties have been frequent and painful. When squarely asked by good, trusting souls why I do not mention the men in the fiery furnace, Jonah, certain miracles, etc., in the good old-fashioned way, and why I don't have a revival and "preach Christ" as revivalists do, my soul trembles for their faith and my position. During the short times when we meet, they understand just enough to know that I do not believe this or that and will not go with me into the broader and finer interpretation. Must this whispered mistrust of my theology be borne for the sake of the knowledge that will in a few years be accepted by all? The people vote me free of other tarnish. Must I leave this work that I love so well? Must the sword that I have sharpened cut off my own head?

From a Baptist Deacon

I suppose it would be difficult, if not quite impossible, to determine what are the accepted views of most denominations today. Freedom of individual thought, if not of expression, is so rapidly approaching universality that in every denomination may be found men of almost every shade of Christian belief. You may be inclined to assert, as an intelligent gentleman said to me last week: "If one does not agree with the formal statement of belief of his church he ought at once to leave it." I do not see it so. First, because its formal statement of belief is at best but an approximation to the most generally accepted beliefs of its members, and is far from an exact and true statement of the belief of all in the Church; second, because, plentiful as are the denominations, one would have great difficulty to find such a one as exactly corresponds in every particular with his own thought; third, because one's views must be so constantly in process of change, if he is open-minded, that futile indeed would be the attempt to alter his denominational affiliations with every new step in his mental and spiritual development; and fourth, because first, last and always our churches are institutions of Christian fellowship and can offer no adequate defense for disfellowshiping one who, however at variance or erroneous his views may be, still merits the name of Christian because he has faith in Christ and accepts the truths which He taught as the fundamentals of His religion. In this day, characterized beyond all others by freedom of thought and by its rapid, almost instantaneous, and world-wide dissemination, the mere impracticability of one's attempting to keep himself in conformity with a denomination or of a denomination attempting to keep itself in conformity with the thought of its members, is relegating to the past the narrow exclusiveness of sects, tearing down their once impregnable and impassable walls, and bringing to pass that unity of Christendom for which good men have ever longed and prayed.

FRANK G. WILLCOX.

HOLYOKE, MASS.

From a Practicing Physician

The "Undistinguished Heretic" argues aright. Of course, if a man believes that his work in the ministry necessarily implies the regular preaching of certain religious dogmas, then any fixed and permanent skepticism regarding them must cancel his usefulness, and he should retire. But why need a clergyman, who is conscious of doing good and useful work in the uplifting of humanity make known his agnosticism? I do not demand that my gardener shall agree with me about the evolution of plants or the chemistry of the soil, but only that he shall make the garden productive. What sensible physician invariably shares with his patient all his doubts about the future course of the ailment for which advice is sought?

To be honest, and yet reticent; never to proclaim adherence to a dogma wherein faith has departed, yet to keep doubts to himself when their unsought disclosure would only bring hindrance to his work, and pain to simple and believing souls; to share questionings only with kindred minds; to remember that the wisest man that lives knows in reality little or nothing of the solution of the Great Problem; to preach righteousness, and to inspire it by example; to be tolerant of everything but bigotry, and sometimes of that; to fear much, to hope much, and to help much—leaving to others the defense of dogma and the championship of creeds—this is the ideal of more than one undistinguished heretic in the Church today.

M. D.

AURORA, N. Y.

Swindle, Treachery, Treason.

Does it never occur to such clergymen that, if they succeed in convincing us that the resurrection of Christ did not actually take place, we are going to reject Jesus Christ as well as all His ministers? Neither "limited atonement" nor "Scriptural infallibility" is mentioned in the Apostles' or Nicene creed. They were human theories, and do not afford a parallel case. The resurrection and the virgin birth were facts or they were not facts. If they did not occur, the Gospels are lies, whatever charitable explanation may be attempted for the authors. If those Gospels are not substantially true in the facts narrated, I, for one, will have nothing to do with Christianity in any shape or form; if Christ did not rise from the dead, I consider Him a sentimental dreamer and His apostles worse.

Meanwhile, we who believe in the deity of Christ support a clergyman, not because he is an amiable man and children run after him in the streets (by a judicious use of confection-

ery I could get as many children to follow me as the Pied Piper of Hamelin), but because he is our spokesman and leader to say for us to an unbelieving world that we acknowledge Jesus Christ as God Incarnate. If, then, our chosen spokesman, instead of carrying out our trust imposed in him, is secretly preparing to persuade us that Jesus Christ was not what we believe Him—I know not what heretical clergymen think of such conduct, but in business it would be called a swindle, in social affairs treachery, and in the nation treason.

F. M. OCKFORD.

RIDGEWOOD, N. J.

Not From the Housetops.

I wish to place myself beside the "Undistinguished Heretic" in sympathy and approval. I believe he can do the Kingdom of God and his own denomination greater service by remaining in his place preaching the Gospel of Jesus Christ *as it has been revealed unto him*, than he can by withdrawing on account of his disagreement with his denominational standards. He is not alone. Many people would say that my position is one which especially calls for conformity to our denominational standards. I am not a pastor, but a missionary, working under our Foreign Board. My denomination is not one which has a clearly defined system of doctrine; yet it has its standards by which the Church at large measures orthodoxy. I am perfectly well aware that some of my beliefs are far removed from these standards and that our denomination as a whole would regard my positions as unsound and dangerous. I have reached these positions by quiet reading and reflection and they have been greatly fortified by my experience as a missionary among a heathen people. I have no intention of proclaiming my beliefs from the housetops. I have no ambition for a place beside Dr. Crapsey. I prefer the life of an obscure ambassador of Jesus Christ in a heathen land. I believe that God has commissioned me to preach the Gospel which he has revealed to *me*, not that which is supposed to be summarized in those formal confessions which have honorable places in our denominational history. I do not hide my beliefs from my colleagues. I shall try to be wise in my use of them, especially among my native Christian brethren. But I will not teach them those beliefs of our denomination which I have rejected. MISSIONARY.

Paul or Gamaliel?

What if you are driven from your pastorate by a frank, sincere, statement of your real theological belief? The next man may do better work in your parish than yourself, and you do even more for humanity elsewhere. To my mind, you have much too good an opinion of yourself—a special sin of us preachers—for you would not tolerate such double-face in a politician. You would never have followed Jesus boldly in the bygone days, but you would have gone to him by night, and held your place in the synagogue. You would not scurry to put yourself in the pillory beside Him if He were here today, much as you might admire and honor Him.

Suppose all preachers would use your philosophy, how would the man outside of the Church respect our manhood? He certainly would doubt our sincerity, and he would have a right to do so. Your beliefs, many of which I agree with, would never have been held by yourself, in all probability, if other men had feared an avowal of theological truth as yourself, and had fooled their hearers and supporters day by day.

And can we not rejoice, Brother Heretic, that the early martyrs, and the apostle to us Gentiles, Paul, did not have the same philosophy of actions as yourself? You remember that Paul did not write under a *nom de plume*, but proclaimed aloud that after the way which they called heresy, so worshipped he the God of his fathers. But perhaps Gamaliel and not Paul is your ideal.

May God help you to be brave to preach the whole Gospel in the pulpit, as well as in THE INDEPENDENT. To give you an object lesson, I will sign my name and address.

CARLYLE SUMMERBELL.

SWANSEA CENTRE, MASS.

His Pastor Mustn't Read This.

I am sixty years old; have been an active member of the Presbyterian Church for forty-five years, and my reading and thought and experience have at length brought me to believe just as your "Heretic" does. During all those forty-five years I have constantly been contributing to the erection of Presbyterian churches, or to the payment of Presbyterian church debts. I have made a number of residence moves, and each new place finds me contributing either to the wiping out of an old church erection debt or to a fund for the building of a new church. So that I may now be said to own quite a block of stock in the Presbyterian Church, altho I do not have any formal certificate to evidence such holding. When I joined the Church at the early age of fifteen I made the usual public confession (or declaration) of two things, viz.: First, that I would try to be as good as possible, and second that I believed a lot of things. Now, as to this second point, the Church took advantage of me because they knew I was too young to be capable of having an intelligent opinion on those beliefs.

Now, in the face of the fact that the Church took advantage of me in allowing me to declare my belief in things that it knew I could not understand; and in view of the further fact that I own a good deal of church stock which I forfeit if I go out; you may say that it is the right and duty of the Church to exclude me. I do not believe it. We heretics cannot form new churches—for one thing we cannot afford it—*wealth* is always conservative, it is satisfied with things as they are—why should wealth want any changes? So that we heretics must stay in the orthodox churches and do what little we can to reform them, and patiently wait, just as your "Undistinguished

Heretic" is doing, for things to come our way, which they are sure to do, soon or late. One must be as blind as a bat not to see that things are coming the heretic's way fast enough.

My name (tho very undistinguished) must be kept out, for the pastor of my church has his nose held high on the scent for heretics.

A PITTSBURG HERETIC.

Now on His Feet.

I quake for you. If THE INDEPENDENT should violate the *sigillum confessionis* [impossible!], by revealing your name, you would speedily go the honorable way of Crapsey *et al.* Lacked your "Confessions" but one thing to make them important and valuable—namely, your name. With that, they would have been a chapter in the rehabilitation of the Christian Church, penned not by an "Undistinguished Heretic," but by a distinguished hero of the truth; without it, they are only the apprehensive chattering of a man afraid of his shadow.

Your excuse is unpleadable; nay, it leaves you more than half submerged in a sea of obligation. It is your plain duty to help remove the discredit from the Church. That you can do only by standing to your colors, not by fighting under the enemy's. You are in the vanguard; I pray you be valiant.

Alas! you but add to the discredit. You betray the Church in triplicate. By your silence you betray orthodoxy; it is not presented from your pulpit, as it is supposed to be. You betray heterodoxy; it is made to appear thru you a cowardly, slinking, underhanded thing. You betray the ministry; you justify the oft-made charge against it, of insincerity, by *violating the vows you took at your ordination.*

Notwithstanding, sir, to you I am grateful. Your "Confessions" have put me on my feet. Scarce three years out of two theological seminaries, where I heard all devout prejudice and pious sophistry summoned to refute (the actual chief function of the modern theological seminary is to refute heresy) things which I have since concluded are irrefutable, I was in a maze of indecision. But you have enabled me to decide that neither you nor I have any *silent* business in the orthodox ministry.

GREER A. FOOTE.

DELAWARE CITY, DEL.

Orthodoxy and Science

If "The Confessions of an Undistinguished Heretic" were but a single isolated instance it would be of some interest, but since it is an expression of a condition that is becoming general, it involves some serious questions. The experience of the author is only another indication of the fact that the miraculous has no place in our experience today. None of us ever saw a miracle, and, different from former ages, we would not assign to a supernatural cause any phenomenon however little understood its nature. Can a religion, grounded in the miraculous, be any more real to people than the foundation upon which it rests? Numbers of people unable to distinguish between the content of Christianity and the forms in which it is presented, are either nominally accepting creeds and ceremonies that now have lost their vital significance, or find themselves out of sympathy with the Church and its teachings, for the reason that orthodoxy insists upon an interpretation of religious phenomena that finds no place in the life and thought of our world.

There are many ministers who believe as the writer of the article in question does. If these things they have learned are true, it is not unbecoming in a minister of Christ to be afraid of the truth, no matter what it is. Instead of treating these scientific and historical truths as tho they were dangerous secrets to be covered up lest they wreck God's Kingdom, why do they not come out boldly and separate religion from the forms we have outgrown, and insist upon an interpretation of Christianity that is consistent with the experience of our time? Surely God's truth will not destroy itself. The people are finding out these things anyway. The longer we wait the wider will be the chasm to bridge, for one false position leads rapidly to another. Instead of constantly thinking of the weaker brethren whom such preaching would shock, ought we not think of the many people outside of Christianity and between whom and Christ the orthodox position stands as a barrier? Would not people have more respect for the ministry, and does not common honesty demand it?

E. D. MARTIN.

LOMBARD, ILL.

Not at Ease in Zion

The "Confessions of an Undistinguished Heretic" and your editorial comment thereon have aroused in me an extraordinary interest. I am not a clergyman, but otherwise his experience and conclusions might be my own. Not quite, for while I do not press my views upon others, I probably do give, upon suitable occasion, somewhat freer utterance to them. It is generally thought that a layman may hold any view he pleases, at least in a Congregational church; but I must say that I am not at all clear as to that. The Church of which I am a member has a creed, I believe, tho I have never seen it or heard it read in seventeen or eighteen years of membership. There are, however, implied beliefs in the covenant to which I must assent at almost every communion. It is possible to give meanings to the words which I can accept, but I know that these are not the meanings as understood by the majority of the Church, nor are they what was originally meant.

I joined this Church by letter, mainly on account of my family, but nevertheless in full sympathy with the practical aims of the Church. The saving of men, to be sure, does not mean the same thing to me. I accept joyously and freely the teaching of Jesus as to the conduct of life. I believe that the Golden Rule lies at the very base of civilization and that no real progress can be made without it. In this respect I go a long way beyond the Church in urging the extension of the rule to communities and nations.

Still every organization has a right to fix the basis of union. It may make a mistake, but the right—perhaps the duty—remains. Should one seek to enter an organization with whose very basis he is in antagonism? At any rate, I think the members of it who do think the basis vital have a right to decline his company. I should not, therefore, complain if the Church saw fit to cast me out. If it were to do over again I should not now connect myself with any Church, even by letter, but I stay by force of habit and, as I have indicated, by real sympathy with its practical work. And yet I do not feel at ease in Zion. I often think I could do more outside the Church than in it, and at the same time free myself from what I am bound to think a false position.

ANOTHER HERETIC.

The "Delicate Effluence."

The "Confesions of an Undistinguished Heretic" has value from its representative character. It reminds one of the eloquent and earnest utterances of the brilliant Theodore Parker, and of Robert G. Ingersoll, as well as of those more recently expressed by the Rev. Dr. Crapsey, and some in almost every denomination. All such profess to find a richer religious experience in holding to such views than they derived from the Apostles' Creed, and from the Scriptures, regarded as the infallible word of God. No one can absolutely know the experiences of another. Let us accept, with charity, the personal statements of all men. There are in this article fifty statements, as if of facts, which do not seem to us correct. Inferences and conclusions are set forth as established and necessary, which seem to us to have no support. We sympathize with the writer in his love of independent thought and in his search for truth. But almost all his opinions seem to us contrary to reason and to truth. We can well understand that his secret views, tho not preached, allow, as he felicitously expresses it, "occasionally a delicate effluence from them to steal over a page or two of the next Sunday's sermon." Very many sermons of the day reveal a similar "delicate effluence."

One is surprised in hearing a discourse which is mainly excellent, sometimes truly eloquent, contain passages which startle him with the question, Where he is and whom he is hearing? He recalls some similar statements as preserved in the pagan classics, but not often repeated since the Christian Era. One is shocked and feels a deep sense of pity, but fondly hopes that he did not fully or correctly understand the preacher, or that if he did, the preacher is somehow far better than his doctrine. A blessed inconsistency in real belief and life is hoped for.

The main question is, "Is there anything supernatural? Any miracle? Any revelation?" Few are as yet prepared to say "there is no God." More are willing to be called agnostics, and say: "We cannot possibly know of a God." "Miracles are impossible." "There is no supernatural separate from the natural." The "Confessions" form a very interesting expression of a mind moving somewhere in this current trend of modern scepticism.

A VETERAN THEOLOGICAL PROFESSOR.

From an Ex-Roman Catholic Priest.

In reply to your suggestion, permit me, as one who followed an opposite course, to send an answer to "The Confessions of an Undistinguished Heretic."

Is there any situation under the sun which calls for the truth like that of a clergyman in a church pulpit? True, he may preach upon moral topics solely, untouched of doctrine. But all the same, like the sounding disk over his pulpit, the shadow of a creed or a confession or the Thirty-nine Articles, hangs over him, invisible indeed to the human eye, but tangible to the Christian souls beneath. He rejects his creed as false, while his flock accepts it as true. And when his preaching is done, young and old join in singing hymns, which ring out thru groin and arch the teachings of his peculiar orthodoxy. There is only one appellation, which fits him. Such a pastor is a whited sepulchre.

Let me add, however, that there are two great defenses, which he pays little heed to in his confessions: First, the lie or deception or sham is universal. It is as much in evidence in the State as in the Church, in the stock exchange as in the counting room, in law as in medicine, on the rostrum as in the pulpit. From the dawn of reason men must watch out for and more or less practice sham. Revelation at least, if not religion, *quâ* creed, is a huge deception. It puts forth as truths, revealed to Adam, Moses, Christ, the Councils data, which are known to be human, or else data, recognized as false, *e. g.*, the virtues as Christian, which come from Aristotle; the age of the world, the plenary inspiration of Scripture, etc."

Secondly, religion exerts little influence on men's lives. This, indeed, should comfort our unknown. From the way men live, do business, associate, pass their days, it is impossible to tell their creed. Religion, in fact, counts for nothing in the every-day world.

But should not the clergy be the prime movers for honesty? Should not the speech and life of a minister reflect the soul within the man? The truth is, that all history is evidence of the contradiction, which we call a clergyman. Long ago mankind abandoned hope of truth in the ministry. Now they are looking elsewhere. Let us hope that the uplifting and upbuilding of the proletariat will make this twentieth century the age of truth.

J. R. SLATTERY.

PARIS, FRANCE.

The Heretic No Critic.

A man may believe what he pleases, but it is a question affecting ethics and seriously concerned with moral law for a man to confess himself out of harmony with the Gospel and with the fundamental doctrines of his Church and yet continue to hold its pulpit and give his

people his "heresy" in such regular homeopathic doses that he poisons their faith so insidiously and effectively that his "recent declarations, so far from stirring resentment, have scarcely kept his congregation awake." There is nothing that our rugged American people admire more than for a man to stand on his two feet—scaffolding or no scaffolding—and confess his real faith, even tho he be a "heretic." The gentleman refers to Dr. Crapsey, and therefore we may be excused if we express our conviction that the position of that man shines as a morning star in comparison with the lightning-bug emissions of the "Undistinguished." There seems to be but one proper course for him to pursue, and that is to withdraw from his Church.

The gentleman comes to his conclusions thru the mistake of reading into the text what is not there and not discriminating what is there. He would have us believe that Matthew calls Jesus "the carpenter's son"; Mark the same; and John he makes call him the "son of Joseph." Neither of these is the fact. Matthew *records* that *certain people asked* "Is not this the carpenter's son?" Mark *records* that *certain people asked,* "Is not this the Carpenter?" John *records* that the *"Jews* murmured" that Jesus called himself the "bread from heaven" and *asked,* "Is not this the son of Joseph?" Neither of these writers call Jesus "the carpenter's son"; or "the carpenter"; or "Joseph's son." They only as faithful biographers note the fact that certain people asked these questions. They could do no less. It is not their opinion. Other people in that time called Jesus by other names than these. Some said he was "Elias"; "one of the old prophets"; "Beelzebub," and Herod said he was "John, whom I beheaded." It was not an unnatural thing that some should call Jesus the son of Joseph. Similar mistakes occur in most communities where a child goes by the name of its stepfather, or where it is an adopted child.

The other objections he raises concerning the resurrection of Jesus are as gross misrepresentations of the text as these. The "Undistinguished" will evidently never become distinguished as a real critic, tho he may make some headway as a careless writer.

W. T. Foote.

Jefferson City, Mo.

From a Convicted Heretic.

Referring to "The Confessions of An Undistinguished Heretic," I have reason to know that his attitude is that of a large and increasing number of ministers in the various churches—Protestant and Catholic. Letters have come to me from so many who are of this way of thinking that I am convinced that the churches are honeycombed with creedal and confessional unbelief in the pulpit. The result of this is seen in the loss of intellectual and spiritual leadership to the ministry of the churches. Men and women who hunger for the truth do not look to have that hunger satisfied from the pulpit.

Such men as the writer of the confessions can keep a congregation quiet and comfortable, but can never inspire the people with enthusiasm for truth and righteousness. At the best, they are priests of the present order, not prophets of the better day. The writer justifies his infidelity to truth by his fidelity to love. According to his confession he's a bad preacher, since he systematically suppresses his deepest convictions, which no good preacher can do; but he is a good pastor, since he visits the sick and the poor and the sinful. In this the writer of the confessions yields to one of the most subtle temptations of his calling. It is as if a bank clerk should rob the bank to succor a wife and children from death.

The writer of the confessions consoles himself with the thought that whether he speaks it or not the truth will at last be known. He is content that others should labor while he quietly bides his time to reap the fruits of their labors. Truth does not come of itself. Some man must think it; some man must speak it. The man who thinks and speaks is the man who advances the cause of truth in the world. The man who waits until the real thinking and speaking is done is not a worker, but a drone, eating the honey that he has not gathered—an apparently safe but really a dangerous course! In time drones are killed.

Today the real thinking and speaking on the great subjects to which the writer of the confession refers are being done by men who are not the official teachers of the Church, and in consequence the churches are discredited. The people are learning from others what they ought to have learned from their pastors, and that is good neither for people nor pastor.

In the recent case of heresy in the Episcopal Church it was not the people who hunted the heretic; it was the bishop and some of the clergy. As a whole the people condemned the proceeding. In all that pertains to religious truth the people have left the bishop and clergy far behind—which bodes ill for bishop and clergy.

Algernon P. Crapsey

Rochester, N. Y.

The Home Colony: Six Months After

BY UPTON SINCLAIR

Author of "The Jungle," "Manassas," Etc.

SIX months ago The Independent was so good as to publish my article entitled "A Home Colony: A Prospectus," which resulted in the Helicon Hall enterprise. The editor has requested me to write another article, setting forth what has been accomplished toward the plan, what successes and what failures have been met.

About 300 people responded to my call. If I had been the master of my own time I should have got together a dozen or so of those who showed the most active interest, and proceeded to work out the plan privately. I was tied up, however, in an attempt to dramatize "The Jungle," and so I called a public meeting, thinking that the enterprise had only to be launched and would then take care of itself.

One meeting, however, was enough to make it evident that the plan could not be worked out in general meetings, and so committees were named. One of the unfortunate consequences of the public manner of proceeding was that unfit persons were named on the committees, and the work greatly delayed thereby. Perhaps, however, it was just as well, for it brought to a head immediately one of the all-important problems—the conditions of residence and membership. I personally had always thought of the colony as a public affair—a little village, so to speak—to which any one might come who paid his way and obeyed the law. But experience soon convinced me that the question of congeniality was one of the all-important ones. The task of elimination was an unpleasant one, and it was not accomplished without mistakes. But it had to be accomplished.

The committees met all thru the summer, and every detail of the proposed organization was threshed out. We made an attempt to estimate the quantity of land and capital needed, and the probable cost of all the various items. We discussed the form of the proposed organization, and all the legal questions involved—membership and the rights of members, ownership of stock and voting control, as well as questions of administration and of social organization, the workers and their status, the children's department and its management, and a hundred other equally important problems. I had outlined my ideas of the colony in the beginning, but I had no means of knowing how far they would be agreed to by others. As a matter of fact, however, there was no really important modification, except the one which I have previously mentioned; and the Helicon Home Colony, as it actually exists, is practically the one which I pictured in my first article.

Besides the discussion of abstract principles, the committee meetings gave those interested a chance to get acquainted and to size each other up. There were many friendships made and many informal meetings. We solved some of the most important of the colony problems one moonlight night, drifting about in a sail boat on Barnegat Bay. Another time, some of the "colonists," as we came to call them, paid a visit to my farm near Princeton. We put the women up on cots in the house and the men slept in the hay-mow—which gave them an excellent opportunity to find out how they got along together. The result was that, by the time that we got down to the search for a site, there was a compact little group of people who were ready to take the plunge together.

When the Helicon Hall property was discovered, thru a newspaper advertisement, we held several anxious confer-

ences. It was really quite a fearsome proposition, for Englewood is an expensive place in which to live. We had been figuring on land at $200 an acre, and this land cost $3,000 or $4,000 an acre. And the Hall itself was an enormous place; it would cost $1,000 a year for coal alone; and if only our own little group should come in, the cost would be prohibitive—we, and our wives, and our children, and our beautiful rubber trees and palms, would all freeze to death before the winter was by. On the other hand, we had faith in the idea, and we knew that the larger the colony, the greater the advantages for all concerned; and if we were to buy a small place, we would tie ourselves down to an experiment upon a small scale, and would never be able to demonstrate the real advantages of household co-operation. Our idea had been to rent some place for the winter, which would have given us some time to work out our plans and get ready for the larger venture; but we had not been able to find a place suitable for renting—Helicon Hall would not do, for the reason that expensive repairs were necessary.

To make a long story short, we made the purchase, and some of the more venturesome moved in at once. The colonists who shared in the turmoil and confusion of those early days will not soon forget them. We were tumbled in bag and baggage; we could not even unpack, because all the rooms had to be kalsomined, and we moved here and there at the behest of men with large buckets of paint. We had no furniture, and no food, and no fire, and no cook; we lived on crackers and milk, and we would spend hours hunting for a teaspoon to eat with. It was only last October, but so much has happened since that already it seems like ancient history, and we gather 'round the fireside and fight our battles over again. We have a huge and wonderful fireplace, the four sides of which we have awarded in our colony jests to Politics, Art, Literature and Philosophy. But in those days all four sides were allotted to colony business, and we would huddle 'round the fire and creep closer as the night wore on (that was before we got the furnace running). Many a time I sat on the andirons at 1 o'clock in the morning, discussing plumbing specifications with the manager.

HELICON HALL—EAST EXTERIOR.

We had not only to remodel the building and equip it completely; we had to find a staff of people to do the

SOUTH END OF INTERIOR COURT.

work, and also to organize the colony, keep in touch with hundreds of people, who wrote letters and called on all sorts of strange errands. Incidentally, also, we had to keep ourselves alive. We all managed to stand it after a fashion; and now and then, when there was too much grumbling, we would call a public meeting, and thresh out our troubles and start over again with a new supply of good nature.

We made many mistakes; I shall tell about some of them in due course, for the benefit of future pioneers. But there is one thing to be said here at the start: we made no mistake in believing in democratic institutions. It was a point about which the critics of our plan were all agreed, that it could not possibly work, because people could never decide what they wanted. That dreadful bugaboo called "human nature" would wreck us in the end. I, for my part, believed that people in America were used to the methods of majority government, and I believed that if we should apply those same methods in a co-operative home, a group of intelligent and sincere people could manage to solve all their problems. From the beginning our policy was publicity and democracy; and from the beginning it brought us through. At the committee meetings every one had his say. And little by little you would see a majority opinion taking shape on the question at issue, until, finally, when all had been heard, the matter was put to a vote. There was no case where the minority did not give way with all courtesy. And now that the colony really exists we sit round the fireside and talk out our questions, and as a rule we do not even have to take a vote—an informal discussion is enough to make clear to every one what is fair and right. The question came up as to whether or not we should admit small babies to the colony this winter; and there were two people of studious tastes who took violent exception to babies. There was a meeting, and a discussion of ways and means, at the end of which the two disciples of race suicide were satisfied. In the same manner we decided the hours for dancing and for piano playing, and all the problems of the children's department and of the dining-room. The editor of *Ridgway's* once made the prediction that the colony would fall to pieces because some of its members would want marmalade for breakfast. As a matter of fact, one could not find people of more varied tastes. We have

a dozen different varieties of vegetarians and some devotees of the flesh-pots; but we have no one who is unwilling to compromise and to put up with the best that can be done.

I am a believer in the materialistic conception of history; I am accustomed to interpret the characters of men from this position — to say that competition has made them selfish and deceitful, and that co-operation will make them beautiful and sincere. I think that I can see it working out in this colony. We have founded it upon justice and truth; socially we stand upon terms of equality, and economically we pay for exactly what we get. These are the principles we have built upon, and all take them for granted, and no other idea ever enters their thought. You may smile, perhaps, when I say it, but it is a fact none the less, there are 35 adults and 10 children living in this house at present, and I know them all pretty thoroly, and there is not anywhere among them a jealousy, or a hatred, or an unkind or selfish feeling.

"But will this last?" you ask. I do not see how it can fail to last, and to grow—admitting, of course, that my analysis of the cause is correct. We did not start out with any enthusiasms and religious ecstasies; we had simply cold common sense; we employed lawyers and business men to put us on a sound basis. Our only real peril was at the beginning, before the colony spirit was well developed in our members, and some of us were tired and overworked; and even then there were no misunderstandings that a little discussion could not clear up. Now things are beginning to run smoothly, and we are realizing some of the benefits.

I have sometimes thought that we made a mistake in calling our adventure a "colony." The name suggests "Brook Farm," and "Ruskin," and similar co-operative experiments; whereas, as a matter of fact, there is not the least similarity. All these colonies were experiments in co-operative production; the Helicon Home Colony is an experiment in co-operative distribution. Its members are all earning their livings in New York; they are not trying to dig them out of our few acres of land. And perhaps if we had called ourselves a "home club" or a "co-operative hotel," people might have understood more readily what we are really doing. As a matter of fact, what we have here is a large and

DINING ROOM.

exceptionally beautiful hotel, which is owned by its guests, and run by them to their own taste and for their own profit, instead of being owned by a business man and run by him for his profit. And in my view of the case the one question to be considered is this: Can people living in such a manner get for themselves more material comforts and social and intellectual advantages than they can get for the same money in their individual homes? Upon this, and this alone, depends the future of our "colony."

What do we get here at Helicon Hall? We are as yet in our infancy, of course; there is no one of the departments in which we do not intend to make numerous improvements; but we have got over the roughest parts of the road, and we can begin to look about us a little. We are living in what I think is the most beautiful suburban town near New York. We have nine and a half acres of land, sloping down from the western brow of the Palisades, and commanding a view of fifty miles, and we have only half a mile to walk to come out upon the Hudson, where there is scenery which tourists would travel many miles to look at, if they only knew about it. The hall itself has about eight thousand square feet of floor space on the ground floor alone, devoted to rooms for social purposes; there is a central court filled with palms and rubber trees, which have grown to the very top of the three-story building. We have a large pipe organ, a swimming pool and bowling alley, a theater, a billiard room and a studio. We have thirty-five bedrooms, ranged in galleries about the court, so that we can look out of our windows in the morning and see the sun rise, and then look out of our door and see the tropics. We have the finest heating system in the world; we pump fresh air in from outside, heat it in a three-thousand-foot steam coil, and then distribute it to all the rooms, with the result that we feel as well all the time as other people feel when they take a trip to Arizona or the Adirondacks. In such a place as this we have a comfortable bedroom or study, where we can go and be by ourselves and never be disturbed, for $3 a week. And downstairs we have a huge fireplace, where, if we happen to feel in a social humor, we can sit and discuss Politics, Art, Literature or Philosophy with our friends. And also, we have a dining-room, where a group of cultivated people meet three times a day to partake of wholesome and pleasant-tasting food, prepared by other members of our big family, whose cleanliness and honesty are matters of common knowledge to us. This last-named privilege costs us $5 a week, or $4 if we only eat two meals; and we do not have to add to this price any care or worry, because the price includes the salary of a superintendent and a manager, who work sixteen hours a day each to straighten out all the kinks and keep the machine running.

Finally, this magical building contains a dormitory and a children's dining-room and play-room, where ten happy and healthy children receive their lessons in practical co-operation at a cost of four dollars a week for each child. It was over these "institutionalized infants" of ours that the critics of our plan were most incensed. Several dear ladies who had read my books and conceived a liking for me, sat down and wrote me tearful letters to point out the wickedness of "separating the mother from her children." As a matter of fact, we have five mothers in the colony, and the work of caring for the children is divided among four of them. (The fifth is studying medicine in New York.) By the simple process of combining the care of the ten children we accomplish the following results: First, the labor and trouble of caring for each child is reduced about two-thirds; second, the child has playmates, and is happy all day long; third, we can afford to keep the child in a more hygienic place than the average nursery—we have a pump driving fresh air into his play-room all day; and, fourth, we can dispense with the services of nursemaids, and go away, leaving the child in the care of a friend.

Of course we cannot have everything that we should like in the "children's department." We have to wait for more colonists for that. With only ten children we have to dispense with a resident physician; we cannot even afford a kindergarten. And, of course, we have not the scientifically constructed dormi-

tory of which we dream; we have only a converted theater, and instead of the uniform cots and the dustproof walls and all the rest, we have to make apologies to visitors. However, our children are all enjoying it meantime; and our five mothers are holding meetings and learning to co-operate.

The other big problem which we promised to tackle is the servant problem. All the world is waiting to hear about this, so we are told; even the aristocracy of Englewood is waiting; the

STAIRWAY.

ladies come in and tell us their troubles and ask if we will feed them in cases of emergency. They were even going to invite me to lecture them about it—until one of them recollected that I was a Socialist of a particularly dangerous type.

We have been only two months at it; and we have still a great deal left to accomplish. But we think that we have got far enough to claim to have proven our thesis—that by means of co-operation, with the saving which it implies, the introduction of system and of labor-saving machinery, household labor can be lifted to the rank of a profession, and people found to do it, who can be admitted to the colony as members. Those who wish to make fun of the idea have assumed this to mean that we insist upon college diplomas from our cooks and chambermaids. It does not mean that at all; as a matter of fact, we prefer to employ people who have always earned their living by doing the work they do for us. It means simply that we look for people who are cleanly and courteous and honest; and that then, when they come into the colony, we treat them, simply and as a matter of course, exactly as we treat every one else. So far as I know, there is no one here who has experienced the least difficulty or unpleasantness in consequence.

There remains to explain the financial organization of the colony. The property is owned by the Home Colony Company, a separate corporation, which was formed to raise the necessary capital. The company puts the building in thoro repair and equips it for use as a residence, and the colony rents it upon a three-year lease, assuming responsibility for the interest on the mortgages, the insurance, taxes and other charges, and paying 8 per cent. dividends upon the company stock. The ownership of stock is thus entirely optional. One may live in the colony without contributing any capital.

The Helicon Home Colony is a membership corporation. It is governed by a board of directors, elected every six months by secret ballot. The only conditions to residence in the colony are "congeniality" and freedom from contagious disease; one may reside in the colony indefinitely without becoming a member, but only members have the right to vote. The conditions of membership are one month's residence, election by a four-fifths vote, and the payment of an initiation fee of $25.

The constitution of the colony provides for initiative, referendum and recall of members of the board of directors; also for a complete statement of the financial affairs of the colony, to be rendered every

three months. Other provisions of the constitution dealing with its financial affairs are as follows:

It should be the aim of the colony to finance its affairs in such a way that it may ultimately be independent of all outside financial assistance. All goods shall be purchased through the Colony store, to be obtained at wholesale prices as far as possible, and charged to the colony at retail prices. One half of the fund thus accumulated is to be rebated to the membership and residents every three months, pro rata to the amount paid in. The other half is retained as a working capital and sinking fund, being credited to the member or resident until the amount contributed by him has reached $1,000, after which the entire profit shall be rebated to him.

On the colony books workers shall be figured as paying boards at current rates, and shall receive dividends upon this and all other payments to the colony.

Every department of the colony work is to be figured separately. All supplies used in that department are to be charged for by the store at retail prices, and supplies from that department to be sold to the store at wholesale prices. Every department shall be required to show a profit upon that basis.

These provisions will help to make clear the following financial statement, which shows the income and expenses of the Helicon Home Colony, upon a basis of the capacity of the present building—47 guests and 15 workers:

Fixed Charges:	
Interest on mortgages	$1,800
Interest on company stock	1,680
Depreciation of equipment	750
Repairs to building	500
Taxes	600
Insurance	200
Coal	1,000
Water, gas, sewer and telephone	600
	$7,130
HOUSEHOLD EXPENSES.	
Food supplies for 62 persons	$6,460
Salaries of workers	5,260
Total	$18,850
INCOME.	
Rent of rooms at capacity	$6,240
Board of 47 persons ($5 per week)	12,220
Profit on private laundry	1,500
Total	$19,960
Margin	$1,110

Upon the above calculation, the livery and dairy departments have to pay only for the feed of the stock. At this rate, the dairy alone should show a profit of $1,000 per year. When the purchasing of supplies has been systematized, it is believed that the hotel department will pay a considerable profit upon the estimated food cost.

In connection with the above it is to be pointed out that the chief item in our expenses is that of rent. We shall never be able to prove all the advantages of co-operative housekeeping, for the reason that our location is so expensive. Had our land cost $300 an acre instead of $3,000 (as would have been the case had we put up our own building), our expenses would have been about $1,800 less per year. As it is, it must be mentioned that, in the above calculation, the occupants of Helicon Hall are paying for all the land, while our plan includes separate cottages for those who wish them. By this means we shall make about six acres pay for themselves. Also we may raise the roof of our present building, doubling our present capacity and adding $2,500 a year net to our income.

All these things depend upon one thing — more colonists. We are going quietly ahead with our plans, feeling certain that the right people will find us in the end. In this we labor under one handicap, the seriousness of which it would be idle to pretend that we do not realize—I mean the united power of ridicule of the press of this country. We are making a sincere and serious attempt to solve a problem, the urgency of which is admitted by every one; and, with scarcely a single exception, the newspapers never mention us except with gibes.

I will give you a picture, so that you may see for yourself just how you get your information about us, and judge whether or not the press is giving us a "square deal." The committees have been meeting all summer; and in order to give those who may be interested a chance to discuss their work, a series of three meetings are held in a quiet little hall. There are present say thirty well-dressed and well-mannered people; and there strolls in a dissipated-looking youth with bad teeth and a cigaret in his hand. He is a reporter from the New York ——, he tells us (it is not a "yellow" journal). The subject under discussion is the difference between membership and stock corporations, and the dissipated-looking youth is bored. After ten

minutes he strolls out, and the next day his paper prints a column and a half about the meeting, in the course of which a fat German women is described as shrieking out that she must have sauerkraut, and somebody else as insisting on bringing a parrot into the colony. No such people were present, no such words were spoken—from the first word to the last the account is a *lie*.

Against this we have only one weapon —the facts. It is a beautiful place to live; and everybody is happy and full of good cheer; and it only costs—there is our strong point! We like to get families aside and tell them what it costs. Here is a college professor, for instance —his wife and two children. He lived in a flat with one servant, who did everything, and it cost him $130 a month and all the responsibility. Here in the colony it costs him $105 a month, and he plays billiards every evening as a sign of his emancipation. And here is a young editor of my acquaintance — he has a wife and four children and lives in a little cottage where his wife does all the work. He thought that he could not come into the colony, because it figured out $130 a month, and that was more than his salary. He had to have it pointed out to him that his wife was working sixteen hours a day, and that she might work ten hours a day in the colony and credit herself with $40 a month. And then—to give one instance more—there is myself—formerly the man with the muck-rake, and now an exeptionally competent hotel manager. I have a wife and a little boy, and I can live in the colony for $1,000 a year—but, alas! not with without responsibilities!

P. S.—Since the above was written the first meeting of the children's department has been held. The question proposed for discussion was: When a child wakes up early in the dormitory is it proper to wake the other children, or should the child lie still. After serious debate, Master David (aged five) remarked: "All in favor please say 'Aye.'" Everybody said "Aye."

HELICON HALL, ENGLEWOOD, N. J.

Mary

BY LOUISE DUNHAM GOLDSBERRY

WHAT was the song, I wonder, that sung her Babe to sleep,
What was her young heart saying as she sung:
Did she hear the thorn a-growing, did she hear the winds a-blowing,
Did she see a Cross where cloudy shadows clung?

Was the low, sweet wordless crooning of her lips above his head
But the fringes of that midnight angel-song:
Her heart's unconscious beating starry measures still repeating,
Tho a world's wild footfalls at her door-sill throng?

Ah, 'twas but the mother-babble to the fire-song on her hearth,
But the telling of his dimples and his grace:
How the strange birth-beauty lingers, crumpled petal of his fingers,
Of his eyes, and rosy feet, and baby-face.

Just the wordless song of women babbling sweets unwordable
O'er a witless baby slumbered on her knee:
Just the dew and purple splendor of the mother-passion tender,
The song our mothers sung to you and me.

WASHINGTON, D. C.

The Fur Seal

BY FORBES LINDSAY

Author of "Further America," Etc.

COMPARATIVELY few persons have ever seen a fur seal in life, and yet almost every one thinks that he has done so and that he is quite familiar with the appearance of the animal. This popular delusion is due to confusion of the hair seal with the fur seal. Both are pinnipeds, and that is almost the only point they have in common. In form, color and habit they differ completely, and are not even allied by generic affinity. The hair seal is distributed thruout the salt waters of the world. The distribution of the fur seal, on the other hand, is remarkably restricted. This is accounted for by the fact that it requires a combination of peculiar conditions in its breeding grounds such as may be found, to any extensive degree, only in the Antarctic region. The most essential of these requisite conditions are a low, flat beach, on which the female laden with young can "haul up" easily; a shingly, well drained surface for the rookeries; a cool temperature, with damp and foggy atmosphere, and surrounding waters well stocked with fish.

The west coast of Patagonia, Desolation Island, the Falklands, the Galapagos and the thousand and one uninhabited islets in the southern seas furnish ideal sites for seal rookeries, and time was when tens of millions of these creatures frequented them. Fifty years of indiscriminate slaughter depleted what should have been an inexhaustible source of supply, so that today the number of seals to be found in this region is insignificant and not worth the attention of hunters.

The only existent rookeries of any commercial consequence are those of the two small islands—Saint Paul and Saint George—composing the Pribilov group, and, to a less degree, those of the Commander Islands, Bering and Copper. The future supply, then, of the most useful fur known to civilization, and that most in demand, practically depends upon the salvation of the rapidly diminishing herds that have their birthplace within our territory. The Pribilovs are two volcanic rocks, about thirty miles apart, situated in the heart of Bering Sea. Saint Paul, the larger, is no more than thirty-two square miles in extent. During the breeding season the sun seldom penetrates the dense mists that enshroud the islets, which offer in other respects the conditions of soil and climate sought by the seals.

At the time of Pribilov's discovery, in 1786, the islands were uninhabited, and it is probable that the hardy *stoorman* was the first human being to set foot upon their shores. The Russians introduced natives from Oonalashka and Atkha, and from these the present population of about 400 Aleuts is derived. The lives of these people are literally bound up with those of the seals, from which they derive their food, clothing, fuel and means of livelihood. The Government has wisely secured to them a monopoly of the seal industry on their islands, and the lessees could not improve upon the arrangement, for the Pribilov Aleuts are not only expert in the various processes of land sealing, but also docile, energetic and well behaved. On each island they have comfortable frame houses, a school and a church of the Greek Catholic faith.

The actions of the seal seem to be regulated by a very high order of instinct, and its habits are well ordered and extremely stable. The winter months are spent by the full-grown males in the ocean off the coast of Van-

couver. The females and young males pass the season farther south in warmer waters.

During the early days of May the *sikatchie,* or mature bulls, begin to arrive at the Pribilovs in anticipation of the breeding season. At this time, when covered with the large reserve of adipose tissue acquired in the feeding months, the average specimen will weigh five hundred pounds and measure from six to seven feet in length. The cow is about two feet shorter than this, and has hardly one-sixth the weight of the bull.

For several weeks after their arrival the *sikatchie* engage in fierce and incessant fights among themselves for the choice of stations upon the rookery, proximity to the water determining the desirability of location. In these combats many are killed or maimed so that they die.

The females, having farther to come and being heavy with young, do not reach the islands until about a month after the bulls, who have by this time settled in undisputed possession of their respective stations. Around these males group the cows as they come up from the water, until the rookery becomes one mass of tens of thousands of seals, presenting to the inexperienced eye a picture of inextricable confusion. As a matter of fact, however, each family is segregated and any encroachment upon its privacy is forcibly resented by its head. He does not leave his post for an hour during the entire season, but remains for three months, neither eating nor drinking, but subsisting solely upon the superfluous fat with which he was provided on his arrival. The females come and go freely and frequently. Almost every one of them gives birth to a single pup within a day or two after hauling up on the rookery, and at intervals makes excursions lasting several days into the sea for food. Each little one is dependent upon its own mother's milk for life. The cow seal will not nurse a stranger, and has the remarkable faculty of picking its offspring out of a "pod" of pups that appear to be as like as peas to the human eye.

VILLAGE OF ST. PAUL, CONTAINING THE TOTAL POPULATION (298) OF THE ISLAND.
Killing ground occupies fore part of picture. Buildings along the right front are salt houses, storehouses, etc.

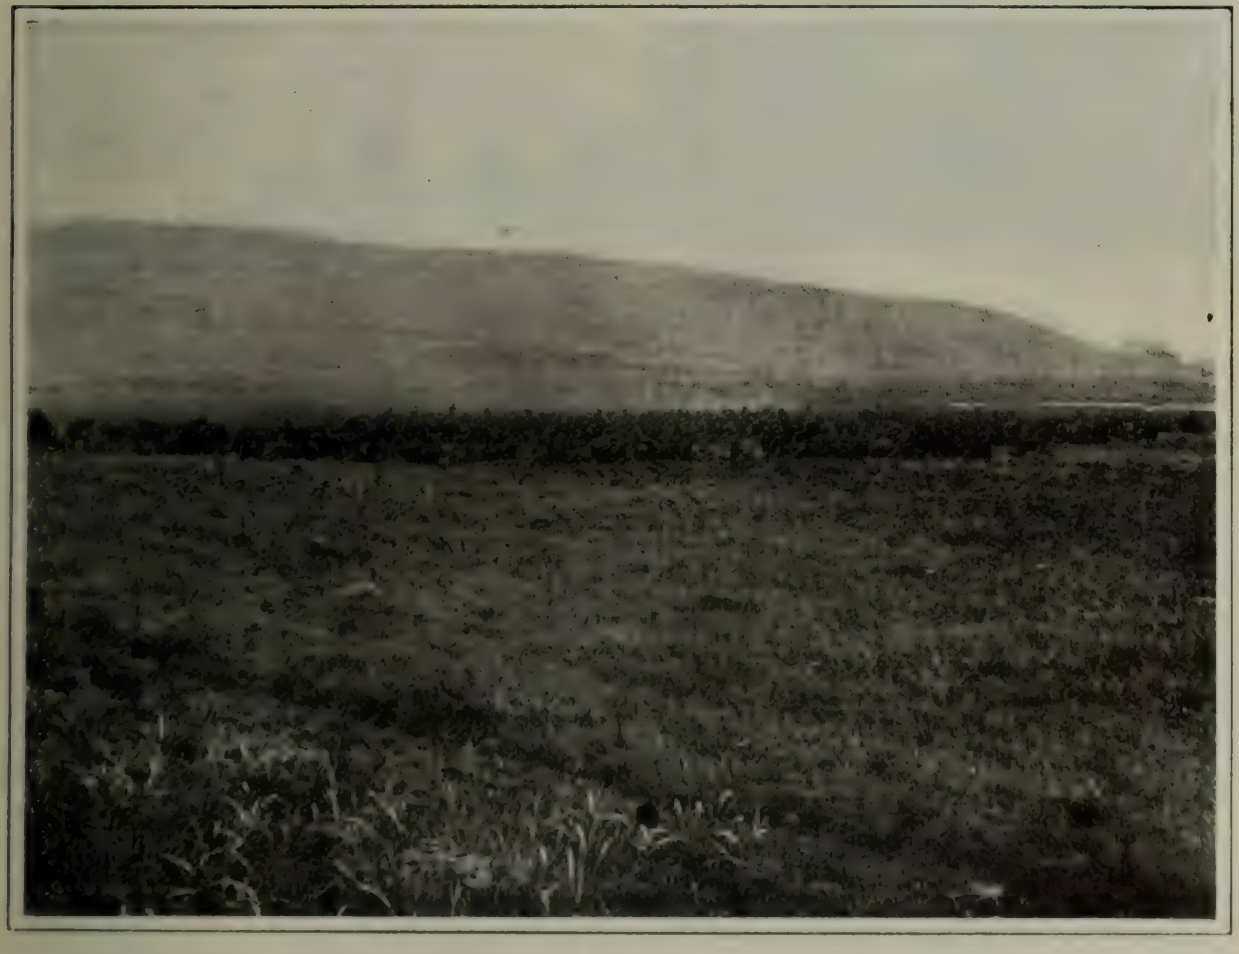
The most important element of seal life on the rookeries consists, however, of the *holluschickie,* or "bachelors," for it is from their ranks that the entire supply

of skins is secured. The fur of the bull after the sixth year is of no commercial value. That of the female is valuable at all periods of its life, but for economic reasons the animal is spared where killing is conducted under scientific regulation.

The "bachelors" are male seals under six years of age, previous to which they do not attain the weight and development necessary to admit of their forcing and maintaining places for themselves among the *sikatchie* on the rookeries. To venture within the area pre-empted by the breeding seals is certain death to a *holluschickie,* and they herd together at some distance from the others.

The bands of "bachelors" are driven by the Aleuts to the killing grounds in the neighborhood of the village, where those between the ages of one and four years are dexterously clubbed and immediately stabbed to death. In this manner 100,000 skins were easily taken twenty years ago, but now the lessees of the islands get fewer than the 15,000 to which the Government at present limits them.

The beginning of August marks the breaking up of the rookeries. The bulls commence to leave, most of them not to come out on land again until the following season, and by the middle of the month they have all deserted the stations they held without a moment's absence since the first of May. The cows now pass longer periods in the water, coming to land only occasionally to look after their pups. Strange to say, these—now six weeks or two months old—are but just commencing to learn to swim. Since birth they have played and quarreled with one another like little dogs, receiving no encouragement from their mothers to do otherwise. Now the comparatively deserted beach gives them ready access to the water and they make their first acquaintance with it apparently by chance. Their initial efforts to swim—in which they have no assistance—are as awkward as those of a human child. Dropped into deep water at this



SEAL FAMILY.
Bull in the midst of females and pups.

time, the seal pup will impotently flap his attenuated tail in the air for a few minutes and drown. For several weeks the pup will continue his patient efforts to secure the full enjoyment of the amphibian life which is his birthright. As their power and agility increase they make excursions, scores of them together, farther and farther from land, until at length they depart at the end of September with the females for the waters of the mid-Pacific.

This brief description of the habits of the fur seal is necessary to an understanding of the problem which has vexed our Government for many years and has reached so acute a stage as to justify the suggestion by the President of so drastic a remedy as the deliberate destruction of the herd. The abnormal state of the Pribilov herd in recent years has produced some modifications of the conditions described. For instance, the grouping on the rookeries is more lax than formerly, and there being proportionally fewer mature bulls, and more available space, there is less fighting among them. It is probable, too, that *holluschickie* are admitted to family relationship at an earlier age—perhaps as early as five years.

The fur seal is one of our great national assets. Since the acquisition of Alaska, the Government has derived a revenue from the lease of the sealing privileges of the Pribilovs amounting to upward of $9,000,000, or more than $2,000,000 in excess of the purchase price of the entire territory. In the same period the trade in sealskins has added $50,000,000 to the value of our commerce, while creating a large increment to our customs revenue on account of duties on manufactured skins imported from London. It is clearly of the highest importance to us to save these animals from extinction as a commercial factor But the matter is of almost equal consequence to England, which receives all the skins and enjoys a rich profit from the

SEAL DRIVE.
A herd of Holluschickie being driven across the island to the killing ground.

ROOKERY ON ST. PAUL.
One hundred thousand or more seals were within range of the camera.

preparation of them for the market. Moreover, as there is no known substitute for this fur, which is in demand all over the world, the question of the preservation of the seals is of actual interest to all civilized peoples.

When Alaska and its insular dependencies came into our hands there were probably 5,000,000 of these valuable pinnipeds on the Pribilov Islands. There was no appreciable diminution in their number until after 1886, when pelagic sealing began to be extensively practiced. In 1891, however, they had decreased, according to the findings of American and Canadian commissioners, to 1,000,000, and experts are unanimous in the opinion that, at the present day, fewer than 200,000 seals make the annual migration to their ancient breeding grounds on our islands in the Bering Sea. This rapid and enormous shrinkage is due to the devastation wrought by pelagic sealers, and the Secretary of Commerce and Labor, in a report just rendered, states that the "herd without doubt suffered more severely from this cause during the past season than at any previous time in its history." The regularity of the migrations of the seals, both as regards time and direction, greatly facilitates the operations of the hunters, who are never at a loss to find them. Sailing into the course of the herd, the vessels lie to and send out canoes, each manned by a rower and a gunner or spearman. No discrimination is exercised in killing, nor is any possible. Conditions are such that by far the majority—probably not less than 85 per cent. of all the seals taken—are necessarily females. In the upward migration to the breeding grounds the cows, being in an advanced state of pregnancy, move slowly and require to come to the surface frequently to rest. After the rookeries have been formed, the bulls, as we have seen, do not leave the land, and the *holluschickie* seldom go to any great distance. The nursing mother, on the other hand, journeys to the cod banks, from 80 to 200 miles away. So it happens that she affords much greater opportunities to the sealer than do the other classes of her species. Since the period of gestation with a seal is twelve months, it is practically impossible to kill a female without destroying at least two lives, and after the 1st of July, three

are almost invariably involved in the destruction, for the unweaned pup, robbed of its mother, will most assuredly die. So tens of thousands of them every year, after bleating piteously for days, give up their lives.

It is agreed on all hands that only a small percentage of seals killed are secured. Some authorities put the proportion at one in ten, and it is certain that one in five is an overestimate, so that if the number of skins taken by the pelagic sealers is multiplied by fifteen, we shall probably have a fair statement of the number of animals killed in order to procure them.

A treasury agent of extended experience, testifying on this subject, said:

"The logs of maurauding schooners have fallen into my hands and they have convinced me that they do not secure more than one seal out of every ten that they mortally wound and kill, for this reason, that the seals sink very quickly in the water. Allowing one out of ten there would be 300,000 that they kill in getting 30,000 skins. Of these killed 200,000 would be females, having 200,000 pups on shore. These pups would die by reason of the death of their mothers, which, added to the 300,000, makes half a million destroyed."

And this takes no account of the fact that practically all the females killed would be pregnant. No less significant is the following extract from the log of the schooner "Angel Dolly," Captain Alfred N. Tulles:

"July 17—Out boats at 10:30 a. m. The seals are around the vessel in hundreds. The boats would not go any distance from the vessel. Had they gone away they would have caught 200 or 300 seals. They were afraid of the fog, yet I told them that it would clear up, which it did at 3:30 p. m. and continued so the rest of the day. They are the hardest set of hunters that ever were in Bering Sea, who caught twenty seals and used 250 rounds of ammunition. They get one out of every ten they fire at. Well, I will never be caught with such a crowd again. The head hunter fired 100 shells and got six seals. The vessel is lying between the islands of St. Paul and St.

KILLING GROUND.
Aleuts ready to skin seals. Women waiting to carry away meat.

George. Just as soon as the fog clears off the land I will have to move, as I might have the cutter after me. I came here to get a load of seals, and by God, if I had any men with me I would get them, too."

"July 21—Out boats at 6:30 a. m., coming back to the vessel at 9 p. m. One boat returned at 7 p. m. This was the head hunter. He is always last out and first back. Caught thirty seals. . . . From the amount of growling among the boat pullers I conclude that they fired at and missed nearly 200 seals. They had 100 shells each when they left the ship, and when they came back all were empty, so they did some tall firing."

"July 26—There are thousands of seals around the vessel. I shot and killed seven from the vessel, but only got one, through the tardiness of the hunters." . . .

The log closes two days later, when the captain was killed and his vessel seized by the revenue patrol.

The greatest damage is unquestionably done in Bering Sea and at the passes of the Aleutian chain. The absolute closing of Bering Sea to pelagic sealers during the breeding season would be a sufficiently effective measure to restore the herd and maintain it in its old time amplitude. Our efforts to secure for this body of water the status of a *mare clausum* were totally defeated by the Paris tribunal of 1893. That body effected some alleviative measures which have proved to be quite inadequate, and are applicable only to citizens of the United States and Great Britain.

At present the pelagic sealers are composed about equally of vessels of Canadian and Japanese register. The Japanese are the boldest and least scrupulous of all seal hunters. They are not amenable to the prohibition against sealing by British and American vessels within sixty miles of the islands, and their operations are only restricted by the three-mile zone of international recognition. This, however, they have invaded on more than one occasion, and in August of the present year a boatload of Japanese raided a rookery on Saint Paul and slaughtered a number of female seals with indescribable barbarity.

It is clear that the settlement of this difficulty is susceptible of but one of two remedies. We must effect a satisfactory agreement with Great Britain, Japan and Russia for the protection of the seals, or resort to the most humane and politic alternative—the destruction of the herd.

PHILADELPHIA, PA.

Reclamation of Swamp Lands

BY HENRY C. HANSBROUGH

[It is well known that Henry C. Hansbrough, United States Senator from North Dakota, and those associated with him exerted great influence in support of the national irrigation policy recently adopted. Much weight should be given, therefore, to his prediction that a law will be enacted to provide for the drainage and reclamation of swamp lands by Federal authority and aid.—EDITOR.]

THE friends of national irrigation have every reason to feel encouraged with the work that has thus far been done under the irrigation law of June 17th, 1902. The dire predictions made by the opponents of national irrigation, to wit: that it would result in largely increasing the products of the farm and thus tend to reduce their value, and that the legislative friends of national irrigation would at once seek to go into the public treasury for money with which to carry on reclamation work thruout the country, have thus far not been realized.

It is true, however, that under the national irrigation law, which appropriates the proceeds from the sales of public lands for irrigation purposes, there is such a field of operation that eventually application will be made to Congress for direct appropriations, but before this happens the success of national irrigation will have impressed itself upon the country so forcibly that I have no doubt the Congress of the United States will yield willingly to any reasonable request for cash appropriations.

It should be understood in this connec-

tion that the moneys which are used in reclamation work, whether they come from the sales of public lands or hereafter directly from the treasury, are to be returned to the Government. It is a mere loan of the Government's credit without interest.

Quite all of the moneys arising from the sales of public lands during the past five years have been apportioned to the different irrigation projects now in progress. I assume that no additional projects of consequence are to be undertaken in addition to those already decided upon, until some of the existing projects are developed to such an extent as to show beneficial results. Those who have had to do with the legislative features of national irrigation are hopeful that there will be no disappointment in regard to returns under developing projects.

The law is very clear in regard to the authority of the Government to recoup itself on all expenditures, and it is the firm determination of those who framed the law that there shall be no disappointments in this regard. Undoubtedly there will be some failures on the part of landholders under the irrigation law to make prompt payment, and while, if the necessity should arise, Congress may conclude to legislate so as to afford relief, such relief would be only temporary. The land itself and not the individual landholder is the Government's security for the collection of the instalment payments. The framers of the law foresaw these exigencies and in the law itself provided against them.

When the waters that are now available for irrigation purposes are fully appropriated, the reclamation service will then bestir itself to seek new sources of moisture for the arid lands, and it is believed that the time is not far distant when some great artesian basins will be tapped and utilized for that purpose. It has been demonstrated that the pumping of waters from our great rivers to be used for the irrigation of adjacent table lands is feasible, and the reclamation service is now engaged in work upon three small pumping projects along the Missouri River in North Dakota. There is scarcely an end to the water in this stream, and while the country thru which it passes in North Dakota is not strictly arid, yet there are seasons when irrigation would be a very valuable assistance in the production of crops, and with the endless quantities of coal along the banks of the Missouri River, the question of fuel with which to raise the waters is already solved.

It is the habit of the American people to move rapidly from one enterprise to another, and therefore it is not strange that we find many people advocating the drainage of overflowed and swamp lands in many of the States thru national assistance. Already numerous bills have been introduced in Congress with this end in view. It is estimated that there are in the United States about eighty millions of acres of swamp and overflowed lands. The drainage of these lands has thus far progressed slowly because of the apparent inability of the several States to do the work successfully. It is unfortunately true that in some of the States where there are swamp and overflowed lands local laws are inadequate. I have in my mind one State where there are a million acres of very valuable land under water. Under the law of that State, drainage boards are organized in the several counties, and these boards appear to be greatly impeded in their work by reason of the fact that the question of drainage invariably becomes a sort of local political issue with one faction of the people in favor of drainage, another faction opposed to drainage, and still another faction hostile toward the drainage board. Wherever these local feuds are engendered, the courts are resorted to, and in the end little progress is made. It must be apparent to everybody that, notwithstanding the constitutional objections of some of the strict constructionists in Congress, there is great necessity for turning drainage work over to the steady hand of the Federal Government, allowing the people interested under local laws to assess the benefits and thus provide the money to be repaid to the Government under the instalment plan the same as under the reclamation law. In other words, the Federal Government can loan its credit, without interest charges, and proceed to drain the lands under a broad and comprehensive system which will accomplish results in the shortest possible time.

It is contended by some that, as these lands in many instances are in private

ownership, it is not competent for the Government to engage in work of this kind. The answer to this contention is that, under the irrigation law, much of the land to be irrigated is in private ownership. The further suggestion may be offered that what the people want is action. They want these lands drained without delay and they are willing to pay their pro rata share of the cost, not that they are unable to pay for the work outright, but that they need that steady and certain hand to which I have already referred, and they do not want any lawsuits or local feuds to prevent the accomplishment of their purpose.

It is an encouraging fact that many Democrats, who have peculiar scruples in regard to constitutional powers, but who, at the same time, have vast areas of swamp and overflowed lands in their States, are in favor of a national drainage law, and I have no doubt that such a law will be enacted and become quite as popular as is the irrigation law, under which so much is now being done to add to the resources of the country.

There can be no question about the future of irrigation in the arid West, and there will be no question about the future of national drainage, if the Government concludes to enter upon it. Both will add wonderfully to the wealth of the nation and make many new homes for our increasing population.

WASHINGTON, D. C.

To Heaven by Private Car

BY BOLTON HALL

AUTHOR OF "THINGS AS THEY ARE," ETC.

"BUT, Saint Peter," protested the Beneficient Millionaire, "I got *my* money in accordance with the law."

"Yes," said Saint Peter, "You've had the credit of that already, haven't you? What good have you done for the love of Man?"

"Why," said the Millionaire, "my donations to the charities—you have the subscription lists—my endowed Chair of Political Economy, the Dives Hospital, the Dives Library—are these not—?"

"I said for the love of Man," said Saint Peter.

"Well, then, if you say solely for the love of man—why, oh, yes. A widow came to me once in great distress. Her son was her sole support; he was about to lose his place for lack of a pair of shoes. I got her the shoes."

Saint Peter pushed a button and an imp of Satan answered. "Where is the boy—Oh, you're the one. This lad," said the Saint to the Millionaire, "went to the devil because he did not get that place as errand boy. You may have done that for love—but you see you only helped one at the expense of the other."

The Millionaire frowned. "I gave $100 to my wife for her Flower Guild work" he said.

Saint Peter turned over his book. "Your wife has the credit for that," he said.

"I paid for free ice once," said the Millionaire, "and said nothing at all about it."

Saint Peter looked at the book again. "That was part of the money you got, by the water works franchise, from the people you gave the ice to, was it not?" he said.

"But the hospitals," pleaded the Millionaire, "and the subscriptions—truly I gave them partly out of kindness. Then the Employment Society that I organized."

"Employment Society," said Saint Peter, "now that's something practical. Did you give the people employment?"

"Well-eh-no," said the Millionaire; "but we found them places."

"Oh," said Saint Peter, "then you only found them somebody else's places—anything else?"

"Well-n-o," said the Millionaire.

"Then you can go to join your friends." Saint Peter opened the gate—the same gate that you would have opened.

NEW YORK CITY.

The Shout for Big Ships

BY PARK BENJAMIN

[Last week we printed an article by Mr. Benjamin under the above title. This week he concludes the discussion.—EDITOR.]

IN connection with the present precipitate demand for big ships for the Navy, with the consequent premature antiquation of the existing fleet, it may be of interest to note something of the conditions prevailing in the Navy as it actually is. Upon the facts adduced conclusions may perhaps be drawn as to whether the headlong building of big ships is really the first and most necessary thing to do in order to increase our naval strength.

As it has become somewhat a fashion lately to meet criticisms leveled at any branch of the national public service with more or less vociferous shouts of "muckraking," it seems desirable at the outset to say: First, that no evidence exists, so far as the writer knows and firmly believes, of any graft whatever in connection with the Navy; and second, that the statements hereinafter made as to the present situation are (with one exception and that noted) all taken from the recent reports of the Secretary of the Navy and the bureau chiefs, and from the printed "hearing" of the latter before the Naval Committee of the House. For the sake of brevity, details are largely omitted, and the subjects have been grouped under their respective headings.

I. ADMINISTRATION: (a) *The Navy has no general staff.*—No military administrative authority under the Secretary to initiate and direct the policy of the department, to co-ordinate the work of the supply bureaus and to ensure effective preparations of the fleet for war. "Unless we are to suffer defeat in its early stages," it is officially insisted, the conduct of a serious war will require such an establishment; also that we should not "wait for the disasters of actual war to provide it."

(b) *The Navy has not practiced and is not practicing battle tactics.*—"Practice and skill," says the Bureau of Navigation, "in maneuvering the battle fleet to an advantageous position are essential if the ability of gun-pointers to hit the target is to be utilized to the utmost. . . . The paramount importance of battle tactics demands any sacrifice to secure and maintain sixteen battleships in the Atlantic fleet," in order that the higher officers "may acquire facility in the exercise of a large fleet and in maneuvering one homogeneous squadron against another"; *but* "the captains and flag officers *have not yet had* that practice and opportunity to acquire skill in handling a large number of vessels." (My italics.)

(c) *The Navy has no Reserve of trained men to join the colors at once at the outbreak of war.*—Every other foreign country having a first class navy has such a reserve. There is, of course, the Naval Militia of the several States, but as to this organization, says the Secretary of the Navy, "so long as it is organized upon its present basis there seems to be no hope that it can adequately fulfill the duties of a reserve."

(d) *The Navy is sustaining severe losses in its trained men.*—It is of very little avail to educate men to high skill as marksmen if we are quickly to lose them, thru the expiration of enlistment terms and refusal to re-enlist. Lieut. Ridley McLean, U. S. N., a competent authority on the subject, announces, in the *Journal of the Naval Institute*, that in the year 1905-6 we lost from nine battleships noted no less than *forty-seven per cent.* of the trained pointers of the 12 or 13 inch guns; *fifty per cent.* of the trained pointers of the 8-inch guns, and *forty-one per cent.* of the trained pointers of the 4, 5 and 6 inch guns. This is certainly a startling showing, and Lieutenant McLean grimly adds: "These men are probably gone for good, and the training expended on them during the last few years was lost just as the ships were ready to utilize their skill in battle practice." What it costs to educate gun-pointers thus fruitlessly may be judged from the amount demanded for the coming fiscal year for target practice, namely, $1,651,058.

(e) *The rate of desertion in the Navy is high.*—The number of deserters last year was nearly one-third as great as the whole number of the new men enlisted in that period. The number of enlisted men in the service is about 32,500, or some 4,800 below the authorized total. Of these, 3,998 deserted, or about 12 per cent. We captured and convicted of this crime only 257. About one-third of the deserters ran away from the battleships and armored cruisers in active service, one-third from the receiving vessels at the navy yards, and one-third from the smaller ships, thus showing a catholicity of objection to all types in the fleet. In the Marine Corps the desertions ranged from 13 to 14 per cent.

II. GUNS AND AMMUNITION: (a) *The Navy has no adequate reserve of guns.*—Last year the Navy Department's estimate for this purpose was $1,500,000, which was reduced by Congress to $750,000. The amount asked for the coming year is $1,396,000 to secure a reserve amounting to only one-fourth of the guns of the present and prospective fleet, up to and including the "Idaho." The Chief of the Ordnance Bureau says "this appropriation is considered absolutely necessary for the efficiency of the Navy." Afterward we are told reserve guns will be estimated as a part of the armament of every vessel, the allowance for reserve being 25 per cent. Is not this a somewhat belated precaution in view of the admissions by the Chief of the Bureau of Ordnance that "trouble is still caused by the rapid wear or erosion of the bores of high powered large caliber guns which will shortly have to be withdrawn for relining"? Bear in mind that, excluding small guns for torpedo defense, the big ships are to have *nothing* but the high-power largest caliber guns. There has always been a dense silence as to the lifetime of these high powered navy guns. Several of them in the past have destroyed themselves and one blew its muzzle off at Indian Head in February of last year, causing the powder charges of all of its type to be promptly reduced, with corresponding loss of armor piercing power. Some tests by the Army people of one of their 12-inch guns made recently, fix its lifetime at but sixty rounds, or, at battle-firing rate, about one hour and a half. Estimating two hours as the time a fleet would take to run by harbor fortifications the conclusion is that "a new 12-inch gun would not last thru such an engagement." The probable self-destroying capacity of high-powered naval guns at their present rate of fire (two shots a minute for 12-inch and four shots a minute for 6-inch, with a near likelihood of this being increased) seems sufficiently great to make a 25 per cent. reserve—even if we had it—look small.

(b) *The Navy has nothing approaching on adequate reserve of ammunition.*—A modern battleship at her maximum rate of fire will exhaust the magazine supply of her main battery in half an hour, and her secondary battery supply will not last much longer. The Navy Department says it is imperative that at the earliest practicable date there be acquired a supply sufficient to refill the main battery magazines of the fleet twice and the secondary battle magazines once. The expenditures involved are stated to be so great that a sufficient reserve to fill the magazines of the fleet once is all that can now be attempted and this one reserve is to cost $9,126,526, of which $2,000,000 was appropriated last year. On the other hand our facilities for getting ammunition appear to be so small that it is officially announced that at the present rate of accumulation the reserve needed to fill the fleet's magazines *but once* will not be completed until 1910.

That is not all. The ships, it seems, cannot carry sufficient ammunition even if we had it. "In the *design* of vessels of the battle fleet, the *space and weight assigned to ammunition has been so restricted* that the ammunition on board, under certain conditions of battle, would be expended in something less than an hour." So says the Chief of the Ordnance Bureau.

And that is not all. We have no way of getting ammunition to the fleet except by the colliers or like vessels "rarely available when needed" and which "cannot carry ammunition in any sufficient quantity." Under existing conditions the Ordnance Bureau Chief announces that he "would be unable to deliver the ammunition at the place needed, that is to the fleet, wherever it may be."

(c) *The Navy has not enough torpedoes to supply even the existing boats, let alone any reserve of them.*—The Chief of Ordnance announces that we are so short of torpedoes that we lack supply for ten destroyers and for six of the large torpedo boats. He says, after pointing out the foregoing:

"When I consider the possible consequences I cannot describe our condition in regard to torpedoes as anything but deplorable. It is an absolute necessity, if we are to be prepared for war, to get torpedoes, for if our torpedo boats can make only one attack (and all of them cannot do that now) they will become useless as fighting machines soon after the opening of war."

Also that

"There exists no reserve of torpedoes, a situation which as long as it lasts means that the torpedo fleet is not prepared for war."

We have no Government torpedo factory, as have Great Britain, France, Japan and Russia. Germany has what is practically one, while the Whitehead Company, in Austria and England, is making and selling to the great Powers about 1,000 torpedoes a year. Our only source is one company, turning out torpedoes "not altogether satisfactorily," as a by-product, with a capacity of but 100 per year. No wonder Admiral Mason calls our situation "fraught with danger." Torpedoes cost now about $5,000 each. We are told that we need 200 yearly and all the facilities for building them.

(d) *The Navy has no offensive mines such as used by the Japanese at Port Arthur, and no large supply of defensive mines for advanced bases.*—Our battleships and cruisers now carry thirteen mines each, merely for self-protection, putting them out when forced to anchor in the vicinity of an enemy, in order to coal or make repairs. It is officially estimated that we need 2,500 mines for use in war, to be accumulated in five years at the rate of 500 per year.

(e) *The Navy has not installed any efficient system of fire-control for its guns, and the ships are accordingly unfit for battle.*—The present system suits the slow rate of fire used a few years ago. Since then we have improved guns, etc., until each gun can fire rapidly and accurately; but the Ordnance Chief announces that the batteries as a whole are inefficient, because we cannot transmit rapidly to the guns the information absolutely necessary to insure accuracy; that the system is not sufficient to permit of control of rapid fire, and that "the ships will not be ready for action until an improved system is installed."

(f) *The Navy has no up-to-date rifles or machine guns of rifle caliber,* and conditions are getting steadily worse. Imagine buying last year 4,000 rifles for the Navy of a type which the Army has abandoned!

III. Repairs, Etc. (a) *The Naval Drydocks are altogether insufficient.*—Battleships require constant overhauling and renewing. So rapid is naval progress that the Chief Naval Constructor estimates that to bring a steel ship up to date after four or five years' service, in addition to the cost of overhauling and repairs, necessitates an expenditure of from 15 to 30 per cent. of her original cost. To refit ships, and especially to clean their bottoms, drydocks are indispensable. The basis of the whole Big Ship argument is the increased speed of the big ships. But how greatly speed may be cut down by marine growths on the ship the fate of both Cervera's and Rodjesvensky's squadrons abundantly testifies. Battleships draw about 27 feet of water. We have now only five graving docks capable of receiving ships drawing 27 feet and over. Five are building and not yet finished. The Chief of the Bureau of Yards and Docks says that "additional docking facilities are greatly needed and would vastly increase the efficiency of the service," and it is pointed out, by way of contrast, that some navy yards in foreign countries have a dozen drydocks, and that England has one yard with nearly twenty docks capable of cleaning a whole fleet in a few days. It is rather significant that he asks for a floating steel dock capable of taking up an injured vessel drawing 37 feet of water, which draft cannot now be accommodated by any dry dock in the United States, and that this dock "would be capable of lifting a ship of 20,000 tons," the size of our now violently advocated big ships.

The foregoing will, perhaps, suffice even without going into the absence of coal-reserve (we are buying "little more

than necessary for use to keep the fleet going") or the lamentable insufficiency of submarines, of which, built and building, France has 89 and Great Britain 48 to our 12, to warrant the question, Is this preparedness of the fleet we have? Remembering that we have thirty-eight millions yet to pay for that fleet, let us sum up this remarkable unbosoming of the highest officials of the Navy Department; no proper military administrative system, with consequent defeat in war openly predicted; no captains or flag officers who have handled or ever had opportunity to handle war vesels in battle tactics; no reserve on which to draw for trained men; more than a million and a half a year spent for target practice only to see the very individuals made expert marksmen by that very practice walk out of the service in disheartening numbers; a high rate of desertion; not even a 25 per cent. reserve of guns over and above those afloat, and the latter of doubtful lifetime; an ammunition reserve, not enough to refill the fleet's magazines once, and yet such a vastly increased rate of firing that a battleship can get rid of all the ammunition it has in half an hour; magazines that do not hold a sufficient supply even if we had it; no way of getting the necessary supply to the fleet if absent from the Navy Yards; so "deplorable" a condition with regard to torpedoes that sixteen large torpedo boats might be useless and all the rest have to scuttle back to port after making but one attack; none of the submarine naval mines which proved so fearfully efficacious in the Russo-Japanese war; an antiquated system of fire-control rendering the ships not ready for action; no up-to-date rifles for landing parties and the like, but instead abandoned army small arms; and no sufficiency of naval dry docks, the most necessary of all means for keeping up the speed—the all important speed we are told—of the ships.

More extraordinary still, altho the great naval powers elsewhere have provided most of these things, and altho their immense importance as affecting our naval efficiency cannot be disputed, no one is demanding that we should exercise any notable precipitation in obtaining them. Unquestionably we shall get them all in time, but the bureau chiefs, despite their emphatic words, seldom insist that we shall do other than string out their acquisition over periods of years. Nor do they waste over-much eloquence in telling us that other nations have or insist upon the *force majeure* which compels us to get the same instantly. That only applies it seems to "Big Ships."

The Mouth of the Lord

BY AMOS R. WELLS

"The mouth of the Lord hath spoken it."—*Isaiah.*

God's mouth, it is a wondrous thing,
As all good folk may see;
It tells the robin what to sing,
And guides the searching bee.

Where morning-glories first unclose
It greets them with a kiss,
It breathes a blush upon the rose,
A balm on clematis.

It thunders to the mountain peaks,
It shouts above the gale,
It prattles to the sunny creeks,
And whispers to the sail.

It prompts the lover's timid tongue
With dear and winsome art.
It smiles the happiest among
Men of a simple heart.

Why, think! what gropings of the mind,
What horror would befall,
Were God a Boundless Undefined,
With not a mouth at all!

BOSTON, MASS.

Literature

"The Virtuous Jean-Jacques"

THIS is the period of the restoration of tarnished historical reputations. The latest celebrity to be rehabilitated is *Jean Jacques Rousseau*,* whose memory certainly stood in need of the service, so far as his personal character is concerned. The reputation of the great Genevese has certainly undergone strange vicissitudes. Lauded to the skies by his contemporaries, not only as a philosopher and thinker, but as a man; remembered with enthusiasm by the generation which followed—that of the Revolution—Mirabeau declaring that he was "a man who spoke as he thought, wrote as he spoke, lived as he wrote and died as he had lived," Rousseau did not become the "great thinker and moral *crétin*" with whom we are familiar until after his death. The attacks made upon his character during his lifetime were generally discredited; it was not until the publication of the so-called "Memoires" of Mme. d'Epinay that they were accepted as true. Since then they have been allowed to stand uncontradicted, nay, unquestioned by all his biographers—by Saint-Marc Girardin in France and John Morley in England. Ste.-Beuve gave this view of Rousseau's character the weighty stamp of his authority in the "Causeries"—in short, whatever the greatness of the thinker and writer, the man had been weighed and found wanting. He stood adjudged a monster of immorality, blackest ingratitude, venomous enmities; a sufferer, also, from the persecution delusion.

Miss Macdonald, whose two sizable volumes will be a delight to the student of the documentary method, whatever may be the measure of his interest in their subject, would have us accept as true the earlier high opinion of Rousseau the man expressed by such eminent witnesses as Bernardin de Saint-Pierre, Mirabeau, Grétry, Mme. de Stäel, Kant and Schiller. Her argument in favor of their view is based upon a fresh examination of the very documents on which is founded the later adverse judgment. The accepted authority underlying all the biographies of Rousseau is the semi-fictional work of Mme. d'Epinay, her so-called "Mémoires," or, rather, the edition of it brought out in France in 1818. It corresponded, in its view of Rousseau, with the "Correspondence Littéraire" of the German Frederic Melchior Grimm, which first saw the light of day in 1812, and with much of what Diderot had said in his "Tablettes." Miss Macdonald singles out Rousseau's English biographer, Mr. Morley, for censure, accusing him, and thru him his French colleagues, of accepting the published version of the "Mémoires" without questioning its accuracy or seeking to establish it by an examination of the original MS. Each new writer on the subject, she says, simply relied upon the thoroness of the work of his predecessors, and produced his own character study of Rousseau by ratiocination instead of by research. His reputation was *chose jugée*.

Miss Macdonald, whose doubts of the correctness of the current view of Rousseau were first aroused in the course of her researches for an earlier work, "Studies in the France of Voltaire and Rousseau," made a pilgrimage to the Parisian library where Madame d'Epinay's MS. is kept, and began to make discoveries, the least important of which was perhaps the fact that the published version takes indefensible liberties with the original, and suppresses the latter part of it, which is preserved in another library in Paris. Far more to her purposes were the changes made in the original draft of the story by the author herself, from notes partly in her own and partly in other handwritings, together with alterations in still another hand, the result being a total reversion of its pen-picture of Rousseau. The conclusion reached by her is that a conspiracy existed to blacken the memory of Rousseau with posterity, a conspiracy whose passive instrument was Madame d'Epinay, but whose active spirits were Diderot and that

* JEAN JACQUES ROUSSEAU: A NEW CRITICISM. By *Frederika Macdonald*. New York: G. P. Putnam's Sons. Two vols. $6.50.

picturesque purveyor of secret information and scandal to the crowned heads of Europe in the eighteenth century, Grimm. The motive of this plot, according to Miss Macdonald, was wounded vanity on the part of Diderot, who himself aspired to be called "the virtuous," jealousy on that of Grimm, who succeeded Rousseau in the good graces of Madame d'Epinay. From this point of view the strongest argument against the reliability of the "Mémoires" becomes its very correspondence with the charges made by Grimm in his "Correspondence Littéraire," and by Diderot in his equally secret "Tablettes," for Miss Macdonald offers, as her crowning proof, among her many facsimiles, reproductions of notes and alterations in the known handwritings of Diderot and Grimm. These two worthies thus craftily prepared, according to her, for the delusion of posterity, three apparently independent sources of information whence to draw the portrait of the moral monster with which we are familiar. At Madame d'Epinay's death the MS. passed into the possession of Grimm, whose secretary, the author holds, made the alterations, probably from dictation, in the fourth handwriting referred to above. The outbreak of the Revolution aided the plot by delaying the publication of the "Mémoires" until after all personal friends and champions of Rousseau had died.

The case, as here presented, bears the stamp of a literary fraud of rare audacity and malignity. Only the main outline of its scope is given in this review. Miss Macdonald presents it ably, solidly based on documentary proof; much of its testimony appears to be unimpeachable evidence, but yet one cannot help doubting if it lies in human nature to withhold revenge until after an enemy's death. However, here we enter the domain of psychology and stray from that of documentary research, upon which Miss Macdonald insists. Her work only opens up a question that may well be taken up with zeal and energy in France. Mr. Morley can certainly not afford to let it pass unnoticed. So far as the impression made by the book upon the present reviewer is concerned, the future of the reputation of "the virtuous Jean Jacques Rousseau" lies still on the knees of the gods.

Japan: In Light and Shadow

THE President of Newberry College enjoyed living several years in Southwestern Japan, where, as a teacher, he came to know fairly well the working of the mind of the rising generation. He discusses Japanese morality in five essays,[1] showing how these people of "powerfully individualistic temperament, impetuous, restive, headlong—Tartar to the very bone," have been trained under the great teachers Buddha and Confucius, and the resultant. Accepting the culture that was offered to them in former ages, they now leap eagerly, and, as it were, by instinct, toward the floodgates of the liberating West. Yet it is evident from Dr. Scherer's pages that they have somewhat of the fine art of the wise householder, who knew how to bring forth from the old as well as to receive the good. He instances the action and the example of the Forty-seven Ronins, who, under the guise of indifference, nursed alike the virtue of loyalty and the duty of revenge. Then, in the nick of time, they struck the blow, delivered themselves up to the magistrates, opening their bowels to quick death, and their names entered the portals of undying fame. In "A Japanese Crucifixion," Dr. Scherer, picturing anew the sacrifice of Sogoro on the cross, who died not for himself, but for others, draws the implied lesson of this vicarious offering. Bushido, or The Warrior's Code, is also analyzed. But while Dr. Nitobe, its great exponent, lays emphasis on the beauties, Dr. Scherer shows its awful defects, its hideousness and its brutality. On the whole Dr. Scherer is reasonable and judicial. He points out the radical defects in systems which heretofore have been accepted as formulating the approved rules of life. Lying, licentiousness, implacable private vengeance, the low estate of woman, have sprung from man's flaming desire to exemplify loyalty—often at the sacrifice of wife, children, truth, purity and minor virtues; or from filial piety, which hesitates not at selling daughters

[1] WHAT IS JAPANESE MORALITY? *By J. A. B. Scherer* Philadelphia: Sunday School Times Co. 75 cents

to a life of shame. Native writers too easily gloss over these black spots or defend traditional ideals. After fifty years of collision with Christian and Occidental forces, Shinto, the tool of statecraft; Confucianism, which is order at the expense of aspiration, and Buddhism, which in Japan is pantheism run wild, are in a state of serious degeneration. Those who steadily read and digest the "Monthly Summary of Religious Literature," in *The Japan Mail,* and especially those who know at first hand native Christians and thinkers, can see a new world of thought in process of evolution. Having virtually accepted our Occidental philosophy, it is, as Aston says, "simply inconceivable that the Christian religion should not follow," with the Japanese. We are not surprised at the author's implied verdict that these people, "schooled in mysterious fashion" for the reception of truth that makes free, are to become the evangelists of Asia.

The people of the Reformed Church in the United States have made of the northern city of Sendai, in Japan, a busy and inspiring center of education. In this story[3] of one of the Christian converts who died too early, we have an invaluable picture of Japanese Christian life, with more sterling information about marriage, the wedding ceremony, child life, toys and home routine, than can be found in larger and more ambitious works.

Clive Holland has made a little book,[4] about as big as a man's hand, richly illustrated with Underwood's photographs, which is full of chat about things and folk seen in Dai Nippon. A pleasant hour may be spent with this author, who touches only the surface of things, but that very pleasantly.

The number of books professing to give glimpses of the Japanese mind and life, or work in the Far East, by persons who may or may not have been "on the spot" is growing to the proportions of a library. In *The Lady of the Decoration*[5] we have what purports to be a collection of letters from an American woman disappointed in life, who goes out as a teacher in a school conducted by missionaries. She is in the country during the years from 1901 thru the Russo-Japanese war. They are, in style and vocabulary, such as one woman would write to another, with enough American lingo and slang to furnish a piquant flavor, especially to English readers; but as far as giving any real knowledge or insight into Japanese life or thought, the alleged original writer, like the unknown editor, "Frances Little," might as well have remained in London or Indianapolis. In this clever novel in outline we see no trace of any acquaintance with real Japanese.

To this day Richard Hildreth's book (published in 1855) gives the best pictures of Japan as seen by the various early travelers, from the time of Mindez Pinto to Ranald Macdonald, the American who first taught English in Japan. Now well edited, illustrated, annotated, corrected and indexed by Prof. Ernest W. Clement, in Japan,[6] it is furnished with a "foreword" by the author of "The Mikado's Empire." The two volumes are notably rich in original documents, and the narrative is woven together with that literary skill and grace characteristic of the noted abolitionist, novelist and American historian.

Recent Critical Commentaries

Professor Swete's *Commentary on the Book of Revelation*[7] is in many respects a worthy product of the best English scholarship. The clear Greek text at the top of the page, with variant readings immediately underneath, the careful comment explaining dark passages in the light of their historical origin and with abundant citation from other apocalypses, unite with the painstaking introduction to give the work substantial character. The book is utterly removed from the half-crazy hermeneutics from which Daniel and Revelation have suffered so much. The time has gone by when it could be said that the "study

of Revelation either found a man cracked or left him so."

Scholarly opinion is now well agreed that the Apocalypse appeared in the last years of Domitian, about 90-95 A. D., that it was a message of comfort and courage to Christians of Asia Minor in the face of persecution, that its figures and images refer to events then in the minds of those to whom it was addressed, especially to the persecutions under Nero, and that the book has no reference to the Pope or the Turks or any other matter of subsequent Church history. This is the view of Professor Swete, who says that Revelation is "the answer of the Spirit to the fears and perils of the Asian Christians toward the end of the first century," and that "no one who realizes that the prophecy is an answer to the crying needs of the seven churches will dream of treating it as a detailed forecast of the course of medieval and modern history in Western Europe."

While thus in accord with scholars of his class as to the principles of interpretation of the book, Professor Swete is more conservative than most recent students as to the unity, literary structure and authorship of the Apocalypse, Since an article by Weizsäcker in 1882 the opinion has gained ground that fragments of older works may be discovered in our text of Revelation, and some have endeavored to trace a process of several revisions, while others have sought to prove that a Jewish book has received a Christian coloring and been embodied in our present Revelation. Both the standard Bible dictionaries could be quoted as against the literary unity of the Apocalypse. Professor Swete, however, defends the older view, and inclines to the opinion that the book as it is came from the hand of John the Evangelist. His explanations of the passages in the text, which look as if several authors, of different times and different religious views, had had part in the writing, are not altogether satisfactory. While the trend of the Apocalypse favors clearly the Domitian date, there are passages which certainly seems to speak of the temple still standing, implying a date before 70 A. D., and the religious tone of many verses would seem to be more Jewish than Christian. As to the authorship, it is difficult to see how one who heard in young manhood the teaching of Jesus could have become so enthusiastic over symbolic numbers and dragons and other like imagery. Final judgment on these matters has not been reached, but in the meantime Professor Swete has made a valuable contribution to the study of one of the most difficult and important books of the New Testament by his thoro and critical examination of its text.

Dr. Briggs's *Commentary on the Psalms*[2] is dominated by the author's interest in their metrical structure. There can be no harm in arranging a Psalm in strophes and lines, if one so desire, but when enthusiasm for meter dictates important textual emendations, as is frequently the case with Dr. Briggs, the matter is more serious. For example, the clause in Psalm 50:16, "But unto the wicked God saith," is called a "prosaic addition," by a "glossator," because it does not fit into the metrical scheme. Yet the clause would seem to be most necessary to mark an important transition in the thought and to bring out clearly the sublime moral teaching of the Psalm. Similarly Psalm 1:3 is called an editorial gloss, because if it be retained the Psalm can not consist of "two antithetical strophes of six tetrameter lines each." But in poetic and religious quality Vs. 3 is certainly not inferior to the rest of the composition.

Dr. Briggs would appear to be somewhat too positive also in fixing the dates of the several Psalms, tho he is inclined to place many of them at any early period. His study of the various texts of the Psalter has been exhaustive, and in comparison of passages in order to secure the exact and full meanings of Hebrew words he has taken infinite pains. In the introduction of this Commentary one may find full information concerning the different translations of the Psalter, the history of critical opinion and interpretation of the Psalms, as well as discussion of the titles, ascriptions, liturgical and musical directions. Besides the general introduction to the Psalter this volume

[2] A Critical and Exegetical Commentary on the Book of Psalms. *By Charles Augustus Briggs, D.D., D.Litt.*, and *Emilie Grace Briggs, B.D.* New York: Charles Scribner's Sons. $3.00.

expounds Psalms I-L, and a second volume will complete the work.

The late Bishop Westcott, who rendered such important service to the study of the Greek New Testament, projected a Commentary on Ephesians similar to his works on Hebrews and the Epistles of John. At his death some five years ago the work was left in a very fragmentary state, and the notes were entrusted to the Rev. J. M. Schulhof, M.A., who has taken much pains to reproduce Bishop Westcott's work on the Epistles[3], but who has not felt at liberty to supplement that work by an adequate introduction to the letter and an analysis of its teaching. The work as it is contains valuable material, but is fragmentary and incomplete.

If so much pains and expense were to be given to the translation and publication of a German commentary on the New Testament, it is a pity that translators and publishers could not have chosen the valuable *Hand-Commentar* of Holtzmann and Schmiedel, or the more recent brief translation and commentary edited by Johannes Weiss.[4] The commentary of Bernhard Weiss is by no means representative of the best work now being done by German scholars. It avoids critical questions, runs over difficulties in an offhand manner, and has no answer to the inquiries which send the modern student to a commentary. It is intended to edify those who are settled in the faith and who do not like to think of problems when they read their Bibles; those for whom the problems exist, and who are perplexed until they can solve them, must seek help elsewhere. Something like a fourth of the page in this English translation is taken up with the Scripture text, the American Revised Version being used. Underneath is the running comment, without discussion of the meaning of words or the relation of clauses, but simple enlargement of the Scripture text with necessary explanation. Professor Weiss is an able exegete, and he has studied the text with astounding diligence. He is fitted also by deep religious sympathies to be a commentator of the New Testament. The meaning of a particular verse he often states with surprising clearness. But insight into the historical processes which gave rise to the New Testament writings is lacking, and one who studies these works of evangelists and apostles in order to trace the life and growth of which they were a part will find little help in this commentary.

[3] SAINT PAUL'S EPISTLE TO THE EPHESIANS. The Greek Text with Notes and Addenda. By the late *Brooke Foss Westcott, D.D., D.C.L.* New York: The Macmillan Co. $2.50.

[4] A COMMENTARY ON THE NEW TESTAMENT. *By Prof. Bernhard Weiss, D.D.*, of the University of Berlin. Translated by *Prof. George H. Schodde, Ph.D.*, and *Prof. Epiphanius Wilson, M.A.*, with an introduction by *James S. Riggs, D.D.* Four vols. New York: Funk & Wagnalls Co. $12.00.

Famous Actor Families in America. By Montrose J. Moses. New York: Thomas Y. Crowell & Co. $2.00.

Not many of the books which have been published about actors have had the interest or the literary merit of a work by Mr. Montrose J. Moses, lately issued under the name of *Famous Actor Families in America*. The three hundred and odd pages of the volume for which we are indebted to Mr. Moses contain valuable and attractive information concerning eight or ten actors' families, more or less American, in which talent, and, in a few cases, genius, has been hereditary. Rarely, of course, has what in the strict sense may be called genius shone with the same power and brilliancy in more than one member of one family. It will suffice, however, to mention the names of the Booths, Jeffersons, Boucicaults, Sotherns, Hacketts, Drews, Barrymores, Wallacks and Davenports (who are all on Mr. Moses's list) to realize that talent, and talent of a high order, has occasionally lent distinction to several brothers and sisters, fathers and sons, or mothers and daughters in America. Perhaps the most remarkable instances of this transmission of talent or genius has occurred among the Booths, Sotherns, Drews and Barrymores. At this moment the names of several of those families are almost as prominent in the American stage world as they were twenty or thirty or forty years ago. If the luster of the Booths seems just now dimmed, it could hardly be denied that Mr. E. H. Sothern and his brother Sam have worthily emulated their gifted

father, the original Lord Dundreary of "Our American Cousin"; while in John Drew, in Lionel and Ethel Barrymore, and others, we have artists of a personality and an ability more than real enough to explain their continued popularity. The importance of the actor and that of the author have largely changed in their relationship to one another during the past century or so. Formerly (and in this country, indeed, till ten or a dozen years ago) the men and women who interpreted a play were held to be of vastly more interest than the poor, underpaid, grubbing writers whom they deigned to illuminate. Now—if we look

ABBOT GREGOR MENDEL.
From Walsh's "Catholic Churchmen in Science." Dolphin Press.

only at the front ranks of the two professions the world over, despite the monstrosities of the pretended "star" system—actors have ceased to be idols, while playwrights are, by persons of intelligence, paid considerable deference. Yet a book on "Famous Playwright Families" would have far less glamor for the general than this ably planned and honestly executed compilation of Mr. Moses. As for "Famous Managers"—well, it is difficult to conceive how anything that could be written about them in their professional characters would sell, however handsomely it might be published, even at a nickel.

The Women of the Confederacy. By Rev. J. L. Underwood. New York and Washington: Neale Publishing Co. $2.00.

The author of this volume was a chaplain and captain in the Confederate Army. The first part contains a "symposium of tributes" to the women of the Confederacy. These vary all the way from the witty compliment of a dying soldier to his nurse to eulogies taken from orations delivered by men of distinction during the past forty years in the South. The second part is especially interesting, since it not only tells of the work done by Southern women in the hospitals and at home during the war, but it contains many letters written by them at that time which indicate their cheerfulness and courage. And these pages, otherwise so sad, are brilliant with a fine and gentle wit, a tender humor which enabled them to pass thru frightful scenes and the most distressing situations with an air so becoming, yet so gayly spirited, that it proves their mettle and quality better than all the talk we hear about their ancestry. The third part contains a recital of their "Trials," and it will harm no one now to read of these, for the story of their sacrifices and fortitude is a rich legacy to the whole American people. The author is an old man. This book is his last labor, and he has taken his time and divided it into as many sections as his admiration for the subject could devise. So that while the first three proclaim the "pluck" of Southern women upon every page, he has devoted the fourth to that distinguishing characteristic in particular. The fifth contains the inevitable defense of "The Cause," which no Southerner can resist making to the utter confusion (in his own estimation) of every one who disagrees with him. The sixth and last division tells of the patience, courage and enterprise these women showed during the Reconstruction period. Much is said about the Daughters of the Confederacy and other memorial organizations in the South which is of local interest. But as a whole the volume should appeal to a much wider circle of readers.

Catholic Churchmen in Science. By James J. Walsh, M.D. Philadelphia: The Dolphin Press. $1.00.

Dr. Walsh meets the charge that the Roman Catholic Church is everywhere and always the enemy of science in the most effective manner; that is, by showing the important contributions which Catholic ecclesiastics have made to science. His aim is to prove

"that the submission of the human reason to Christian belief, and of the mind and heart to the authority of the Church, is quite compatible with original thinking of the highest order, and with that absolute freedom of investigation into physical science which has only too often been said to be quite impossible to churchmen."

It is undeniable that White's "Warfare of Science and Theology" makes a wrong impression from having ascribed too largely to theology that opposition to new and revolutionary ideas which is a common human frailty, and from which even the scientists themselves are not free. To such a view this little book is a useful corrective. The seven names chosen by Dr. Walsh as examples of clerical scientists are Copernicus, the founder of modern astronomy; Basil Valentine, the discoverer of antimony and hydrochloric acid; Linacre, who established the Royal College of Physicians in London; Father Kircher, Orientalist and physicist; Bishop Steno, of "Steno's duct"; Abbé Haüy, the father of crystallography, and, most interesting of all just now, Abbot Mendel, whom our biologists are following instead of Darwin.

Literary Notes

....The Greenwich House Social Settlement, of New York, has done a good service for its neighbors by issuing a *Tenant's Manual*, containing a directory of the libraries, museums, schools, hospitals, savings banks, baths, etc., of the vicinity, and giving comprehensible abstracts of the laws regulating sanitation, child labor, voting, and tenement houses.

...No one could be expected to knock any more loudly on the partition that separates us from the "other side" than the late Dr. Hodgson, who was the secretary of the American branch of the S. P. R., consequently the efforts which Professor Hyslop has been making to communicate with him thru Mrs. Piper have a special interest. He gives a preliminary report of them in the February number of the new *Journal of the American Society for Psychical Research*, New York. They seem to us, like the other Piper reports, to have no evidential value on the question of spirit communication.

....The object of THE INDEPENDENT's Book Lists, which are being printed almost every week in the advertising pages, is to give references to the best books and articles on some topic in which the public has become interested at the time when such information is most in demand. Librarians are nowadays co-operating with the reviewers in the task of separating the wheat from the chaff in current literature. The *A. L. A. Booklist*, published at 10½ Beacon street, Boston, at 50 cents a year, gives a selected and annotated list of the best recent books for libraries of less than 5,000 volumes and more. The Newark, N. J., Public Library has issued a select list of a thousand of the best novels (5 cents), and another containing 1,686 approved books for boys and girls. The Brooklyn Public Library has published a list of over 250 titles on Earthquakes and Volcanoes.

A FINANCIAL BALLAD.

'TWAS payday at the office, and John was coming home,
His loving wife was waiting for him there;
The gas man stood without, and the butcher, short and stout,
Armed with a meathook, swore to have his share;
The milkman with his bell, and the laundryman as well,
Haunted the hall upon that fatal day;
Before the break of dawn John's envelope was gone,
And unto him his Angeline did say:

Chorus.

"I'm yearning for my girlhood back in sunny New Rochelle,
Before them tales of wedded bliss you came round to tell,
I never have a set of furs, nor see no matinay—
You ain't no E. H. Harriman—that's all I've got to say!"

II.

The poor young husband shuddered and mournfully he sighed,
While many a salty tear his eyes did blur;
But, trying to be brave, after he had had his shave,
They ate their humble scrapple, him and her.
Alas! At break of dawn his Angeline was gone—
Gone, like his salary the preceding day;
Pinned on his only coat he saw this tiny note,
Which unto him these tidings did convey:

Chorus.

"I'm yearning for my girlhood," etc.

—*New York American.*

Editorials

Mr. Roosevelt and the Railways

It may be recalled that after the passage of the Meat Inspection bill, Mr. John D. Rockefeller saw a gloomy future for American industry and the export trade. Some time later, the end of the year 1906 being at hand, he had misgivings as to general business in the coming twelve months. Indictments involving a possible imposition of fines amounting to $180,000,000 had then been found against the Standard Oil Company. But the country came to the end of the year without losing its export trade, and general business has not suffered by reason of the prosecution of railway and other great corporations for violations of law. The record of 1906 shows that we have never had a year of greater prosperity, and the country has entered upon the year 1907 in good condition.

Mr. W. C. Brown, the senior vice-president of the New York Central lines, has written a letter about the railroad business. It was addressed to a friend in Washington, was shown to President Roosevelt, and has since been given to the public. He speaks of "the apprehension and alarm which are spreading all over the country, based upon the fear that there is a definite, deep-seated prejudice against railroads as such, which makes investments in them so hazardous as to prevent prudent men considering them." "I do not think," he also says, "that you or any other man of ordinary prudence would for a moment think of investing money in a business against which every man's hand, from the President's down, seems to be raised."

When the New York Central was indicted and convicted and fined, not long ago, it did not thus suffer because the hand of the President had been raised against it. The company and its responsible officers, one of them a vice-president (it was not Mr. Brown) had violated the law. The offense, Judge Holt said, had been "in its essential nature a very much more heinous act than the ordinary, common, vulgar crimes which come before the criminal courts constantly for punishment, and which arise from sudden passion or temptation." Mr. Brown must know that the punishment of his company was deserved. He must also know that the prosecution of railway companies for deliberate violation of a just law does not indicate the existence of "a deep-seated prejudice against railroads as such." As well might we say that the people of a community can entertain such a prejudice against their wagon roads because travelers have been robbed on them. It is not true that the general business of the country can be injuriously affected and its prosperity checked by the prosecution of lawbreakers, whether these be railway corporations and railway officers or persons having no corporate affiliations.

For some weeks past there has been speculation in the press as to the President's policy concerning additional legislation for the regulation of the railways. At the same time he has been urged, directly and indirectly, by the representatives of large corporate interests to go no further. The arguments of those who would have him turn away from railway questions are based upon an assumption that what he has already done has been injurious to public interests, and that what he may intend to do will be more harmful.

But what he has done, with the help of Congress, has been simply to insist upon "a square deal," as he would say, between the railways and the public, to enforce laws which have been continuously and shamefully violated, and to procure the enactment of new laws in the interest of common justice. How could this be injurious to the American people or be harmful to any honest undertaking? Why should honest men object to the enforcement of laws which require fair dealing in railway charges, or to the making of new statutes designed to prevent injustice and discrimination in freight rates?

And if it be true that he intends to recommend, a few months hence, legislation for ascertaining the actual value of railway property, and to ask that measures be taken to prevent over-

capitalization and stock watering, where is the harm in that? Why should not the American people be informed by official authority as to the sums that actually have been invested in the railways, or the values which the railways now represent? Why should not the watering of railway stock for the benefit of speculators and the masters of railway intrigue be prevented? Is there anything in a movement for such an inquiry and for such restrictions that will harm honest men or cast a blight upon national prosperity?

The exceptional ability of our captains of industry in certain fields of activity is beyond question, but many of them are strangely blind to the effect upon the American public of the results of recent official and unofficial inquiry as to their own methods or the offenses of corporations which they control. In the disclosures attending the Harriman investigation is seen the latest proof of this. Only by that effective and just regulation which Mr. Roosevelt aims to secure can the railways of the United States be retained in private ownership. Those who urge him to discontinue his efforts to obtain it are unable to see that he and his policy are really their shield against the wrath of the people.

Ecclesiastical Honesty

We are not surprised that those who are shocked at the hypocrisy they find in the reticence of "An Undistinguished Heretic" form the great majority of those who have written to us about his "Confessions" in our issue of January 10th. His concealment of his actual beliefs or disbeliefs, knowing that his frank utterance of them would disturb his people and very likely make him lose what those in labor unions would call his "job," was on the face of his story, and that could not but raise the question of his honesty, and had, indeed, evidently raised it in his own mind. And yet he seemed to have settled this question seriously, without evasion, to his own conscience, altho he did not explain why and how he could remain a teacher of religion in a Church, the fundamental articles in whose creed he denied in secret.

A question of casuistry is a question of duty; and a question of duty is higher than any other. It can hardly be otherwise than that his answer to the question whether his reticence is hypocrisy, not to say the sin of the traitor Judas, as some of his respondents declare, depends on what he believes to be fundamental in the Christianity which it is his duty to preach.

What is fundamental? Is it character, or is it belief? Is it to be like Christ, or to believe certain facts or statements as to who Christ was before or after his birth? Is it to hold the exact truth of philosophy or biography, as angels and devils know it, or is it to be like angels and not like devils? We presume that the "Undistinguished Heretic," who has no ambition to be an extinguished heretic, puts the question to his mind in this way, and answers it in favor of the character of the angels and not in favor of the devils who "believe and tremble." He holds that Christian character is fundamental, not belief about Christ. He therefore holds that he is justified in regarding the statements of his denominational creed as incidental, valuable, important, it may be, but vastly less important than Christian character. He would say that Paul has nothing to say about the virgin birth, but much to say of that love which is more than faith or hope, and which Christ declared to be the whole sum of the law.

But it is somewhat against his purpose to call up Paul; for, if Paul had nothing to say of the Virgin birth, he had much to say of the resurrection, and he even declared that without the resurrection his preaching of Christ were vain. Paul believed in Christ as a risen, living Savior, for he had himself seen him in a blinding vision. On that vision of the living Christ he based his conversion and faith and preaching. His idea of Christianity was not merely the doctrine of love taught by Jesus, and the character which Jesus lived and preached, not simply the spiritual nature of religion as against ritual formality, not merely that the kingdom of heaven is righteousness and peace and joy in the Holy Ghost, instead of eating or drinking this or that; but Paul also held the actual resurrection of this Jesus from the dead to be of the

essence, because it was the impulse, of all his preaching. Here our "Undistinguished Heretic" would seem to differ somewhat from Paul, and to be satisfied with the teaching of Jesus himself as to the proper relation of man to the Heavenly Father and to his neighbor.

And yet we do not understand that our "Undistinguished Heretic" disbelieves in the heavenly existence of Jesus, whom Paul saw in vision. What he does not believe is that Christ's resurrection was physical, of the body, on the third day. All the evidence he finds of the risen Christ is that of visions, not of actual physical sight. Out of those visions have come, he holds, the legendary stories of physical resurrection. So he preaches the future life, as Paul taught it, but on other grounds—whatever they may be—of immortality.

Of course, our "Undistinguished Heretic" is right in holding that religion, and the Christian religion, is mainly a matter of character and not of creed. For that he plainly has, as every one admits, the support of Paul and James and Christ himself. One has all that is best in the Christian or any other religion who is like Christ in character, and who, like Christ, looks up to the Heavenly Father. That gives both character and faith. But our "Undistinguished Heretic" is not only a teacher of Christianity, but he is a member of a Christian sect, and that may complicate his duty.

Let us suppose him to be a Presbyterian, as he may be, for his sect has a formulated creed which he disbelieves, but does not publicly flout. When he was ordained he answered affirmatively the following Presbyterian question, or one like it:

> "Do you sincerely receive and adopt the Confession of Faith of this Church, as containing the system of doctrine taught in the Holy Scriptures?"

To be sure, he made no such acknowledgment when he was transferred to another church, but his status as a minister rests on this basis and acknowledgment.

Now it is his business to understand whether this relation of the minister to the Creed is of acknowledged force or not. In the Episcopal Prayer Book there are "Thirty-nine Articles," set forth as the basis of belief, but nobody pretends to believe them. They are distinctly Calvinistic, while the teaching of the leading theological seminaries for more than fifty years has been definitely Arminian. But in the Presbyterian Church there is an effort to keep the Creed in active use, and it has lately been revised, and a new Creed has been formulated. It seems only fair that those who occupy the Presbyterian ministry should at least hold the more prominent doctrinal statements in its shortened Creed. If they connot hold them it would seem to us their duty to remember that they are not preachers in a general Christian Church, or in a creedless sect, but in a sect which has a formulated Creed, for which, in its essential parts, they are held; in fact not merely those essential to Christian character or sonship to the Heavenly Father, but those essential to the type of theology related to philosophy and biography, which that Creed has formulated. And if that be the case it would seem to be the duty of the minister who is thus out of harmony with the creed to allow the facts to be known, quietly, unostentatiously, to his brethren of the ministry, who are responsible for the purity of creed, and to let them take the responsibility of deciding whether his divergence is of real importance. Meanwhile he should go on preaching Christian life and character and hope, discipleship of Christ and trust in the Heavenly Father, without stirring up theological dissensions in the church to which he ministers, and without spreading the heresies which he thinks so unimportant.

Such would be our advice, for we do not take it that any gadfly is pursuing him to become a new Luther and reform the theology of the Church.

Learning to Fly

"And man shall learn to fly." This sentence, written backwards with the left hand so as to be read only in a mirror, is found in one of the most remarkable books of the world, the notebook in which Leonardo da Vinci secreted his daring thoughts. He was a visionary in the best sense of the word, but not credulous. The seekers of perpetual motion,

the makers of gold and the evokers of spirits he attacks with sharpest criticism and ridicule. That he had a real insight into the difficulties of the problem of aeronautics, he shows when he says that the reason why man cannot fly is not because he has not the wings of a bird, but because he has not the soul of a bird. He could make wings, but the delicate art of balancing for every variation of wind and motion he must learn as the birds learn it.

And now, four centuries later, we have arrived at a point when the obstacle foreseen by Leonardo blocks our way. We can make aëroplanes, as large as we like, and the gasoline engine gives us a light-weight motor powerful enough to run wings or wheels, but still man cannot fly, because, as Leonardo quaintly put it, he has not acquired the soul of the bird. The art of aviation must be learned, and we direct the attention of our athletic youth to this new and profitable outlet for their superfluous agility and daring. The cause has had a sufficient number of casualties from Icarus to Lilienthal to make it attractive as a sport. It is perhaps as easy as riding a bicycle, but mastering of the bicycle would have been long retarded if every time the rider lost his balance he would fall fifty feet and smash the machine. It is like learning to swim without being able to float.

It is only five years since one of the foremost of American scientists, Prof. Simon Newcomb, declared that

"The constitution of an aerial vehicle which could carry even a single man from place to place at pleasure requires the discovery of some new metal or some new force";

a passage that is likely to be quoted in the future as often as the similar mathematical demonstration of a British scientist that no ship could carry enough coal to propel it across the Atlantic. The experiments of the Wright brothers, Santos-Dumont and Dr. Bell have already proved that the airship without a balloon is a possibility, and we can confidently expect it to become a practicability in the near future. Still, Professor Newcomb's reasoning was good, and points out the real difficulty in the making of large flying machines, which is that there is a natural and inevitable limitation to the size of a machine or structure of any particular form. If anything gets too big it is bound to break down.

For example, a log will bridge a small stream, and if we want to span a wider stream it is only necessary to get a bigger log. But we cannot go on indefinitely making longer bridges with larger logs, because the weight of the log increases as the cube, while its strength increases only as the square. If the log is made twice as big all around it has four times the cross section, but weighs eight times as much. So, by and by, we get a log so long that it breaks from its own weight, and we have to stop using logs, not because they are too short, for we can splice them, but because they are too heavy. But we can bridge still wider streams if we use a hollow log, which is stronger for the same weight than a solid log. When we have reached the limit of the tubular bridge we can go further by splitting up the log into timbers and making a truss out of them. The self-supporting truss of any particular form also has its limit, but we can use a stronger material such as steel, where the cube will be slower in catching up with the square.

The same law applies, of course, to living machines. A Brobdingnagian giant could not stand up on this earth. The mammoth and the dinosaur approached too closely the economical maximum in size and became extinct.

In creatures that fly the practical limit is still lower, probably not much over thirty pounds. The moa and the ostrich passed it, and long ago gave up trying to use their wings. The maximum weight of the vulture, the condor and the albatross is about eighteen pounds. So far as we know the biggest of all winged creatures was the pterodactyl *Ornithostoma*, which weighed about twenty-five pounds and spread its wings twenty feet. But this flying reptile, altho it was admirably constructed with tubular wing bones as thin as paper at their tips and doubly braced against the backbone at their point of attachment, has long since been relegated to the dusty shelves where Nature stores the models of her primitive inventions.

As long ago as 1680 Borelli demonstrated mathematically that man could not fly even if he had wings, no matter

how long they were or how well muscled, simply because he is too heavy. This does not exclude the possibility of aërial locomotion by artificial wings and motive power, but still man is not relieved from the restrictions imposed by physical laws. An aëroplane to support one or more passengers and a powerful engine must be very large and be continuously driven at a high speed. This makes the art of learning to fly difficult and dangerous. Dr. Alexander Graham Bell has an ingenious method of evading the law, which he describes in the January number of the *National Geographic Magazine*. Altho there cannot be a bird so large as the roc that carried Sindbad into the valley of diamonds, yet it is conceivable that a number of smaller birds, such as the albatross, could be harnessed together in such a way as to give man a ride in the air. This is the way Dr. Bell has solved the problem. Instead of one big kite he ties together 1,300 small box kites, each weighing half an ounce, and made in a tetrahedral form to obtain the maximum of strength and lightness. He finds that this compound kite is strong enough to carry a man, is very stable and can be flown in a light breeze. Such a flying machine could, therefore, be kept in the air by a lower velocity and consequently smaller engine than the wide aëroplane, and so would be safer and more suitable for this transition period when man is learning to fly.

Love-Making on the Stage

THERE can be no particular objection to *saying* love, line upon line, upon the stage, but we should draw the curtain upon *acting* love upon the stage. It is a sort of blasphemy against the innocency of young natures. It destroys the first illusion of love, steals it from people so young that they have never enjoyed it for themselves. And it reveals this mystery of love, vulgarizes it for them to see it dramatized by a painted woman and a painted man before the footlights. There is a virgin sense in boys as well as in girls that is outraged by the embrace and kiss of lovers in a play. And that which offends them is neither the kiss nor the embrace, but it is the publicity of the act. They do not think of the art by which passion has been counterfeited by two persons who do not feel it, but they feel quickly and instinctively that a mockery has been made of something sacred, and that something which is by nature private has been degraded by the showing of it nakedly to people who had no real right to see it. Young people are not only innocent, they are moral till they learn immorality by suggestion or observation. That is where the trouble comes in, not only thru the new scientific method of teaching "sex" to children, but the betraying of love to maidens and youths. They get a secret which does not yet belong to them, and they solve it more or less to their damnation too soon. Therefore, every one of them who sees the physical ardor of love on the stage has not only been robbed of the dearest wonder that belongs to awakening youth, but he has been wronged by art and civilization. That is to say, the vehicle of expression for what in him would have been a delicate and sacred emotion has been cheapened and even rendered ridiculous. After seeing love acted a thousand times by a class of people who, whatever may be said of them individually, do not stand in the order of things for morality, love cannot seem as important nor as pure as love really is.

And it is of immeasurable importance that we get our first knowledge of love from the right source. It should come to young people from each other, sanctified by the privacy of one personality. They should get the sense of it in different surroundings, by the fireside of a home, in the innocence and gayety of open fields, or in the sweet privacy of green lanes—not from across the footlights of a stage, from a heroine who is to be seduced by her lover before the play is over. A kiss stolen by a boy from a girl beneath a hawthorn hedge is not nearly so damaging to morals as the thoughts and speculations that may come to them from witnessing a play with a pretty fallen woman in it, whose disgraceful predicament appeals to the audience's sympathy in the end as much as her love affair amused them in the beginning.

And, finally, young people who see so much love made on the stage are not so

apt to enter into competition by making love to one another. They feel the amateurishness of their own efforts by comparison; or, worse, they try to model courtship unconsciously upon the theatrical idea of love. And in either case the results are not satisfactory.

Now what we need is more real, heart-singing love-making. Then we should have more ideality, more poetry, more art in life. For it is the happy inspiration from which the right kind of generations spring. It is the very private interchange of beautiful scriptures between men and women which results in marriage and offsprings with spiritual capacities. The fact that not enough of it is made now may account in part for the unscrupulous, unsentimental quality of intelligence in the present generation. Too many of the poor young things have been born of marriages where love was not the determining ecstasy. They think that they belong to a new order, because they have so few illusions. As a matter of fact, they are chill young souls, wingless and web-footed, still-born to heaven, because their parents did not love enough to make them whole. Otherwise they belong to the same old order.

This is a theory, of course, but it is harmless, and should be the more easily granted when more damaging ones are accepted so quickly. And, granting it, the conviction follows that the stage injures the moral nature, discourages the right kind of love-making, destroys the innocency of sentimentality in the young, all of which is bad for prospective lovers, and therefore bad for everybody.

The French Church Compromise

It was a great surprise to the French Government, to Premier Clemenceau and M. Briand when the Catholic bishops presented their proposed compromise, which had already been approved by the Pope. It came just as the Assembly, by the immense majority of 550 against 5, was voting a third law for the relief of the Church. Under the new bill, those who wish to hold meetings are not to be required to make notifications of intention; various restrictions under the old laws are removed, and the mayors are required to place the existing meeting places at the disposal of the worshippers. It is clear that the intention of the series of laws is not, as charged, to destroy worship and faith, but to provide that the churches may be held, as always, for the worship of the faithful.

We have not yet the full text of the bishops' new proposition of compromise. So far as cabled it asks that the Government, by law, shall provide that the churches, owned by the nation or the communes, shall be rented for a period of eighteen years, under a renewable lease, to the bishops, or to the associations created by the bishops, and that this shall be made uniform over the whole of France. Only the bishop shall be in control and possession, and no possible divisive body of laymen. If the Government will grant this, the Pope will give his unwilling consent to the French legislation separating Church and State.

We do not care to go into any discussion as to the propriety of this demand, or as to its acceptance, until we can see its text in the French papers. We judge that it may be the basis of an accepted compromise, inasmuch as M. Briand, who is chiefly responsible, is clearly desirous of coming to some acceptable conclusion. But Premier Clemenceau calls the bishops' proposal an "insolent ultimatum," and his speech very nearly led to the resignation of M. Briand. What the bishops' proposition requires seems to be little more than was quite possible to accomplish under the Separation Law, which allowed the bishops to create the associations which would hold the ecclesiastical property; and, indeed, such a plan was devised and approved by a large majority of the bishops, but was vetoed by the Pope.

The matter in all this which strikes the American outsider is the absolutely autocratic character imposed on the Catholic Church in France. The people have absolutely no authority and no voice. Everything rests solely in the Pope. The Pope, by his sole authority, appoints the bishops, and the bishops, under him, control absolutely the priests and the people. They have no rights, no will, that cannot be reversed by the bishop—that is, by the Pope. The constitution is that of an absolute monarchy. It puts the Church into a position antagonistic in its nature to that of popular government. It is no

wonder that the leaders in the Catholic Church in France have been opposed to the Republic, for its democratic principles are the reverse of the principles under which the Church is governed. Here is the explanation of the feud between the State and the Church. It is not Christianity at all, but ecclesiasticism, which the French people are hostile to, because ecclesiasticism is not democratic. Pius X is as consistent as was Pius IX; but Leo XIII was not consistent—only wise—when he besought the French Catholics to stand by the Republic; but they, consistently, refused. The proposed compromise, approved by the Pope, is one which requires the Government to recognize, confirm and maintain the Papal autocracy in the French Church. This may be done, but it will be at the request of the French bishops, and not at the demand of the foreign Pope, however the French bishops may subordinate their action to the requirements of the Pope. And if they yield, it will be with the expectation that not even the Catholic Church can remain long under a constitution which gives the laity no rights, no authority even to hold church property. Aristocracy was no part of the constitution of the primitive Church; and it is a belated characteristic of the Roman Catholic Church as defended by the Ultramontanism just now in control.

Look Ahead

THE years move fast, but events faster. The age is electrical in its moral as well as in its physical speed. 1906 had an accelerated movement beyond that of any of its predecessors. The outlook ahead is as revolutionary as have been the achievements behind. Industrial co-operation has become the order of the day. It is almost certain to be greatly advanced in the immediate future. Co-operative stores and banks do not suit our American temperament, yet co-operation covers a large part of agricultural enterprise, and does it very naturally. It manages every department of dairying, and is rapidly taking hold of the marketing of farm produce. This drift is socialistic in the true sense of that word. The next movement along this line is likely to be postal savings banks and co-operative State insurance. The State is also very sure, soon, to stand for a pensioned old age. We have proved our ability to pay annually about $150,000,000 for war veterans. Childhood receives a State school system and increased protection; but old age has just as good claims upon us as it approaches second childhood. The English Government has committed itself unreservedly to old-age pensions, and the French Government stands pledged to the same principle, while Germany shows no signs of retreating from its compulsory system of insurance for old age.

We shall not deserve nor claim the rank of prophet for foreseeing a larger degree of public ownership of public utilities. Municipal ownership is, wisely or unwisely, to be tested. In this country as surely as in Europe. To class this as socialism need not terrify us, since it can, at the worst, be no more socialistic than public ownership of the highways and the common schools. It is not impossible that another struggle of operators and miners will compel the people—that is, the consumers—to assert their rights over the great carrier system and even the coal-beds themselves.

Whether party policy is able cheerfully to grant a modification of existing tariffs or not, it is quite certain that the people has made up its mind that the war tariff must come down. The unbalancing of industries, by protection to one branch of national effort, is always unsafe. President McKinley, in his great and last address, enunciated the new doctrine that the time had come in American history when foreign trade must gage our legislation, rather than the home market. He told us that commercial warfare must cease all over the globe, and the civilized nations must learn to co-operate. Politicians who cannot look over the machine will find it impossible to readjust their thinking to this new principle; nevertheless, we believe it will dominate the growing internationalism. It will not be possible much longer to retain a question of this sort in the schedule of party politics, to be decided upon by a caucus.

That we are bound to see a greatly accelerated movement toward country life is demonstrated by the history of the

last ten years. The reversal of the drift toward congested population began as long ago as 1890. It has already lowered the ratio of population that settles into towns over one-half — probably nearly two-thirds. Deducting the one million of foreign immigration, that adds itself to our population annually, the ratio toward country living would preponderate much more largely. The outlook is toward a suburbanism that will almost cover the whole country. The development of electricity as a motor force sends the trolley into our most remote districts, abolishing isolation, and equalizing the privileges formerly belonging to the city alone. The agriculturist of today has the advantage in every way over the manufacturer. He can live among the trees, and by the streams, while the mail is daily dropped at his door, and the telephone links him to his neighbors as well as to the market.

The churches have come under centripetal influences that are not likely soon to be exhausted. During the last twelve months this has created an affiliation between sects presumed to be hopelessly alien. The fundamental reform, however, is not likely to satisfy itself with merely breaking down barriers. We have something else to do before we shall see the country churches rebuilt and the city churches refilled. May not the church building of the future be placed on a business basis, so that church affairs will be carried on without resort to trivial entertainments? We have already a few such churches erected, in which the rental of offices adequately covers the institutional needs of work and worship.

It is in our school system, however, that we have marked the most distinct evolution, while it is there that we may anticipate the most constructive efforts in the immediate future. We have, until very recently, aimed only at creating the individual; we are steadily modifying our State system of education toward the creation of wise citizenship. The power of the State to create national sentiment, and enable the whole people to act unitedly for one political or ethical end, has been illustrated by the Japanese. War is robbed of its worst features when a people can, thru it all, count certainly on every soldier's temperance and humanity, as well as his patriotism. The level of human purposing has, of late, been distinctly raised, as in the seventeenth and eighteenth centuries it was raised by the Puritans. We have now to aim higher, not only as individuals, but as peoples. Our public school systems must of necessity determine public morals as well as increase private knowledge. They must make the nation as well as its units.

The era of applied learning is also upon us; and while only a part of our schools have as yet become readjusted to the use of books as secondary to the study of Nature, the garden school and school gardening are rapidly becoming accepted principles. We may confidently expect, before long, that at least one-half of each day's schooling will be out of doors, in direct contact with things, instead of books. The training of the hand is sure to be followed by the training of the whole body. The principle of stuffing a child with information will pass away in favor of leading the child in paths of independent investigation. Much that has passed for acquirement or accomplishment is lapsing from the curriculum, while more emphasis is placed upon skilful doing. Industrial efficiency is sure to be recognized as fundamental to a real education. We must get rid of that conception of education which leaves careless workmen and ignorant mechanics, farmers, merchants or craftsmen who do not understand the very best possibilities of the industries in which they are engaged. The home and the school are rapidly becoming co-operative institutions, if they are not to be entirely merged in their work.

Of great industrial enterprises of which she shall hear more in the immediate future one of the greatest will be an interstate waterway uniting New York with Chicago and thence down the Mississippi Valley to New Orleans. This has already become an absolute necessity, to prevent a vast waste of power in readjusting our whole shipping interests—a readjustment which will astoundingly affect New York and other great commercial centers. In obedience to this developed waterway we shall see the ships of the Great Lakes passing thru canals without breaking freight, and during a part of the year doing their work upon

the ocean. It has been demonstrated already that no possible railroad system can accommodate the increasing productivity of the vast Northwest. Of almost equal importance will be the railroad destined to run down the spine of the American continent. Some of our young folk will live to take their vacation outings at Valparaiso or Quito. The hills of the Northwest are well punctured with iron highways, opening immense wheat fields, where we looked only for furs; and the enormous arid area of the Southwest is by the same means becoming one vast garden and orchard. Even more important is the fact that the Southern States are taking the lead in manufacturing interests as well as in agricultural products. Florida, nearly as large as all New Engand, offers a vast winter retreat, where the Northern farmer, after seven months with his dairy or in his wheat field, may go to spend the other five cultivating loquats and oranges. The Great Lake system has heretofore been the only center of American internal commerce; the Gulf of Mexico is now becoming an American Mediterranean.

A Treaty with Japan

It is almost humiliating, but a necessary result of our excellent system of independent State governments, that before we can make a treaty with Japan we should have to ask the permission of the Mayor and the School Board of San Francisco. It is still further humiliating that, at the command of selfish and prejudiced ignorance in San Francisco and California, we should be driven to ask Japan to consent to a treaty excluding the admission to our shores of laborers from that country. Yet this is just what we now see. The delegation of those who have made the mischief has been invited to Washington to consult with our Secretary of State, and the San Francisco Mayor and concert-hall player, who by grace of Ruef has his office, will magnanimously consent to let the Japanese children back in the public schools if the President and the Senate will agree to a treaty excluding Japanese laborers. This is no grim joke, but the grim fact, and it is not true that the universal sentiment of California is with Ruef and Schmitz. The religious papers of California have distinctly protested that such is not the position of their supporters.

A Mischievous Scare

For some weeks the report has been somewhat sedulously spread abroad, particularly in naval circles, that there is danger of a war with Japan, a war which is likely to find us unprepared. Such a war, it was said, is really imminent within a few years. There is a purpose in the scare, and that is to get Congress to make heavy appropriations for big ships—a fleet of "Dreadnoughts." Such a diligent report is recklessly wicked. Nothing could more lead to accomplishing the event. But there is absolutely no real reason for expecting war over the present school difficulty in San Francisco. And if there should be war —which there will not be—Japan could easily take all our island possessions in the Pacific at any time within the next ten years, whatever we were to do in our shipyards. That is the cold fact, and it does not frighten us. Japan would hardly attack our coast, altho she could bombard our coast cities if she chose. Her policy is to do her fighting near home, and we have no desire to go abroad to fight. To foment ill will and prophesy war is utterly detestable, and it is for a bad cause. As to big ships, we have reached the extreme of heavy armor, bulkiness and big mark for an enemy's guns. Every new device has been piled up in the new, tall warships, and no one knows what would happen in actual war, except that it would be easy for a shot to find them, and no one knows what delicate electric machinery it would smash. We have gradually gone far from the wise monitor type, which gave us as nearly a submarine as possible, with nothing to be hit but a round tower, and it is time to go back to a low freeboard, and towers which no marksman could hit at the distance of miles.

The American Peril

In a letter to the London *Times*, Mr. Alfred Mosely gives some conclusions from his late visit to the United States, and says that perhaps the greatest danger to America's future rests in the high standard of living and the reck-

less extravagance of all classes. He says:

"What were luxuries yesterday are considered necessities today. Where this is to end it is difficult to foresee, and herein lies the hidden danger of the future."

There has never been a time since the Pharaohs when rich men did not surround themselves with all the comforts and luxuries which the art and civilization of the times could provide. This generation has more luxuries at its command, and takes all it can get. The difference with Pharaoh's day is that now poor people and middle-class people can get luxuries that Pharaoh never dreamed of. We do not see that ordinary people are, as a whole, particularly extravagant in their enjoyment. They go to the theater a good deal if they live in the city; but that is not new. They have telephones in their houses, which is as characteristic a kind of popular luxury as we know, and has come to be thought a necessity, like letter writing. But it is no peril to the users. The bulk of people which THE INDEPENDENT reaches —and they are representative of the controlling element—appear to us not to be recklessly extravagant. We see no reason why they should not enjoy all the comforts which science and art provide, and which they can afford. If financial disaster comes they will live on their savings and retrench.

Vilatte

Archbishop Vilatte—we seem to remember him. He has turned up again, this time in Paris, where he wants to supply the regular tactual succession to an independent Catholic Church of France, and he is quite willing to be of service in supplying the essential episcopal regulants. He was, if we remember, originally a Roman Catholic, and then coquetted awhile with Bishop Grafton, of Fond du Lac fame; but he wanted to be made himself a bishop, and Bishop Grafton did not help him in it. Then he applied without success to the old Catholic bishop at Utrecht, who did not see it his duty to give him the favor he wanted. Then he disappeared for a year or two, and then blossomed out as a full-fledged archbishop. He had been to Ceylon, where there is a Syrian Jacobite Church, and where, by the authority of the Syrian Patriarch, Archbishop Alvarez and the bishops of Niranam and Cottayam, he received the archbishop's miter. Then back he came, with no display of wealth or glory, to Philadelphia, where he soon burst on us with a chromatic dignity that ought to have appealed to Bishop Grafton. But it did not, and the bishop *deposed* the archbishop, or tried to, and the Anglican monk Ignatius defended the regularity of his orders, which were really beyond suspicion. A rumor that he had gone back to the Catholic Church must be questioned, for that would have involved resigning his ecclesiastical rank, and *vult archiepiscopari.*

A Moslem Preacher

Not all the fruits of missionary work in belated lands are to be found in the converts gathered and the churches established, nor yet in the better civilization developed. A good part of it is in the incidental influence on the religious bodies from which converts are sought. In India the various types of reformed Hinduism gather their inspiration from Christian ideals and attempt to keep the form of Hinduism, with the spirit of Christianity. So in Japan the reformed Buddhism tells the same story. It would get all the good possible out of Christianity without its distinctive theology. The same appears not only in the regeneration of the old Armenian Church in Turkey, but also in Mohammedanism itself, of which Babism is an example. The Rev. H. N. Barnum writes us from Harpût and tells of the excellent Vali who ordered that in the preaching in the mosques during the holy season of Ramazan the emphasis should be put on moral character. He told the preachers they must attend to duties pertaining to the present life, for, said he, "We know about the next life, but what is needed is to know how we ought to live here, what are our duties to society and the state, how we can become decent, respectable and useful citizens"; much such a talk as our President is in the habit of giving. Mr. Barnum went into a principal mosque to learn how the orders were obeyed. The Vali was present and the mosque was full. After the prayers the preacher climbed into the

pulpit by a ladder and took a seat. After an extempore prayer, mostly in Arabic, with a little Turkish interspersed, he read a few sentences from the Koran, and then for nearly three-quarters of an hour he delivered a most practical sermon. As he saw Mr. Barnum in the audience he said some things probably for his benefit. He said that Christians were to be treated with all kindness, that Moslems accept the "Injeel" (New Testament) as one of the four sacred books, that Christ was one of their prophets, etc. He spoke strongly against cheating in trade, against lying, against impurity, against appearing to others what we are not in reality, against an outward keeping of the fast and eating in secret, etc. He declared that God regards the motive in our acts, and that "if you wear out a hundred prayer rugs by praying upon them it is of no avail unless you are right yourself." It does no good to make a show of religion. "You can't deceive God." This sort of preaching varies little from the lines of the Sermon on the Mount.

We do not question that there is needed a modification of our naturalization laws as regards naturalized Americans who return to their native country. It is not decent that a German or a Turk, who perhaps wishes to escape serving in the army, should flee to this country, get naturalized here, and then go back to live, but under the American flag's protection. It is proposed that five years' residence in his native country be regarded as proof that he does not wish to be a resident American citizen, and that seems to be a fair conclusion. Of course these Germans and Turks may object, for American citizenship gives them certain advantages; but that is not the purpose of naturalization. If they want to be Americans let them live here.

In response to the directors, Mr. Conried consents to withdraw "Salome" from the stage of the Metropolitan Opera House. The public protest forbids its continuance. Two critics have expressed our disgust at the story, and our admiration of the music. It is a case in which moral decadence and perversity forbids the alliance of good art. The name of the author of the text, Oscar Wilde, should be enough to exclude from decent homes or ears anything he has written. It is impossible to disassociate the infamous career of this man, imprisoned for unnatural vices, from what he has written.

One cannot but pity Mrs. Sage, with many millions of wealth, and besieged with various requests for beneficence far beyond her ability to comprehend. But she has done well in her last gifts—a million to the Troy Polytechnic Institute, $250,000 for the International work of the Young Men's Christian Association, and $100,000 to the Emma Willard School, of Troy. We hope she may live long enough and have wise enough advisers to give the rest of her property as happily.

It does not follow because the official program of the Hague Peace Conference does not contain any item for discussion on the restriction of armaments, or on the Drago Doctrine, that they will not be introduced. The United States has reserved the right to present other questions, and doubtless other Powers may do the same. Further, it is to be remembered that the most important act of the first Peace Conference was to provide a court of arbitration, and that was not in the program.

Another Hipple, brother of Frank K. Hipple, who wrecked the Philadelphia Real Estate Company, has committed suicide as the result of that failure and his brother's suicide. He had borrowed heavily from the company and gone into real estate investments, and when the receiver took the property he was ruined and took his own life. And yet he was prominent in religious work and universally trusted.

Some maids of Wakefield, Mass., are reported to have sent a petition to the Legislature asking that bachelors be taxed from $5 to $20. That is quite insufficient. The better law would be one to require that all bachelors over thirty years of age should pay a tax to the State sufficient to support a woman of their rank in society.

Insurance

Insurance Settlements Incident to the San Francisco Fire

Hon. Julius Kahn, of California, whose article in The Independent on January 3 on the subject of "The Japanese Question in California" attracted wide attention, in a speech delivered in the House of Representatives on January 25th exhaustively considered the subject of insurance settlements incident to the San Francisco fire. His speech, which appears in the *Congressional Record,* is unfortunately too long for printing *in extenso* in this department. The Independent concurs with him in thinking, however, that the subject he discussed was an interesting one, and that every man in the United States, no matter what his vocation, no matter whether he happened to be a large or small insurer, was entitled to know whether the company that accepted his premiums was an honest or a dishonest company. According to the facts presented by Mr. Kahn, but few of the 118 insuring companies settled their losses without discount. He names the California, the Continental, the Liverpool and London and Globe, the Queen and the Royal as the only companies which settled all claims at one hundred cents on the dollar without discount. A very large number of companies, including most of the English companies, paid their losses at 1 and 2 per cent. off for cash paid before the expiration of the sixty days to which the companies were entitled under their policies. It is a noticeable fact in this connection that not a single German company paid its obligations in accordance with the conditions of its contracts. The situation at San Francisco was altogether without precedent, and certain of the interested companies absolutely repudiated liability under the so-called earthquake clauses, of which there were several types of substantially the same import. The most conservative estimate of the totality of the San Francisco losses due to the earthquake, according to Mr. Kahn, reached the sum of $350,000,000, upon which there was a total insurance of $235,000,000. Incorporated with Mr. Kahn's remarks made in the House is the illuminating report on the fire insurance situation following the San Francisco conflagration made by Prof. Albert W. Whitney, of the University of California. The showing made by the companies as a whole at San Francisco, as compared with that at Chicago, was very favorable, 80 per cent. of the claims having been paid at San Francisco, as against 50 per cent. at Chicago. The Baltimore record reached 90 per cent.

Destruction of Publishing Plant

The entire plant of the Phelps Publishing Company at Springfield, Mass., comprising four buildings and covering almost an acre of ground, was burned last week. The loss will approximate nearly $1,000,000, partly insured. The cause assigned for the fire was spontaneous combustion among some benzine-soaked rags in the basement of the main building. The firm published the following magazines, viz., *Good Housekeeping, American Agriculturist, Judd Farmer, New England Homestead, and Farm and Home.* Arrangements have been made to publish the periodicals named in New York and other cities until the Springfield plant can be rebuilt. The automatic sprinklers with which the buildings were equipped failed to extinguish the flames, and when the firemen came it was found impossible to save the plant, which was located in the very heart of Springfield. Fortunately there was no wind, and the fire took place before the opening of business, so that no lives were lost. Nearly 500 persons will be thrown out of employment.

Grover Cleveland has been unanimously elected to the position of chairman of Paul Morton's recently organized Association of Life Insurance Presidents. He will also act as its chief counsel, and will receive as compensation the sum of $25,000 annually. Mr. Cleveland will remain a trustee of the majority stock of the Equitable Life Assurance Society. The secretaryship of the Association of Life Insurance Presidents has been offered to James V. Berry, Insurance Commissioner of Michigan. If he concludes to accept it he will have charge of the publicity connected with the association.

Financial

The Great Northern Cases

In its attempt to issue $60,000,000 of new stock at par, the Great Northern Railroad Company has encountered much serious opposition. The Attorney-General of Minnesota interfered, some weeks ago, by asking the courts to compel the company to apply to the State Railroad and Warehouse Commission for permission to issue this stock, because the law of the State provides that a railroad must so apply and must show a necessity for the issue. It was claimed by the company that it was empowered by its charter to issue stock at will, and that the law granting supervisory authority to the Commission was unconstitutional. On January 23d Judge Hallam, of the State court in St. Paul, sustained the Attorney-General, overruled the contentions of the company, and issued an order enjoining the company from issuing the stock during the pending litigation without first applying to the Commission and obtaining its consent. Then the Attorney-General asked the court to compel the St. Paul, Minneapolis & Manitoba Railroad Company (the parent company of the Great Northern) to show cause why its charter should not be forfeited. All the stock of this company is owned by the Great Northern, and these proceedings strike at the merger by which the Great Northern system as it exists today was made. It is alleged by the Attorney-General that when the Great Northern took over or bought the Manitoba (the two companies having the same stockholders) "a very large amount of watered stock was issued by the Great Northern." He claims that this stock is void.

His allegations should be thoroly investigated, and the proposed issue of new stock at par should be subject to the decision of some authority representing the people. It is a question, however, whether this authority, or official body, should be one representing the people of Minnesota, or one representing the people of the United States. The railway system for which it is proposed that this new stock shall be issued, ceased long ago to be confined to the State of Minnesota. Its most important functions today are of an interstate or national character. Probably the time will come when questions like some of those raised in these proceedings will be settled by national authority rather than by the authority of a single State, in the territory of which is situated only a small part of the property and system of the railway company involved.

....The First National Bank of Morristown, N. J., of which Albert H. Vernam is president, is about to increase its capital from $100,000 to $200,000, and its surplus from $100,000 to $300,000.

....The corporation of Lord & Taylor has notified its common stockholders that the dividend is to be placed on an 8 per cent. basis, against 7 per cent. heretofore. The quarterly dividend, due May 1, will be 2 per cent.

....The new statement of the American Real Estate Company shows a capital of $100,000, a surplus of $1,419,518, and total assets amounting to $9,446,095. The six per cent. bonds of this company are based on the ownership of selected New York realty.

....To J. P. Morgan & Co. and Kuhn, Loeb & Co., of New York, and Kidder, Peabody & Co., of Boston, has been entrusted the sale of the American Telephone and Telegraph Company's new issue of $40,000,000 of convertible four per cent. gold bonds, the subscription price being 92½ and accrued interest. These great banking houses are accustomed to dispose of such large issues in a very short time.

....The Mechanics and Traders' Bank has recently elected a new president, Davis A. Sullivan, the president of the Union Bank of Brooklyn. Mr. Sullivan was born in New York forty-one years ago and began his career in the law offices of Carter, Hughes & Cravath and Barlow & Witmore, but five years ago left the law to become president of the Stuyvesant Bank of Brooklyn. A. M. Dederer, who has for twenty-five years been connected with the Mechanics and Traders' Bank, continues as cashier. The vice-presidents are Edward R. Thomas, Leo Schlesinger, Isaac Stiebel and Louis H. Holloway. The Mechanics and Traders' Bank was organized in 1830. Its capital and surplus amount to $1,086,937 and its deposits are $8,615,960.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Relations with Japan

Mayor Schmitz and the members of the San Francisco Board of Education were in conference with the President at the White House on the 9th. In the course of his journey eastward, the Mayor had said to reporters that no Californian would stand upon technicalities if convinced that the welfare of the whole country was in danger. He was inclined to make concessions with respect to the treatment of the Japanese school children if thereby the exclusion of Japanese laborers could be obtained. No report of what took place at the conference was given to the public, but on the morning of the 11th it was asserted, apparently upon good authority, that at a second conference the visitors would be assured by the President that he would use his influence to procure a treaty providing for the exclusion of Japanese coolie labor if they would put an end to discrimination against the Japanese children in San Francisco. Owing to the publication in that city of reports that the Mayor had "surrendered," he received many messages from persons there, urging him to insist upon exclusion. The Japanese and Korean Exclusion League demanded that exclusion should be required by act of Congress, and not by treaty. Part of this message was as follows:

"League demands exclusion by act of Congress. Treaty will not exclude. Sovereign rights must not be bartered away by promises and should not be basis for compromise. We will not yield one iota of our rights as a sovereign people, regardless of cost or consequences. If President wants to humiliate American flag, let him tell California's Governor to repeal the law, but he cannot coerce free Californians to bow in submission to the will of the Mikado. Roosevelt's power will not make one white man out of all the Japanese in the Nipponese Empire."

From the Los Angeles Chamber of Commerce, on the other hand, Mr. Roosevelt has received a resolution saying that the general trend of opinion in Southern California is decidedly averse to any discrimination against Japanese in the schools.——Richard Olney, formerly Secretary of State, has written a long letter in which he argues that the treaty affords no ground for Japan's claim, and that our Federal Government has no right to interfere with a State's school provisions.——In the Senate, on the 8th, Mr. Frazier, of Tennessee, declared that if the Federal Government by treaty "could rob a State of its right to control its school system, the last stronghold of local self-government" was gone. If San Francisco, he added, could thus be forced to take Mongolians into her schools, Tennessee in the same way could be compelled to receive in her schools the negroes of Cuba or Santo Domingo.——In Japan, all talk of war with the United States is called ridiculous and absurd. Foreign Minister Hayashi, in an interview, says there is "not the slightest germ of a war spirit in Japan," whose people appreciate President Roosevelt's intentions and rely upon the American sense of fairness. It appears that the war talk of some of our newspapers and politicians has caused "surprise and regret" in Japan, where leaders of opinion say that this country is "the last one in the world" with which Japan could be induced to fight. At the same time, however, the Japanese press finds it difficult to account for "the barbarous attitude toward innocent children in a Christian

land." The absence of warlike feeling has been explained by Baron Kaneko as follows:

"The Japanese understand America better than the Americans understand Japan. A great majority of the men holding public positions here were educated by American instructors and have long studied American institutions. Now, thru the press and otherwise, they are helping the people to appreciate the difficulty the Federal Government lies under in controlling the action of the individual States. . . . . Bushido, Japan's moral system, insists that a finger shall never be raised against a benefactor. Japan owes her position among the powers to America. The American Government and people, with England, are Japan's best friends. War is unthinkable."

Washington Topics

Several bills relating to child labor, and resembling the bill which Mr. Beveridge has been supporting in the Senate, have recently been introduced in the House. By resolution, the Committee on the Judiciary was asked for an opinion as to the jurisdiction of Congress over the subject. In a report adopted by unanimous vote, the committee says that "Congress has no jurisdiction or authority over women or children employed in the States in the manufacture of products for interstate commerce shipment." Mr. Beveridge says this is an absurd opinion and speaks of the committee as "a sort of junior Supreme Court behind which members may hide to avoid voting for reforms."——The Service Pension bill, the provisions of which we recently published, was passed in the House last week by a vote of 196 to 20, and is now a law.——In preparing the annual bill for the postal service, the House committee has reduced by about $10,000,000 the sum paid for carrying the mails on the railways.——Senator Heyburn, in a speech criticising the administration of the public lands laws, asserted in the Senate, on the 4th inst., that "the largest land grabber is one of the vice-presidents of the National Forest Reserve Association of the United States." The name was not given. "He owns more land, the title to which was illegally obtained," continued the Senator, "than any other man or all other men in the United States, and he is vice-president of an association whose president is our worthy Secretary of Agriculture."——Dispatches from San Francisco say that within the last few weeks inspectors of the Interior Department have discovered very extensive land frauds "involving men of wealth, influence and high social standing in California."

Mr. Rockefeller's Great Gift

John D. Rockefeller has given to the General Education Board $32,000,000 in securities, which the Board will receive on or before April 1st. This great gift is in addition to $1,000,000 in 1902, and $10,000,000 in 1905, from the same source. At a meeting of the Board in New York, on the 7th inst., John D. Rockefeller, Jr., handed to the secretary the following letter, signed by himself:

"GENTLEMEN—My father authorizes me to say that on or before April 1st, 1907, he will give to the General Education Board income-bearing securities, the present market value of which is about thirty-two million dollars ($32,000,000), one-third to be added to the permanent endowment of the Board, two-thirds to be applied to such specific objects within the corporate purposes of the Board as either he or I may, from time to time, direct; any remainder not so designated at the death of the survivor to be added also to the permanent endowment of the Board."

Before adjournment, the Board prepared and forwarded to the elder Mr. Rockefeller a letter expressing its gratitude and its deep sense of the responsibility imposed. Parts of this letter were as follows:

"This is the largest sum ever given by a man in the history of the race for any social or philanthropic purpose. The Board congratulates you upon the high and wise impulse which has moved you to this deed, and desires to thank you, in behalf of all educational interests whose development it will advance, in behalf of our country, whose civilization for all time it should be made to strengthen and elevate, and in behalf of mankind everywhere in whose interests it has been given, and for whose use it is dedicated.

"We will use our best wisdom to transmute your gift into intellect and moral power, accounting it a supreme privilege to dedicate whatever strength we have to its just use in the service of men."

Members present who signed this letter were Frederick T. Gates, chairman; George Foster Peabody, treasurer; Dr. Wallace Buttrick, secretary; Robert C. Ogden, John D. Rockefeller, Jr., Albert Shaw, Starr J. Murphy, Edward A. Alderman and Harry Pratt Judson. The names of the following absent members were affixed by their associates: E. Benjamin Andrews, Hollis B. Frissell, Daniel C. Gilman, Hugh H. Hanna, Mor-

ris K. Jesup, Walter H. Page. With respect to the first gift of $1,000,000 it was specified that the money should be used for the promotion of education in the South. The second gift, $10,000,000, was to be employed "to promote a comprehensive system of higher education in the United States." From the income of it eighteen colleges, nearly all of them in the South or Middle West, have received gifts amounting of $1,077,500, conditioned upon their success in obtaining three times as much (or $3,232,500) from other sources. In co-operation with the Department of Agriculture, the Board has used a part of its income for the instruction of farmers in several of the Southern States. It is thought that this work will be extended. The Board's aim will also be to assist "the great centers of population and wealth which have been neglected in our system of higher education." Chairman Gates points out that there are forty cities, each having a population of more than 100,000, in which there are no local opportunities for a college education, and that there are about 400 colleges situated in small country towns. "The most immediate and imperative educational need unfilled today in the New England and Middle States," he says, "is that of women's colleges." Men's colleges are crowded, he adds, and the women's colleges are overcrowded. In his judgment, "there is absolutely no economical advantage in uniting them." The Board will apply a remedy for this overcrowding by establishing new colleges for women or by enlarging those which now exist.

The Panama Canal Work

William J. Oliver, the lowest bidder for the canal work, has succeeded in organizing a powerful company of contractors, but the Government's decision is not yet announced. He was required to associate with himself (in the place of Mr. Bangs) two contractors of good repute and sufficient financial resources. With the help of Mr. Stevens (New York's Superintendent of Public Works) he has induced a dozen to join him, together with two or three business men of large interests. The most prominent of the contractors is John B. McDonald, who built the New York subway and is an officer of the Ryan-Belmont corporations which own the street railways of that city. Mr. McDonald is president of the company formed to support the Oliver bid (the Panama Construction Company, capitalized at $5,000,000) and Mr. Oliver is vice-president. Among the contractors who are directors of the company are several who are widely known for what they have done in certain departments of heavy work, such as masonry, excavation, dredging and concrete construction. Superintendent Stevens is represented by officers of his bank in Washington. The chairman of the board is R. A. C. Smith, a capitalist largely interested in steamship companies doing business with the West Indies, and in business enterprises in the countries and islands in the neighborhood of the Isthmus. Some thought that the new company had the support of Thomas F. Ryan and August Belmont, but these capitalists say they are not connected with it. On the 7th, after Oliver had amended his bid and had reported to the Government the formation of his company, with due provision for the capital and bonds required, it was announced in the press, apparently upon good authority, that the Government was in danger of losing Chief Engineer Stevens. He would resign, it was asserted, if a contract should be awarded to any one. He had sent word to that effect, and the War Department was trying to induce him to remain. It was recalled that a year ago he advocated the contract plan, before a Congressional committee. One explanation offered was that he would have welcomed a number of separate contracts, each for a section, but that he felt that he would lose all credit for the work, and would drop out of sight, if the entire project should be covered by one contract. It began to be reported that the Government might reject all bids and do the work without resorting to contractors. According to dispatches from the Isthmus, however, Engineer Stevens now denies that he has sent such word to Washington and says he is still in favor of the contract method. It is said that the Government's decision as to the Oliver bid must be preceded by inquiries that will consume several days.

Chicago's Street Railways

By a vote of 56 to 13, on the 5th, the Chicago Council adopted an ordinance which, if approved by the people at the April election, will end the long controversy concerning the street railroads of the city. This ordinance provides that franchises for a term of twenty years shall be granted to the railway companies upon certain conditions, one of which is that at any time the city, after six months' notice, may buy the entire railway system for $50,000,000, plus the cost of improvements soon to be made. It is estimated that under the requirements of the ordinance the companies will expend $40,000,000 upon improvements in the next three years. This work of rehabilitation is to be carried on under the supervision of a board of three engineers—one to be chosen by the companies, one to be appointed by the city, and the third to be Bion J. Arnold, an engineer who has represented the city in its negotiations with the companies. There must be universal transfers, extensions required by the city must be constructed, and the city will receive annually 55 per cent. of the net profits. The companies will contribute $5,000,000 toward the cost of a new central subway, which the city will build and own. It is said that the ordinance will be vetoed by Mayor Dunne.——Charges relating to corruption in the Pittsburg Council with respect to a franchise for the Pittsburg & Tube City Railroad are still before the courts. Councilman William A. Martin was recently convicted of soliciting from C. S. Cameron, president of the company, a bribe of $70,000 for himself and others, and it is alleged in charges now under consideration that Cameron and Martin conspired with others to obtain by bribery the privileges that were desired.

Santo Domingo's Debts

A new treaty with Santo Domingo was signed on the 4th, and the ratification of it at Washington is expected. It is said to be a simple agreement providing for the collection of revenue by American officers and the deposit of 55 per cent. of the receipts in a New York bank. That is to say, it merely gives force by treaty to the temporary agreement under which the republic's revenues have been collected by such officers, and $2,300,000 has already been set aside to be used in payment of the republic's debts. Some think that the needed Democratic votes can be obtained now for this treaty, which differs so much from the one which has been pending in the Senate for a long time; but ratification may be deferred until after March 4th, when the Republicans will have a two-thirds majority. Ratification will be followed by an issue of $20,000,000 of twenty-year bonds by New York bankers, and the proceeds of this issue will be used in paying the republic's foreign debt, which, with the consent of substantially all of the creditors, has been scaled down from $30,000,000 to $17,000,000.

Cuba's Government

The order increasing the Rural Guard to 10,000 men and the artillery to 2,000 was followed, on the 5th, by a decree providing for a permanent army and a militia force. It appears to have been intended that the enlarged Rural Guard and the artillery should be regarded as the permanent army. All able-bodied male citizens between the ages of twenty-one and forty-five were made eligible for enrollment. The militia were to be called into service only in an emergency. These plans for creating an adequate force upon which the Government hereafter to be set up could rely for the preservation of order and the suppression of insurrection have not been well received. Protests were promptly sent to Governor Magoon by the Liberal leaders. Then, at a Liberal meeting on the 7th, bitter speeches were made. General Loynaz del Castillo denounced the United States and expressed contempt for Americans. Cuba, he predicted, would eventually be forced to resist American domination. He hoped to have the honor then of commanding her forces. General Garcia Velez declared that the United States had no right to say what Cuba's armed forces should be. Some said the whole thing was a Yankee trick to facilitate invasion. This meeting sent a protest to Governor Magoon. Representatives of other parties said to him that it was inexpedient to carry out

such plans. On the 8th, the Governor was authorized by Secretary Taft to suspend execution of the orders and to hear argument concerning them. It appears that objection is made by the Liberals because they fear that the added forces would be commanded by Moderates; by the masses, because they wrongly think the army plan involves conscription and compulsory service; by the business interests, because the creation of an adequate Cuban military force would facilitate the withdrawal of the American troops. Complaint is made, also, about the added cost, which would be $7,000,000 a year. A prominent newspaper of Havana asserts that the continued agitation for a protectorate is due to the desires and influence of the American Sugar Trust. Some observers say that the political situation is so unsatisfactory that the proposed elections will not be held this year.

Unrest in Central America

Reports from Central America say that war between Nicaragua and Honduras appears to be at hand, owing to a dispute over the invasion of Nicaragua by soldiers of Honduras in pursuit of political refugees. On the 8th, President Diaz, of Mexico, at the suggestion of President Roosevelt, asked Guatemala, Salvador and Costa Rica to make every effort to prevent such a war. He reminded them of their arbitration agreement of June last signed on board of one of our warships. On the 9th, the arbitration tribunal which had been considering the dispute between Nicaragua and Honduras gave up the task. It is said that Salvador and Guatemala also are on the point of fighting, because of quarrels relating to the war of last year. Dr. Rodriguez, Salvador's Minister to Guatemala, was severely beaten, not long ago, at a public banquet in the Guatemalan capital by two brothers named Foncea, prominent supporters of President Cabrera. It is recalled that Cabrera rejoiced publicly at his capital over the dead body of Regalado, the leader of Salvador's forces in the late war, until he was rebuked by President Diaz, who insisted that the body should be sent to Salvador. On the day of mourning in Salvador, after the arrival of the body, Dr. Rodriguez was the chosen orator. He denounced Cabrera for barbarity. His appointment as Minister to Guatemala did not promote harmony.

The Fight Against the House of Lords

The reopening of the Houses of Parliament on February 12th is an occasion of unusual interest because it marks the beginning of a determined attack upon the vested privileges of the Lords. Premier Campbell-Bannerman, in his summons to attend the session, employs the unusual phrase "to discuss matters of great importance," and several members of the Government have in recent speeches openly declared the purpose of the Liberal party to reform the upper House. Winston Churchill, Parliamentary Secretary of the Colonial Office, in an address at Manchester, said that "society was vitiated by many features of wasteful folly and unfairness, none of which was more obvious than the twin evils connected with the House of Lords and the land." It appears, he said, that it had deliberately evoked a constitutional struggle, and it was necessary to show without delay that the House of Commons and not the House of Lords was master in England. The Attorney-General, Sir John L. Walton, in a speech at Leeds, declared that the House of Lords was entirely

> "out of harmony with modern democratic institutions and must go. The Government would endeavor to give effect to the will of the people by bills, which the peers would probably throw out, leading to a combination of the Crown and the people to defeat the aristocracy."

He said the Liberals were entering upon "a grim and serious work, which would mean a revolution in the Government." If the House of Lords set itself against the national will, it would be like a heap of sand against rising water. It is expected that the policy of the Government will be to pass thru the House of Commons a number of popular measures, including a radical Land Bill affecting the estates of the peers. These being rejected by the Lords will, together with the Educational Bill, which they have already refused to pass, form the foundation of the issue on which the Liberal Government will appeal to the people. The battle will first be fought out in Par

liament. There will be one or two dissolutions which will delay the final issue until after April, 1908. Probably the first gun fired in the war on the House of Lords will be the passage of a resolution by the House of Commons declaring its supremacy in the Government. Then an attempt will be made to limit the power of the House of Lords to a veto power extending over one year. In that case a bill passed twice by the House of Commons with an interval of twelve months would become a law in spite of the action of the Lords. Lord Newton has prepared a bill for the reform of the House of Lords by its own members, by making it partially elective. A bill will be introduced early in the session for the purpose of satisfying the Irish demands for a larger share of local self-government. It is likely also that a non-Protestant university will be established by the Government in Ireland. The King has insisted upon strict secrecy as to the contents of the speech from the throne at the reassembling of Parliament, refusing to give out forecasts according to custom. What position he will take in the controversy is uncertain. Sir John Walton declared that the Crown and the people would unite to defeat the aristocracy. The opening Parliament will be unusually spectacular, owing to the revival of many ancient ceremonies, including a gorgeous street pageant.

Income Tax in France

Next to the separation of Church and State the most important measure in the radical program being carried thru by the French Government is the income tax, the bill for which was introduced into the Chamber of Deputies February 7th. It will replace all the older forms of direct taxation, such as the door, window and poll taxes. The tax is progressively increased on all incomes above $1,000 a year, ranging from 1-5th of 1 per cent. to 4 per cent. of the total annual income. The higher limit varies according to the source of the income. An income derived from personal and real property will pay 4 per cent.; one derived from an industrial and commercial property will pay 3½ per cent., and one derived from employment 3 per cent. Foreign stocks are admitted to the French market on payment of a stamp tax of 2 per cent. on their nominal value and 5 per cent. on the income they yield. French *rentes,* in which most of the people have invested their savings, are exempt from the stamp tax, but the income derived from them will be taxed according to the progressive scale given above. No distinction is made between foreign government and corporation stocks. The assessment of real estate and personal property will be made by the communes. The income from commerce will be fixed by the treasury agents. The incomes from salaries and wages will be obtained from the declarations of employers. Finance Minister Caillaux estimates that among the 10,000,000 taxpayers of France, there are 500,000 who will be liable to the progressive tax, because they have incomes of over $1,000 a year, and that the tax will bring in $24,000,000 to the Government. The object of the income tax system is to lighten the charges on land, to diminish the taxes on salaries and to increase the demands on acquired wealth. If the income tax bill is passed, as it undoubtedly will be in some form, Portugal, Belgium, Hungary, Russia and the United States will be the only countries left which have not adopted an income tax. The introduction of the bill produced at once a fall in the price of *rentes* and other securities in the Bourse. In the discussion in the Chamber the opponents of the income tax measure declared that such socialistic measures would injure the country by laying a burden upon industry and economy and driving French capital to seek foreign investments, where it has freer scope for business operations. In reply to this, M. Jaurès and other Socialist Deputies declared that the decline in the stock market was due to accommodations of financiers in order to defeat the proposed legislation. The Socialist leaders made a fiery attack upon the French banking houses for artificially maintaining the prices of Russian securities during the Japanese war, and accused the Government of encouraging the supplying of French money to the Russian Government in order to enable "the assassin Czar to crush his struggling people."

The speakers were called to order for the use of such unparliamentary language, and M. Pinchon, Minister of Foreign Affairs, declared that:

"Nothing has occurred to warrant loss of confidence in Russian finances or Russian friendship. France and Russia are mutually supporting each other every day, thus contributing to the peace of the world. The attachment of France to her ally is stronger than ever."

M. Caillaux expressed his regret that French money was going abroad, but was pleased to see it strengthening the friends of France.

Other Questions of French Politics

The French Senate has rejected the proposition voted by the Chamber of Deputies at the last session to purchase the Western Railway System. M. Prevet, chairman of the Senate committee to which the question was referred, expresses the opinion that the Government neither expected nor desired the bill to pass the Senate. It was put thru the Chamber hurriedly just before the elections as a sop to the Socialists, and none of the very complicated questions involved were considered or discussed. The purchase of the railroad by the State would involve a complicated and expensive litigation before the Council d'Etat lasting several years. It is said that the directors of the Western Railway Company, believing that the road was soon to be taken over by the State and that they would be compensated according to its value as shown by its profits during the last two years, have allowed the property to deteriorate in order to get as great an income from it as possible. The comfort and convenience of passengers is said to have been neglected, and there have been recently many fatal accidents on this line.——The bill for granting divorces by mutual consent is under consideration by the Committee on Judicial Reform in the Chamber of Deputies. Legal procedure is simplified so much that no lawyers are needed. After three years of marriage a couple may apply before a magistrate and declare their desire to separate. If the couple repeat this declaration twice more the magistrate will grant their divorce at the end of the two years from their first application Questions of alimony and the custody of the children must be agreed upon by the couple before their first appearance. The assent of their parents is not necessary.——The Vatican has announced that Minister Briand's latest plan for the lease of the churches is unacceptable in its present form. The points objected to are that the mayors are allowed freedom of action in regard to the renewal of the lease of churches on a change of parish priests. This would make their tenure of the churches dependent upon the arbitrary decision of the municipal councils and upon party strife in small centers. The cultual associations still do not meet the requirements of the Vatican, because they do not sufficiently recognize the power of the hierarchy. The Government has indicated its willingness to make the desired modifications.

The New Reichstag

In the elections to the Reichstag the Kaiser has not attempted to preserve even the pretense of neutrality. Before the elections he openly appealed to the people as a patriotic duty to overthrow the Socialists, and since the result of the balloting is known he has been busy in extending his congratulations over their defeat. The attention of the empire was especially directed toward the first electoral district of Berlin, in which is situated the Emperor's palace. All the other districts of Berlin had elected Socialist representatives in 1903, and the report was circulated that if this district was carried by the Socialists the Emperor would move to the Potsdam palace, which naturally would injure the commercial interests of the district. The first election not resulting in a majority vote for any candidate in this district, a second ballot was necessary, and in this Dr. Kaempf, the Progressive candidate, defeated Herr Arons, Social Democrat, by a vote of 8,071 to 4,502. In the evening a crowd of several thousand assembled in front of the royal palace to cheer the Emperor, who appeared at a window on the first story over the grand entrance in full uniform and accompanied by the Empress, the Crown Prince and his other sons, and addressed the people in the following language:

"I thank you from my heart for your ova

tion. The result of the election shows the truth of the Chancellor's words that Germany can ride in the saddle, and if my people remain united, both of high and low degree and all confessions of faith, she will not only ride but know how to ride down everybody and everything which stands in her way. I hope that this demonstration is not a mere temporary outburst of patriotism, but that it represents the fixed determination of my people to stand together for all which contributes to the glory and greatness of our fatherland. Germany has learned the art of victory, and I have no doubt she will continue to use the art she has learned."

Vorwaerts, the Socialist organ, comments as follows on the Kaiser's speech:

"We have nothing against the fact that thru this new midnight declaration the childish illusion of the kingly office standing above parties is radically dispelled. In a certain sense we can be perfectly satisfied with the latest Imperial speech. It shows how irrevocably the Crown has been drawn into the political combat of the day, that it has raised its banner in the fight of the classes, and, of course, on the ramparts of the ruling, possessing class. Socialism, nevertheless, contemplates with equanimity the attacks which have been announced. Equipped with the arms provided by modern development it awaits the onslaught with courage and confidence."

The returns, which are nearly complete, indicate that the Reichstag, which meets on February 19th, will be constituted as follows:

Conservatives, 81 (against 74 in 1903); Centrum, 108 (against 104); National Liberals, 56 (against 51); Progressives, 48 (against 36); Social Democrats, 43 (against 79); Poles, 20 (against 16); Anti-Semites, 26 (against 21); other parties, 12.

Altho the representation of the Socialists is reduced owing to the method of districting the empire, they have increased their total vote from 3,010,000 in 1903 to 3,251,000 this year. The Clerical vote is 2,274,000, an increase of 398,000. The Center, or Clerical, party, whose opposition to the colonial program forced the dissolution of the Reichstag, is, with its allies, the Anti-Semites and Poles, stronger than before.

German University Data

The reports of attendance at the twenty-one German universities for the present winter semester show some notable features. The sum total of enrollment is not only greater absolutely, there being 45,136 on the list, but the relative increase has also been greater than ever before, showing that the specter of a "learned proletariat" has not yet disappeared. Again, the attendance of foreigners is greater than ever before, being 9.2 cent per cent., as compared with 8.4 per cent. a year ago. The total of foreigners is 4,151, of whom Russia alone furnishes 1,890, or nearly three times the Austro-Hungarian quota, which is next on the list. Every civilized and uncivilized state in the world is represented in this contingent, there being 3,717 from other European states, 302 from America, 113 from Asia, 13 from Africa, and 6 from Australia. Berlin alone has 1,189 non-German students, or 14.5 per cent. of the total enrollment. Medicine is the leading department of these strangers, with a contingent of 1,090 outsiders, but closely followed by philosophy, language and history with 951. The woman contingent is also greatest in the history of the Berlin institution, being 783, a phenomenal growth from the 96 of ten years ago. Of these, however, 601 are German. The leading favorite is the modern language department, with 271 women, while medicine, which formerly headed the list, has only 94 to report, even less than art and history with 97. The bulk of these women—namely, 576—declare that their purpose is only general improvement in education, while only 36 propose to take the doctor's degree and 83 expect to be teachers in high schools for girls. Only 128 came fully equipped with a *testimonium maturitatis* from a nine years' secondary school. A vigorous effort is being made, and it is claimed with prospects of success, to have Prussia open its excellent universities to women, too, as this has been done by the South German institutions. A new work by Frederick v. d. Leyen, on "Deutsche Universitat und deutsche Zukunft," is the sensation of the hour in German university circles, because the author vigorously declares that these famous schools train only specialists, but not men. He wants less professionalism and more culture. No less a man than the great Jena pedagog, Professor Reiss, has given the work careful discussion in the *Allegemeine Zeitung*, of Munich. No. 7 of the Beilage.

Play and Dancing for Adolescents

BY G. STANLEY HALL, LL.D.

AUTHOR OF "ADOLESCENCE," AND PRESIDENT OF CLARK UNIVERSITY.

PLAY has within recent years become one of the most prominent subjects, not only in education, but in psychology, and has already voluminous literature of all grades of merit. Hundreds of plays and games have been described and various efforts have been made to classify them into some kind of a system, but so far in vain. There are plays for the street, the house, the home, the school, individual and collective games, plays with and without apparatus or utensils, plays for girls and boys, for different ages. Many are of great antiquity, and some can be traced with certainty back to ancient Greece and Rome and even to early India and prehistoric time. One able and ingenious writer has sifted and attempted to curriculize some 400 of them, so as to educate every part of the body and every quality of the mind of the young. Russia has held at least three toy congresses in recent years. There may almost be said to be a code, as well as a science, that focuses on dolls alone, and the subject seems to grade over among primitive races into the idols. Germany leads the world in toy making, and it is marvelous to see how intricate yet how cheap some of these are. They may be masterpieces of simplification by which to reduce mechanical, physical and sometimes even chemical principles to their simplest terms. In some of the toy museums of Europe we find, for a few pence each, insects and birds that actually fly when wound up; steam engines and boats that not only go forward, but backward; pyroscopes, balloons, while the kite, and especially the top, take us well on toward the secrets of the material universe. We are beginning to realize the importance of at least free play, because the free playground movement has already well advanced among us and has its experts, and makes a very material contribution to the health and morals of congested city districts. We are also appreciating the importance of playtime, and are in some places lengthening recesses, providing free afternoons and special holidays and giving play laws, and cities are erecting free gymnasia, roof gardens and furnishing gymnastic apparatus, etc.

To one who raises the question what play really is and means there are really today three answers, so that we can have our choice of theory. One is that most closely connected with Herbert Spencer, which teaches that play is superfluous activity, or the overflow of vitality after the kinetic energy of the body has performed all needed functions of respiration, circulation, digestion, etc. If there is abundant vitality, the child or animal plays. If vitality is deficient, he ought not to play, and therefore ought not to be educated, for play power is the very power that is drawn upon in education. The second view, however, is that of Gross, that play is practicing in childhood activities that will be necessary in mature years. The kitten playing is, altho unbeknown to itself, practicing the art of rat-catching. Children imitate vocations of adults. There is doubtless something true in this view. In caring for the doll the girl is practicing to take care of babies. The toy-house builder, the coachman, making the doll's bed and keeping the house thus look forward. But the third view is that play is rehearsing activities of the race in the past. The child loves to play hunting with the spear, bow and arrow and toy gun because its ancestors in remote ages and for many generations were hunters. It loves pets, because its ancestors passed thru a long pastoral stage and domesticated animals, practices gardening because it inherits an instinct for the soil. Some games are relics of extinct religious rites, like counting-out games. On this view play is the best kind of education, because it practices powers of mind and body which, in our highly specialized civilization, would never other-

wise have a chance to develop. Hence, in my opinion, this latter view contains more truth than any other, and to understand the play instinct we must know something of the past life of the race, and even where we do not understand it we must assume that we could do so if we knew more of the past.

When the child reaches adolescence very distinctly new features enter into its plays and games. One of the most notable of these among boys is that games can now be organized, whereas they could not before. Boys of ten or even eleven who attempt to organize ball and other teams constantly find their members falling apart or dropping out; a bold individual will defy the rules of the game and perhaps hold it up in a critical moment, sulk and go home. The individual has not learned to work with the others, but the boy in the middle teens respects the rules, has a sense of team honor, loyalty and pride, submits to the umpire, does not play for his own edification, but for the good of the group. His organization may remain intact for a season or even for successive seasons. This is because the social instinct, inherited, no doubt, from old tribal days and customs, now begins to make itself felt. He is self-sufficient for his nine, and is proud if he wins honor for it and not merely for himself. This is the age of the gang, which very often is at first predatory and occasionally criminal. Boys in the early teens seem often absolutely reckless and fearless in the presence of their mates, defying policemen and perhaps committing crimes of violence, but are arrant cowards if they are alone. Not only solitary, but unorganized plays and games, lose their charm, and the adolescent boy must play with others in order fully to enjoy it. This principle is at last coming to be well recognized by those who work with children. The boy is in the age of the tribe, sept or corm. He takes his spirit, whether for good or bad, from his associates, who have far more influence upon his real character than adults. Tactful grown-ups, however, often accomplish remarkable results by joining these organizations, not as leaders but as humble members, making their influence felt only at critical points. This is the golden age, therefore, for teaching co-operation and training the callow youth for membership in a social community. Hence, the plays of this age ought to be such as to bring out the best powers of the mind and the body. Have clear rules, the necessity of which all recognize, for they can thus be made very effective for schools of implanting the ideas of justice, of self-subordination and mutually helpful. The gregariousness of this age is thus one of its secrets, and a leverage not only of charm, but of potency, for those who know how to use it aright.

Another element of adolescent play is contest. Small boys often fight, but their conflicts are on an entirely different plane. One chief desire of adolescent youth is to know how he ranks with others. Much of his secret thought centers about the question whether he is to be a leader or a pariah, a great man or an underling. Hence he enters with great zest into plays where his strength, skill, ingenuity, endurance, invention, general ability are brought against those of another, in order that he may know where he stands and find his rank on many a scale of excellence. It is not so much that he hates or would cause others pain as that he would assert, if possible, his superiority, so that the spirit of rivalry comes in and is a very legitimate and helpful motive. Of course, it can run into malicious jealousy and can tempt him to win by trick or unfair subterfuge, but even these instincts perhaps have a justifiable nascent period, so that the danger lies in prolonging or intensifying them, so that they should not be eradicated, but only subordinated.

One of the greatest dangers of the play of modern American youth is that, instead of being a school of honor, as it should be, it will sink to become a school of dishonor. If, in intercollegiate sports, especially on the gridiron, a true spirit of sportsmanship prevailed, our young barbarians at play would prefer to be beaten than to succeed by unfair means. There would be no secret practice. I often recall the fact of the English tennis champion playing an international rubber game, who, when his American antagonist made a fluke, which would have lost him the game, deliberately made the same fluke himself, because he wished the really

best man to win. The deplorable thing about college football today in this country is that in this sense it is a school of dishonor rather than of honor, and that this sentiment should be rife among college youth, who, the old proverb declares, are the best material for prophecy, is a sad comment upon the spirit of American life and an unhappy omen for the future.

For one of the most beneficent groups of play activities for adolescents I know no better name than dancing, despite the fact that this term has so many undesirable associations. I do not mean the few wretched relics of dancing found in the modern ballroom, least of all the waltz and the two-step, which are by no means representative of dancing in its large ethical and psychological sense.

We must bear in mind that rhythmic movements no doubt preceded music, the first forms of which were only incidental to it. National music now is often based upon national dances and there is now very much music that cannot be perfectly understood because the dances which it expressed have become obsolete. The only way of fully understanding such music is to revive the dance from which it sprung, or if this is impossible to create one from it. This is already well understood and has in some places been put into successful practice. Dance is the mother, not only of music, but of poetry. The Greek drama itself sprouted from the far older chorus, which consisted of marching in strophe and antistrophe and often with pantomimic expressions of the sentiment expressed by the words. Dancing is the oldest form of ritual worship and is found among every savage race, and some dances are like passion plays, so sacred that an error may be punished by death. As Neale has shown in the early Christian Church, the term was so comprehensive as to include the magnificent processionals and recessionals and the pantomimic modes of acting at the great events in the lives of saints and even of Jesus and his associates. The original expression of all psychic content is motion: by it hunger, love, anger, fear, desire, communication were all expressed to the eye. Speech came later and for a long period it was florid with inflections, intonations, cadence, speech music as well as gesture. Now, however, most of all the motor element of expression is minimized and desiccated to movements largely labial and dental. Hence, speech has become a superficial form of expression of the soul. Our attenuated utterances play over its surface and lying is easy because communication is so far removed from action. The purpose of dancing is to restore motor elements of expression, to make utterance more hearty, so that man shall talk with his whole organism and thus establish a larger and deeper unity of soul and body. No doubt this makes for honesty. Incidentally this reinforcement of communication makes also for body culture and health by developing muscles and motor combinations prone to atrophe from disuse and so makes for control of strength and grace. This kind of culture is most educative of all because it places the control of the muscles under the will, and the exercises involved are always of kinds which the human race through its long pedigree has been most habituated to. Thus ancient bodily habits are restored, dwindling rudiments developed, and compared with most forms of modern industry which lay stress only on special activities, dancing in this sense is the most generic liberal culture of soul and body making for joy and freedom. This explains the wondrous charm of dancing. It is because these movements when free and unconstrained, yet really expressive, are those to which our forebears for uncounted generations found the chief expression of their vital energies and of their souls.

I would have dancing taught in every school, even if the school had to be opened evenings for that purpose. The dances chosen should be simple, rhythmic, allowing great freedom, such as the Morris dances now being revived in England and sometimes the song and dance. We should also teach old folk and national dances after very careful selection from a wide repertory. The object aimed at should be the cultivation primarily of the sense of rhythm; next, the ease and economy of movement, for grace is only another term for ease. There should be great variety and poise; balance, control, ease, presence and bearing rather than posturing or feats of agility are the goal. Rightly conducted many of these choice

old dances which should here be revived are, perhaps, the very best basis on which the sexes in adolescent ages can meet. They palliate awkwardness, are formal enough to give a certain regimentation to this form of intercourse and place the two sexes on an exact equality. They also give a sense of social solidarity. While aiming to bring out all the delight that inheres in such cadenced movements to music, in themselves they should also aim to give pleasure to the beholder. Indeed, this latter element should never be absent. I know at least one young person who takes the greatest delight in choosing a musical selection and then working out with great ingenuity, phrase by phrase, with more changes than a poet makes in his lines, the suitable steps, pauses, turns, advances, recessions, bar by bar, until at last the music is set to a motor poem which fits it and nothing else. I have been surprised to see the great ingenuity displayed in this work, the sure rewards of patient and persistent effort, the extraordinary delight in repeating such a dance when perfect, and have myself felt an exquisite pleasure in seeing it. All this has nothing to do with the highly artificial dances of the drawing room, monotonous to the participants and wearying to the onlookers. No wonder we have complaints from many sources that fashionable dances are inane and unattractive, and who has not been struck with the joyless and almost dead faces often seen among those going thru these stereotyped functions? Only by beginning with the school and cultivating a taste for better things and the ability to achieve them can the ballroom be reformed and the evils that have gathered about this most artistic of all the forms of movement be eliminated.

Another end to be aimed at in teaching all children to dance should be the implanting of a habit of so doing that should last on into maturity, not to say old age. In Merrie Old England and in the palmy days of the great French dances, matrons with gray hair went thru the minuet and pavone with their grandchildren. Greece had dances for old men. Young people of high school age, especially girls who show the least sign of talent or genius in this field (for the domain gives the amplest scope for both), should be encouraged to elaborate original developments upon musical themes or to dance out songs and poems. For myself, I confess that I have rarely ever felt a greater or more wholesome exhilaration than upon the very few occasions, perhaps in the theater, in the midst of a Shakespeare play, possibly in witnessing a variety dancer (one in a hundred or two of whom show real creative genius in this respect), evolving a motor poem that is a surprise and delight, that has an esthetic value to the discriminating observer that is fully equal, if not superior, to the hadonic narcosis which Schopenhauer describes when in beholding a masterpiece of art, we forget all the woes of which, according to his pessimistic theory, we are ever weighted, save in these blissful moments. I have somewhere read an article written, I think, in the days when English statesmen sometimes forgot politics to practice the polka when it first came in and swept society almost off its feet, entitled "Dancing, the chief joy and the highest expression of life." I cannot find the article, but I can dimly imagine the many interesting and suggestive things that might be now said upon such a theme.

I think, too, that a selected course of dances of the essentially historic type, such as I have described, far above and almost the direct antithesis of the ballet, cakewalk and the ballroom dances, ought to be taught in church parlors and vestries, of course under proper supervision. Has the Church no duty to rescue dancing from its present degradation and should it rest content with pouring out the child with the bath? Does it forget that dancing originated in the religious instinct and was a form of religious service and that it is still capable of teaching reverence, awe, worship, that love of God is just as capable of motor expression as is romantic love? Not only this, but the present tendencies lead us to believe that this is inevitable and that in the near future. What we want first of all is more knowledge of what dancing has meant and can do, and I appeal to young clergymen and to directors of Y. M. C. A. associations to bestir and inform themselves, for the time is not far distant, unless I am mistaken, when they will be called upon to act in this matter.

WORCESTER, MASS.

Star Song

BY ROBERT UNDERWOOD JOHNSON

When sunset flows into golden glows
And the breath of the night is new,
Love, find afar eve's eager star—
That is my thought of you.

O tear-wet eye that scans the sky
Your lonely lattice thru:
Choose any one, from sun to sun—
That is my thought of you.

And when you wake at the morning's break
To rival rose and dew,
The star that stays till the leaping rays—
That is my thought of you.

Ay, tho by day they seem away
Beyond or cloud or blue,
From dawn to night unquenched their light—
As are my thoughts of you.

New York City.

A Reply to My Critics

BY THE "UNDISTINGUISHED HERETIC"

[In preparing this reply the "Undistinguished Heretic" has seen not only the criticisms of him that appeared in last week's Independent, but also the shoals of letters that came to us which we were unable to print.—Editor.]

I ACKNOWLEDGE the receipt of a severe and painful castigation administered at the hands of numerous readers of The Independent. Of the scores who have commented on my "Confessions," many condemn my opinions, but a larger number are outraged that a herald of truth should not proclaim all he believes without reservation or regard for consequences. A respectable minority agrees with me in doctrine, but many of these insist that I should out with all my heresy at once. Comparatively few encourage me that my position is tenable. Now whether a particular clergyman is an honest man, doing his duty in a difficult situation, or, on the contrary, a "hypocrite," "coward," "swindler and traitor," "a whited sepulcher" and "a Pharisee," is a matter of small general interest or importance, but how the great historic and evangelical Churches are to conduct themselves in relation to advanced Biblical criticism and its results, and whether it is possible for an orthodox minister to be in cordial sympathy with the more progressive scholars and continue his work peaceably and quietly, are questions of the gravest moment.

I would not, of course, assume that all sound scholarship questions the reliability of the accounts of the miraculous birth of Jesus and the reanimation of his body after death: it is still possible to appeal to authorities of the first rank who maintain that the gospel narratives of these events are thoroly historical. But the trend is unmistakably in the other direction, and unless some revolution occurs in the course of criticism, whose beginnings and sources are not now on the horizon, the Church must prepare to adjust herself to the conviction that the articles of the Apostles' Creed on the birth from a virgin and the rising after three days are no longer tenable, just as she has already adjusted herself to disbelief in the resurrection of the body, the descent into hell, the inerrancy of Scripture, and a host of other dogmas which have been cast off in the course of the centuries. Already a large number of clergymen in all orthodox churches, who have not sought out vagaries of opinion, but have simply endeavored, in discharge of their duty, to keep abreast of the times and to know the best that is thought and said by those who give their life to religious questions, have come to the conclusion that these doctrines are no longer certain. The question is, What shall these men do?

They might quietly withdraw, and at first thought this would seem the proper course. I believe most of them would have pluck enough to do it, and starve if need be. But how would such action affect the Church, and in what plight would it leave the thousands of laymen who are struggling with the same questions? It would simply serve notice on these men, whose name is legion, who are deeply religious at heart and who crave Christian fellowship, that there is no place for them in the Church of their fathers. It would proclaim to the world that on the part of the orthodox Church there can be no honest, free investigation of the most important questions of the gospel history, for investigation that is bound to issue in one opinion is not free and commands the respect of no one. To desert the Church because of enlightened opinion is the worst reproach one can offer to her. In the light of history such action were foolish and uncalled for. Orthodoxy is continually overtaking heresy, and was never closer on the vagrant's heels than today. Let advanced men wait a bit and be patient; it is quite probable that in later years they will themselves be fearsome lest the younger men are running ahead too far.

An alternative that presents itself to clergymen of orthodox connections is to betake themselves to the ampler folds of one of the liberal Churches. In the majority of cases, however, such a course would convey a wrong impression, if it did not even involve deception. To be sure there are those who drift from the Church of their fathers, but the majority of orthodox heretics have the spirit of their boyhood creed and worship inwrought in their very souls, and despite their doctrinal aberrancies the Church of their youth holds their heart. For myself I am an evangelical; I have a gospel which rings clear, which tells truth to the men of today, which offers real redemption in this hard-pressed, sin-afflicted world. Some will say I am inconsistent in holding to this gospel when there is so much to which I do not hold, but inconsistent or not I hold it, and it is the best thing about me, and I want the privilege of declaring it in the forms with which I most nearly agree and in the place in which I feel most at home.

Well, then, if I must stay where I am until some one comes to fetch me out, why not make a clean breast of all my doubts and "get on my own feet," as one brother strongly urges me, and as the greater number of my critics maintain is my duty? Because I sincerely believe that the worst thing that could happen in the American Church today would be for every ordinary parish clergyman, who happens to have a difference of opinion from that maintained by the Church as a whole and by many of his parishioners, to plunge into doctrinal discussion for the sake of relieving his conscience and with a view to establishing his view of truth. In particular I would count it a misfortune if the questions of the virgin birth and the resurrection were to come to the fore as the chief subjects of thought in religious circles. If there is one thing unprofitable above all things else it is theological controversy, and if there is one device calculated above

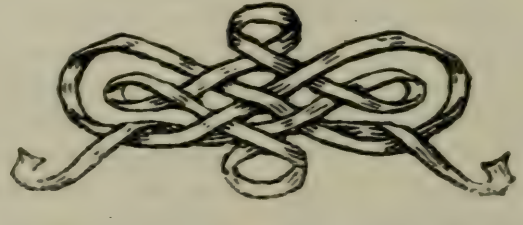
others to produce the atmosphere of the inferno on this footstool of God it is a contest over doctrine among neighbors and friends. Let scholars have freest liberty of investigation, and let them proclaim their results on platforms appointed for that purpose and in books which all may study. Let men of kindred spirit meet together in clubs and circles for patient search for the truth. Let parish ministers examine the facts without prejudice, change the terms of their preaching according to whatever light they gain, set forth the eternal realities of sin and righteousness and judgment in new forms if need be, prepare themselves for honest guidance of every inquiring mind, see to it that they establish the truth which every crumbling doctrine was designed to express, but above all things let them not belch out assertions that appear to the many only an utter disavowal of faith, if not a denial of God himself.

Consider what a parish church is under the conditions of our American life. It is not a company of students meeting regularly for the acquisition of knowledge and correct theory. Neither is it a club or society of people of one way of thinking, one type of mind. The American Church, in city or country, is a mixed assembly of cultured and ignorant, radical and conservative men, women and children. They are a unit in but one respect—the common desire to worship God, and thus receive help and encouragement in their aspiration for better things and in their efforts to live upright lives. The spokesman to such an assembly is in no position to set forth a new view of the origin of the Christian religion, either with justice to himself, or to his opinion, or to the people themselves. Attempt to do so is sure to result in painful misunderstandings and in utter misconceptions of the truth. This is not saying that a parish priest must leave his flock forever in the dark, but it does urge that "patience, tact and perseverance" be conscientiously employed in promotion of change in public opinion on religious matters.

In the more advanced sections of our country the fact that Moses did not write the Pentateuch nor Isaiah all of the book that bears his name is now generally accepted, or at least is a tolerated opinion. Yet only a few years ago men were disciplined for heresy for just those views. The change has not come about through sermons on the subject. Pulpits have very largely held aloof from the debate, and I maintain their course has been justified. The pulpit is not a place for critical argument nor for doctrinal discussion. It has other and higher uses, which are, to declare truth immediately cognizable of the conscience, to express the reverence of the soul before that which is worthy of worship, and to set forth the victory over the world which belongs to men of religious faith. This can be done by an orthodox clergyman without offense to the sensibilities of hearers of advanced opinion, and the same high task can be performed by those who are compelled to depart more than ordinarily from the creeds, without needless antagonism of those to whom the old is good enough, and also without compromise of a single conviction.

It is, after all, a question of time and place, rather than of the alternative between concealment and open blazonry. There are men in my parish who know my opinions to the full, and my ecclesiastical superiors are not ignorant of my position. Any troubled mind is free to the utmost help I can render, with frankest declaration on my part that there are many things I no longer believe. I endeavor to preach in such a manner that those who are in doubt and difficulty may receive light from what I say, and in good time, doubtless, what I now consider it inexpedient to declare will be spoken quietly, as if no one could call it in question. This is what my opponents may call traitorous undermining of the faith. But they are certainly mistaken, for I have preached long enough to see young men grow up into noble Christian character and life by faith I have thus "undermined," and by virtue of that same faith I have wrestled in prayer unto victory in more than one burdened home. After all, what is faith? A system to keep the same once and for all, or something to make men with?

When Professor Briggs was on trial for heresy, a pastor of a prominent parish in his branch of the Church declared



to a friend that he could have preached every one of the doctrines for which Dr. Briggs was condemned in his own conservative pulpit, provided only there had been no breeze a-stirring and he were given a little time. Suppose this clergyman had done so. Would he have been a "hypocrite" or a "coward"? Suppose it had taken him five years, or even ten. Would he have been a "wolf in sheep's clothing" all the time? I think rather he would have been a true pastor, a wise shepherd of souls. It is true Martin Luther nailed his theses to the door of Wittenberg Church, and also true that they killed 20,000 people on the awful day of St. Bartholomew in 1572, and that there were 143 Christian sects in the United States of America at the last official census. There are other ways of serving the God of truth than by nailing your opinions to the door of the Church. There is doubtless need in God's providence for startling heralds of a newer day, and perhaps even for doctrinal fighters, but the men called to that task are certainly few, and the work of a parish priest is rather to encourage love and good works in a quiet neighborhood, and to train the boys and girls to love God and keep His commandments.

Matthew Arnold was not over-reticent as to his religious beliefs, and the following counsel from his preface to "Literature and Dogma" is therefore all the more significant:

"There is no surer proof of a narrow and ill-instructed mind than to think and uphold that what a man takes to be the truth on religious matters is always to be proclaimed. Our truth on these matters, and likewise the error of others, is something so relative that the good or harm likely to be done by speaking ought always to be taken into account. 'I keep silence at many things,' said Goethe, 'for I would not mislead men, and am well content if others can find satisfaction in what gives me offense.' The man who believes that his truth on religious matters is so absolutely the truth, that say it when, and where, and to whom he will, he cannot but do good with it, is in our day almost always a man whose truth is half blunder and wholly useless."

This would seem to be the thought, also well expressed, of the "Practising Physician," who contends that I "argue aright." His concluding paragraph might well be taken as the ideal of every parish minister of quiet and progressive mind.

I wrote my "Confessions," and I make this reply in sincere desire to do good. I believe that very serious and trying days are before the orthodox Churches. Questions are on debate which will appear to many to affect faith in the incarnation and belief in immortality. Some of us can see how Jesus may still be regarded as the Savior and Redeemer of the world, in whom is life which is the light of men, and how the immortal hope may still burn brightly, even tho decision on these questions be unfavorable to prevailing sentiment in the Church. On the other hand, many believe the issues now at stake are more serious than ever before confronted the Church and that the very citadel of the faith is in danger. But the situation has looked serious before; new creeds have been written and old ones laid on the shelf, and men have still found the way to the Father. It is a time to keep steady. The historic Churches have been built up at great cost. Let not their ministers rend them asunder by controversy. Let not progressive men desert them because they seem backward. Let men of light and leading help them do their true and proper work, and to stand in the world, not for the fact that Biblical history has made a few mistakes, but for the great redemption of God, which seizes hold of a bad man and makes him good and which speaks to the troubled heart a strange and blessed peace.

Hawaii's Example to California

BY FRANCIS W. DAMON

[We are very glad to publish the following illuminating article showing Hawaii's remarkable success in educating Oriental children in her public schools. It would seem to show that California's fears on the subject are absolutely groundless. Now that the Board of Education of San Francisco has gone to Washington to take up the Japanese school question with the National Government, this article should prove timely, instructive and suggestive.—EDITOR.]

IT is a fact of no little importance that in the Territory of Hawaii, in the midst of the great Pacific Ocean, two thousand miles distant from the continent of America, is being solved one of the most interesting educational problems to be found anywhere in the world. Here in our public and private schools are gathered with the children of the aboriginal race representatives of a number of different nationalities, a fine youthful democracy, which, tho itself unconscious of the fact, offers some valuable data, not alone to the professional educator, but to all thoughtful men and women. Especially will support for his theories here be found by the lover of the human race, who believes that no insuperable barriers exist to the final harmonious intercourse of all peoples, provided that right influences are imparted at a sufficiently early and receptive period of life, in contact with a sound and healthy environment, animated by at least a fair approximation to the spirit of the "Golden Rule."

FRANCIS W. DAMON.

Certainly it will be conceded that the problem here offered is a sufficiently varied one, when the international complexion of our schools is considered. We find Hawaiian, part Hawaiian in many combinations, American, British, Portuguese, Scandinavian, German, Japanese, Chinese, Porto Rican, Korean and "other foreign" pupils gathered in our schools, pursuing the same studies, accorded equal privileges and happily and with increasing, rather than lessening, harmony laying the foundation of a good and helpful education. It is proposed here, however, not to attempt more than to present a brief statement, with reference to one element here found, namely, the Chinese.

Nowhere in the world is to be found a similar number of young people of Chinese and Japanese origin, at the most formative period of their lives, in the heart of a community equally penetrated with and animated by Anglo-Saxon principles and ideals. Out of a school attendance of something over 21,000, there are to be found over 6,000 pupils of Asiatic parentage. Of these it will be found, by the very latest statistics obtainable from the Board of Education,

that 4,297 are Japanese and 2,092 are Chinese. While the Japanese are largely in the majority numerically, yet owing to the fact that the Chinese have been a much longer time represented in the population of Hawaii, and have more fully assimilated with certain phases of our life, and are more numerously represented in our more advanced institutions of learning, the results of the working of the educational system here are probably more manifest among the young Chinese than the Japanese.

The interesting work which is being carried on among the young people whose parents came to these islands from China, but who are themselves in very many instances native sons, entitled to full citizenship under the "Stars and Stripes," is worthy of careful attention. Hawaii occupies a position in the world's attention quite out of proportion to the extent of its territory or the size of its population. The varied and striking features attending the historic development of its interesting and amiable aboriginal population, as a civilized and Christianized people; its beautiful and romantic scenery, and its important and strategic position, politically and commercially, have long drawn the attention of many to these "isles of the sea." It is, however, possible that one of the most conspicuous claims which it can make to a place in the world's kindly regard is to be found in the gracious courtesy which has always been shown representatives of different races who have here, in this land of "perpetual summer," found a home and abiding place. Truly it may be said that the noble and comprehensive word, "Reciprocity," in which Confucius found the embodiment of all that is highest and best in life, has here found, in the care of his countrymen, a larger and more expanded signification than even he felt was expressed by it. Thousands of Chinese laborers, accompanied by a far too small percentage of women, yet in not a few instances with the companionship of true and worthy wives, were brought to these shores, at the earnest request of our authorities, to aid in the agricultural development of these islands, especially in connection with their principal industry, the manufacture of sugar. In addition to these have also come representatives of the merchant class, who have to some extent brought their wives with them—or have married in these islands. Much does Hawaii owe to the Chinese in the successful attainment of a large share of her present prosperity, and the debt due their patient, faithful and unwearied labor should never be lost sight of. Their children in turn are receiving a broad and liberal education under conditions peculiarly generous and favorable. This wise and considerate treatment is creating most satisfactory results, not alone to the Chinese themselves, but is producing a class of young citizens who are a credit to the country in which they dwell, and is setting in motion circles of influence for good which will cross the ocean and aid in the uplift of great peoples and thus minister in blessing to the whole human race. Surely in no nobler or more beneficent work could Hawaii have a share!

The first aid which the Chinese here received educationally was at the hands of missionary workers, who have for many years and in varied forms, adapted to meet all, even the humblest, endeavored to impart the advantages of a Christian training. A small school was started more than fifty years ago, followed by many week-night and Sabbath schools, all over the islands. Scores and hundreds of young men have thus received the rudiments of an English education, and from their ranks have come some of the most worthy and respectable members of our Chinese community. Similar schools are still conducted by different missions.

The arrival of the first families, in any appreciable numbers, dates from 1865. Later mission day schools were started for the children by the Congregational mission, aided for some years by a Government grant. In 1888, these schools, in the city of Honolulu, were taken over by the Board of Education and incorporated with the public school system.

The first free kindergarten for Chinese children anywhere in the world was opened in Honolulu in 1892—the pioneer of this department of effort in Hawaii. Two years later the first kindergarten in the Chinese Empire was started. This one in Honolulu for Chinese was fol-

lowed by others for the children of different races here gathered. Later these were all merged in one general kindergarten system, regardless of nationalities. No more picturesque and interesting sight does this beautiful city of Honolulu offer than these numerously attended free kindergartens, scattered over the town, where the bright-eyed representatives of five or six different races meet. A number of our Chinese young ladies have been connected with the kindergarten work and have proven themselves to be excellent assistants. A brief quotation relative to the kindergarten from an essay of a Chinese young lady, now an instructor in one of the public schools, which she recently wrote with reference to the educational advantages afforded Chinese girls in Hawaii, will, in this connection, be of interest:

"The Chinese mother takes the hands of the little toddlers (brother and sister) and guides them to the Kindergarten, where both are seated around a little table with other little ones of their own age, some with blue eyes and golden curls, with brown eyes and auburn hair, but our black eyed darlings feel as much at home with these foreign babies as they would if each pair of eyes were sparkling black and each curly pate was wreathed round with a braided queue. Froebel, were he living and had the blessed opportunity of seeing such a gathering of wee tots, would doubtless have felt that such a result was far beyond his most sanguine expectations."

A wise educational policy has led to the admission of our Chinese children to the public schools, where they advance thru the successive grades, a credit to themselves and to the land which has shown them a courteous treatment. In the large public schools of the city and the smaller ones of the country they are pursuing their studies and mingling harmoniously with the thousands of other pupils here gathered. They stand well in their classes and are among the most satisfactory students. The following statements from the principals of the leading public schools of Honolulu, men

GROUP OF CHINESE YOUNG LADIES, GRADUATES OF DIFFERENT SCHOOLS IN HAWAII.

and women of experience and careful judgment, are of much interest and value. One writes:

"In our school of over six hundred pupils, the influence of the Chinese boys and girls who comprise one-fourth of our enrollment is most beneficially felt. They set a high standard in faithful scholarship, earnestness of purpose, gentleness of demeanor toward their fellow-students and respectful and grateful appreciation toward their teachers."

The statement from another is as follows:

"The Chinese children from six years old to sixteen are satisfactory to the teachers in every way. They are studious and attentive, very rarely making an infraction of discipline. Certainly the virtue of gratitude prevails among them more than in any other race and their habits are an incentive to the progress of their fellow-students. In this particular school the Chinese children have decreased in numbers in the past few years and those who attend are assimilating with the others in so rapid a manner that individuality is not noticed to the degree it was formerly."

A third gives this as his estimate:

"In reply to your question as to the influence of the Chinese pupils upon the schools of this Territory I would say that years of experience and observation in the schools of Hawaii have led me to the following opinion:

"The Chinese boys and girls enter the schools with the purpose of making the most of their opportunity. They live up to this purpose by being courteous, corrigible and diligent, and the example they set in doing this has a most benefiting influence upon their fellow-students. They are highly appreciated by both teachers and schoolmates. Their career after leaving school is very creditable indeed. Very few go wrong."

Still another statement runs as follows:

"In the schoolroom the Chinese girls and boys show a great thirst for knowledge and an enthusiasm which is most encouraging to the teacher. They especially like any study which has definite results, as mathematics.

"On the playground the boys show a decided interest in sports. The girls, who are still handicapped by the restraint of their mothers' narrow lives, are shy about entering into the games. However, when they do throw aside their natural bashfulness and decide to have fun and enjoyment as the boys do, the teacher feels that they are taking great strides toward freedom."

In the more advanced schools their record is equally satisfactory. In the High School of Honolulu, where there are a number of Chinese students at the present time, the principal gladly pays them this fine tribute:

"As students I find the Chinese young men truthful, persistent, courteous to their companions and deferential to their teachers. I believe that their average capacity is equal to that of their white brethren. Their power of application far exceeds that of American youth. This power, coupled with their good conduct, makes them favorites with all teachers."

The principal of the Normal School, one of our most important and progressive institutions, says:

'Since the organization of the Normal School in 1895 there have been enrolled fifty-seven pupils of Chinese or part Chinese extraction. Of this number, not more than 10 per cent. have failed either in the academic or professional work of the school. There are at the present time nineteen Chinese or part Chinese connected with the Training School.

"In the work of teaching, the Chinese cadet is thorough in the preparation of his work, prompt in the discharge of his duties, but possibly a little harsh in his bearing toward the pupils under his care. This fault, however, largely disappears with training. The Chinese Hawaiian cadet does good work in all departments of the school, but has a special aptitude for teaching. His appearance before the class is good, and the children give him a willing obedience. In nature study, music and drawing he is especially strong. As an assistant teacher he is willing and capable."

The president of Oahu College, the leading private educational institution in the Territory, where there are between thirty and forty Chinese students in the preparatory and high school departments, writes of them as follows:

"For many years Oahu College, which is primarily a school for white children, but which accepts students of other nationalities who are able to meet our standards, has had a limited and somewhat selected number of Chinese young men and young women among its students. They have taken the regular courses, and, on the whole, they have acquitted themselves well. A large percentage of them have been above the average in scholarship. They excel in scientific and mathematical subjects requiring accuracy rather than breadth of view or imagination. In English, without the inheritance of generations and without practice in good English in their home life, they make the poorest showing by comparison. But even in this subject the marvel is, not that they do no better, but that they do so well. They soon master the grammar and make a very creditable showing in oral and written expression and in the use of the English idiom.

"In conduct they are exemplary. They are industrious, eager, earnest seekers after everything that will improve them in body or in mind. There is rarely any question as to their ambition and willingness to work; when there is a failure it is usually due to conditions beyond their control—to lack of ability or training sufficient for the task, or to inherited tendencies too strong to be overcome. Among

our students, it is now generally conceded that in every competition, whether on the athletic field, in the classroom, or in contests in speaking, they are factors to be reckoned with.

"The change of conditions in China has been reflected considerably in the attitude of our Chinese students. There has come an increased zeal for a training, either along commercial lines or in broader academic courses leading to admission to Eastern colleges, that will better fit them for a place in the great progressive movement of the awakened Empire."

It has not been the purpose of this article to call special attention to the work of mission schools, great and far reaching as this has been. Yet among the most important agencies, which have been in Hawaii of great value in the education of Chinese youth, have been certain mission boarding schools. The Episcopal institution, "Iolani College," and the Roman Catholic College, "St. Louis," have had for years many Chinese on their rolls, where they have received the kind and helpful care accorded other students. The "Mills Institute," affiliated with the work of the Hawaiian Board (Congregational), has been devoted especially to the education of Oriental youth, the Chinese having always been largely in the majority, tho among the students have been some most interesting and studious Japanese and Koreans. Over four hundred Chinese young men and boys have been connected with the "Institute," with the "boarding department" since its opening, while a large number of day-pupils have also been in attendance. Among its graduates are fine and earnest specimens of true and noble manhood. They are here in Hawaii and in China occupying positions of trust and usefulness or in institutions of more advanced learning on the mainland, pursuing further courses of study with diligence and success. Years of contact with them, intimate knowledge of them in recitation hall, and athletic field, and in the friendly fellowship of the home-life, enable their instructors to speak warmly and sincerely of them as being in very many in-

THE CHINESE STUDENTS' ALLIANCE OF HAWAII.

stances students of high and noble ideals, of earnest purpose, and excellent attainment, of grateful appreciation of kindness shown, and comparing favorably and well with schoolboys of other nationalities. Some of our Chinese young ladies have also received excellent training in different seminaries for girls.

A most interesting organization has lately been formed among the Chinese young people in Hawaii who have been privileged to receive the benefit of a good, early education, namely, a branch of the "World's Chinese Students' Federation," the headquarters of which are in Shanghai. In its membership are not a few who are earnestly desirous of pursuing more advanced courses of study.

Many important questions naturally arise with reference to the education of youth of Asiatic origin under the American flag. In regard to one of these an important and valuable statement has recently been made by one of Hawaii's foremost educators in a report to the Governor of the Territory. This has already been published, yet it is well to give it still further circulation. Prof. M. M. Scott, well known for his long and successful career as an instructor of youth in Japan and Hawaii, a careful and earnest student of public affairs, and one who thoughtfully weighs his utterances, says:

"The question is, What instrumentalities can be brought to bear upon them (Chinese and Japanese children in the Territory of Hawaii) that will make them good American citizens? Is it possible for the State and society to take the children of races so diverse from Americans as are the Japanese and Chinese and by some educational, social and political crucible fuse them and turn them out homogeneous Americans?

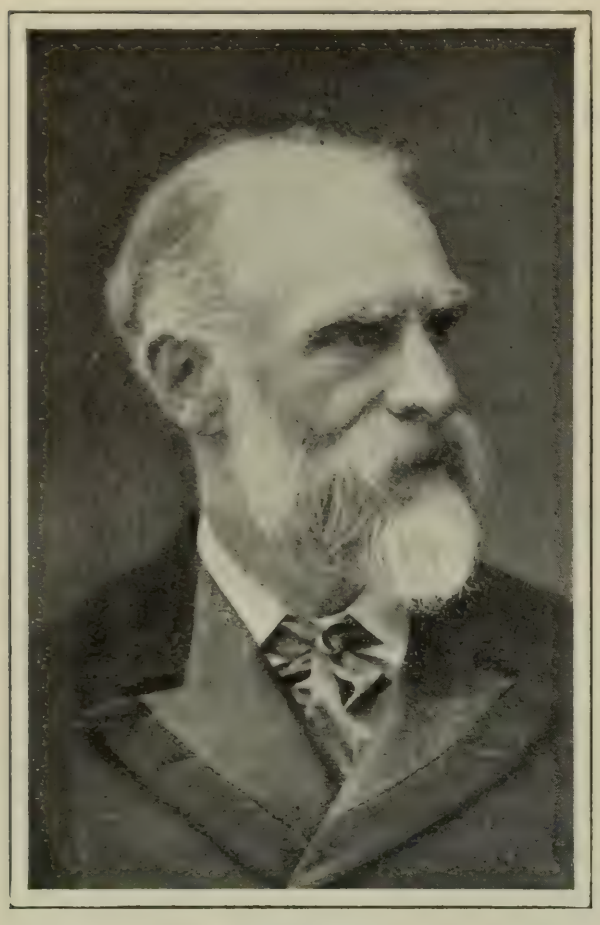
"This is the practical and very interesting problem that presents itself to the people of this Territory, the solution of which is sought by both statesmen and social philosophers. There is no better place than Hawaii for an experiment of this kind. The country is small in area. The population is limited. The Orientals come into daily contact with Americans, men and women of light, and leading in every relation of life. The old missionary set the example which the man of business and of industry has, to a large extent, followed. The Chinese have always been treated here in decided contrast with the treatment they have received in California. By the advice of the early missionaries, and through their organing power, the King and Legislature made provision for an excellent system of public schools. That system, modernized and improved, is the fundamental agency by which the children of the diverse nationalities of Hawaii are to be trained, reared and transfused into American citizenship.

"Can it be done? The most thoughtful educators of this Territory answer, emphatically, Yes. It is being done now. It has been done. Both Chinese and Japanese born and nurtured in Hawaii are among our best citizens. They hold and exercise the franchise. They are industrious, accumulate property, are charitable and law-abiding.

"They seem to select and vote for, as if by unerring instinct, the best men for office. The children of the Territory meet in the schoolroom, the playground, the church, the Sunday school. They sing the same patriotic American songs. They read American history and literature. The higher grades are well instructed in the principles and practice of free government—National, State and Territorial. It is the unanimous testimony of the teachers that no class of children respond more readily and intelligently to both moral and intellectual instruction than do the Orientals."

In view of the educational advantages here given to our Chinese youth, it is a pleasure to know that they are appreciated by the recipients. Surely the following expression of gratitude from one of their own number would lead us to feel that our efforts are not bestowed in vain:

"Side by side with our American brothers and sisters our Chinese young people walk upward. No caste, no class—privileges equal to all. All doors to the best and purest society in Hawaii are opened to them because they are prepared to do well and nobly the part in life assigned to them, and they desire to make the world better for having lived in it."



HONOLULU, HAWAIIAN ISLANDS.

The Fateful Coming Session in Westminster

BY JUSTIN McCARTHY

WE are already looking out eagerly for the opening of the Parliamentary session. The session can hardly fail to be rich in legislative proposals of the highest importance and to call forth most thrilling debates. At the first glance it might seem, indeed, as if the Liberal Government could well be assured of their power to carry everything before them without anything like practical opposition from the Conservative party. The Liberals have a majority in the House of Commons the like of which has not been known before, and as a matter of course the Conservatives are therefore in an unprecedented minority. The Liberals have most capable leaders, while the Conservatives might be described with almost literal accuracy as having just now no leaders either capable or incapable. Joseph Chamberlain is still believed on both sides of the House to have closed his political career, while Arthur James Balfour has lately been giving up even the attempt to maintain the leadership of his party, the Conservative cause losing in each case the influence and the guidance of a man of great capacity.

But when we consider the prospects of the coming session we have to bear in mind that the Liberals are about to undertake the settlement of some momentous questions, on which Liberalism itself is far from being of one mind. First of all, it may be taken for granted that the Government will introduce a measure of Home Rule for Ireland. Now, I should say at once that the Government will in all probability not bring forward such a measure as avowedly a scheme for the establishment of actual Home Rule in Ireland. It will be described probably as a measure of devolution—"devolution" being a word much in favor of late among Liberals, who see clearly that something must be done to reorganize the whole system of Ireland's administration, but do not like to commit themselves to the principle of Home Rule. Now, I have not the slightest doubt that the measure as first introduced will be only an attempt at a settlement, which the Government cannot hope to make acceptable to the Irish National party, but which they will be willing to expand and to improve, in the hope of coming during the session to something like a satisfactory settlement. But the great question is whether the Liberal leaders will or will not be ready or be able to offer for Ireland's acceptance that one plan of legislation which the Irish representatives and the Irish people would be willing to accept. No mere improvement in the constitution of Ireland's system of local government could possibly have that effect. Ireland will have nothing short of the right to govern her own affairs by the acts of an Irish National Parliament. If Sir Henry Campbell-Bannerman and his colleagues cannot see their way to accept and adopt the principal of genuine Home Rule, they will lose the support of the Irish National representatives. The difficulty seems to me to be found in the fact that a great many British Liberals, who fully admit that Ireland's present system of government is indefensible and intolerable, are yet not by any means prepared to vote for the creation of an Irish National Parliament. I cannot think very highly of the intelligence and the foresight of such British Liberals, because I think it ought to be obvious now at last to all reasonable mortals that the coming of genuine Home Rule for Ireland by means of an Irish National Parliament is a certain event in the near future. But we must expect to find the Liberal leaders likely to be somewhat discouraged by the fears and the objections of those hesitating and nerveless Liberals whose numbers are considerable in England at least, and may thus endeavor to obtain something like a compromise where compromise is abso-

JAMES BRYCE.

lutely impossible. Then the Government will have to consider the course which ought to be taken with regard to the House of Lords. Are the Lords to be allowed to deal with the Home Rule measure when it is sent up to them as they dealt with the education measure of the past session and turn it into something quite different from that which its authors intended it to be? Or are they to be dealt with themselves by the House of Commons through the means of some enactment for the purpose of limiting their powers and preventing them from having an absolute supremacy, even if only a temporary supremacy, over every measure passed by the representative assembly? I need hardly tell my readers that this question alone will give most important and exacting work to the House of Commons in the coming session and will afford abundant opportunity for timid Liberals to swerve from their official leaders.

Then, again, it is understood that the Government are resolved to deal at once —I mean within the coming session— with the important subject of publicans' licenses, in order that the great cause of national temperance may be promoted by some serious limitation of the power now given to the owners of public houses to facilitate, encourage and foster habits of intemperance among so many classes of our populations. Now, any American reader who knows something about England in general and London in particular, cannot help knowing how great, how immense, is the influence of the makers and the vendors of intoxicating liquors over a vast mass of the English, Scotch and Irish people. Therefore, it will easily be seen that the Government will have

MRS. CRAIGIE.
("John Oliver Hobbes.")

some perilous enterprises to undertake in the coming session. I feel well convinced myself that they will set to their work loyally and will accomplish it effectively, but they will have to navigate a very perilous sea before they can bring all their vessels safely into port.

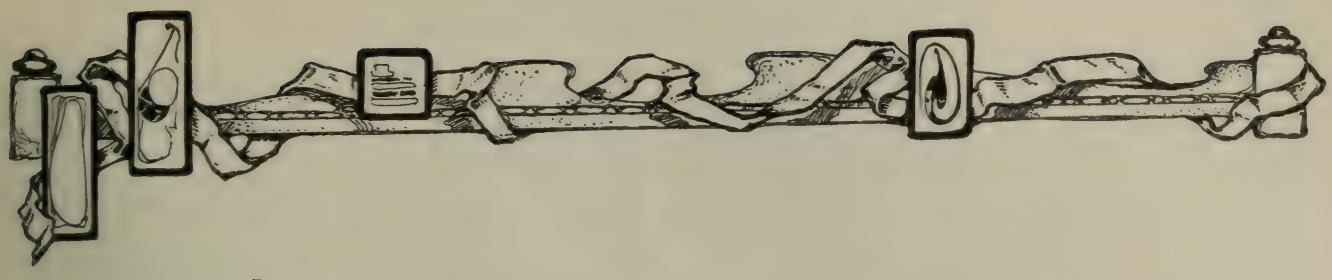
Meanwhile the name of James Bryce, the celebrated historian, and one of the most distinguished members of the Liberal Government, is on the lips of every one who takes any interest in political affairs. As the readers of THE INDEPENDENT already know, James Bryce, who was lately occupying the office of Chief Secretary to the Lord Lieutenant

of Ireland, is about to be sent to Washington as British Ambassador, and a successor will have to be appointed to the Irish office. I feel thoroly satisfied that Bryce will receive a most cordial welcome in Washington and from the whole American people, for his great historical works are as well known in the United States as they are here. He knows America himself, and has been a traveler over many parts of the earth, and must have made admiring friends wherever he went. There is a sort of divided feeling here with regard to this new appointment. We are all delighted that such a man should be sent on such an embassy and at the same time we cannot help feeling some regret that James Bryce should be withdrawn, even for a time, from the scene of his brilliant successes in Westminster. Much conjecture is still going on as to the appointment of his successor, which, if it has already been decided upon, has not up to the time at which I am now writing, been officially announced. The general impression is that his successor will be Augustine Birrell, author of the ever popular "Obiter Dicta," distinguished scholar and experienced professor, who during his Parliamentary life soon proved himself to be one of the most brilliant debaters in the House of Commons. Birrell holds at present the office of Minister of Education, and it was on him that devolved the exacting and one might almost say exhausting task of carrying thru the House of Commons that measure of education which was reduced to nothing by the House of Lords. Birrell is one of the most genial, witty and charming men whom I have known, and he ought to be thoroly welcome in Ireland, for he has thruout the whole of his public career been a resolute Home Ruler.

WINSTON CHURCHILL.

There were many rumors to the effect that the Irish office was to be conferred not on Augustine Birrell, but on Winston Churchill, now Under Secretary for the Colonies, and son of the late Lord Randolph Churchill, whose biography he has lately written in most effective and impartial and yet picturesque and fascinating style. Winston Churchill would unquestionably be well received in Ireland, because of his conscientious adoption of thoro Liberal principles and of the Home Rule doctrine, and every one remembers that his father was a great friend to Ireland and numbered some Home Rule Irish representatives among his close personal associates. The probability, the almost certainty, seems, however, to be that Augustine Birrell is to be sent to Ireland, and I cannot doubt will prove a success for him and for the country in whose administration he is to take an active part.

Passing away from politics, I may mention the fact that a movement has begun in this country for a memorial to the late Mrs. Craigie, known to literature as "John Oliver Hobbes." The idea is that a fund should be raised for the purpose of having a portrait *plaque* in marble or bronze, to be given to the London University College, where Mrs. Craigie studied, and for a reproduction of this effigy to be sent to the United States and also for the foundation of a scholarship in honor of Mrs. Craigie in England and in the States. The list of the committee for the carrying out of this purpose includes many distinguished names in letters, arts and society. The American Ambassador, Mr. Whitelaw Reid, is one of the number, and the list also has the



names of Augustine Birrell, Winston Churchill, Lord Curzon of Kedleston, Anthony Hope, T. P. O'Connor, T. Fisher Unwin, the Duchess of Sutherland and Miss Ellen Terry. I need hardly say that I cordially wish every success to this excellent movement. I knew the late Mrs. Craigie well, and much admired her writings and her genuine sympathy with the cause of literature and the cause of humanity, and I think that the tribute about to be offered to her memory is in every sense appropriate.

Among the latest additions in London to the literature of fiction is "The Eight Guests," by Percy White, author of several brilliant and successful novels. The book is published by Messrs. Archibald Constable & Co., London. "The Eight Guests" may be fairly described as a satire upon a certain set in the London world of fashion. It might indeed perhaps be described by unfriendly critics as a caricature, but then we must bear in mind the fact that even caricature may perform at once a thoroly artistic and a thoroly moral part in holding up to ridicule some of the unworthy fashions of a time. Caricature necessarily exaggerates, but does not necessarily falsify the peculiarities and the personages which it undertakes to illustrate, and altho Mr. Percy White has indulged in some caricature when describing the oddities, the follies and the graver errors of those in London who worship money or worship rank, or worship both together, he has, on the whole, given us a vivid, an amusing and an effective exhibition from the satirist's point of view of those groups of society which make up the personages in his living picture. I do not propose to offer to my readers a condensed version of Percy White's story, but I may go so far as to say that the principal figures in it are the members of a society formed in London and called "The Enlighteners"—a society made up of dukes and duchesses and other personages of rank and family who are going in for being considered intellectual as well as aristocratic, and on the other hand of Mr. Marcus Hart, a multi-millionaire, born in the Whitechapel region of London, who in his early manhood went out to Chicago and made an immense fortune there and then at the age of forty returned, and, as Mr. White puts it, "descended on his native city (this time on the Mayfair side of it) to enjoy his victories in golden leisure." The Enlighteners take up Mr. Hart, and Mr. Hart accepts the patronage of The Enlighteners. Everybody wants to make money out of Mr. Hart, and Mr. Hart wants to get some gain out of everybody. Mr. Hart is disappointed and thereupon resolves to punish his enlightening patrons, and there begins the plot of the story. The book is rich in humor, the figures are all well drawn and life-like, the *denouement* is not perhaps quite so well worked out as those passages in the story which lead up to it, but the book, on the whole, will sustain and even enhance the reputation of its author, and is sure to be read with interest on both sides of the Atlantic.

"Studies in Biography" is the title of a large and handsome volume by Sir Spencer Walpole, which Mr. T. Fisher Unwin has just published in London. The book contains biographical studies of Sir Robert Peel, Richard Cobden, Disraeli, Lord Dufferin, Edward Gibbon, Prince Bismarck, Napoleon III and other prominent figures in modern history. I have only just obtained a copy of this work, and shall not now attempt to do any more than merely announce its publication. In my next article I hope to give my American readers some account of the impressions made upon me by these "Studies in Biography."

London, England.

Is Jack London a Plagiarist?

BY L. A. M. BOSWORTH AND JACK LONDON

[Our attention having been called by Mrs. Bosworth to the following interesting case of parallelism we wrote Mr. London in regard to it and his frank reply seemed to us worth publishing because it brings up in a new form the old question of the right of an author to take his material where he finds it. Our readers will remember that Mr. London has recently been accused of plagiarizing part of his current novel, "Before Adam," from Stanley Waterloo's "Story of Ab, the Cave-Man." His defense reminds one of Kipling's reply to similar charges:

"When 'Omer smote 'is bloomin' lyre,
He'd 'eard men sing by land and sea;
An' what he thot 'e might require,
'E went an' took—the same as me!
"The market-girls an' fishermen,
The shepherds an' the sailors, too,
They 'earn old songs turn up again
But kep' it quiet—same as you!
"They knew 'e stole; 'e knew they knowed,
They didn't tell, nor make a fuss,
But winked at 'Omer down the road,
An' 'e winked back—the same as us."

EDITOR.]

IN the year 1902 there appeared a book written by Egerton R. Young, a missionary to the Indians in the region of Lake Winnipeg, in the Dominion of Canada. Altho put forth without any great pretensions of style, this simple true tale, "My Dogs in the Northland," made a large place for itself among dog-lovers, while it was not without its dramatic situations and moments of intense interest for the general reader.

The month of July of the year 1903 was marked by the publication of another dog book. Jack London's "The Call of the Wild" may not fully justify the term "classic," which has been applied to it. Yet few books have attained the prompt and continued popularity of this strange work, with its three-fold appeal—to the love of animals, to a taste for entertaining literature, and to the universal appetite for romance—*plus* the subtle suggestion that there is in it more than a dog story, more than literature, more than the wild romance of the Klondike region.

But there are some peculiar things about a portion of the material of "The Call of the Wild." Placed beside "My Dogs in the Northland," it shows certain startling resemblances to the latter book, marked similarities in the personnel of the leading dog characters, and in circumstances and situations, tho far inferior to it in delineations of dog nature.

One can scarcely fail to see the likeness between the combined characteristics of Dr. Young's brave, strong, intelligent "Jack" and his "Rovers" I and II, and those of Jack London's "Buck."

Some of the striking similarities are as follows:

"He was a magnificent St. Bernard dog, and his name was Jack." He was "accompanied by a very beautiful Newfoundland dog, whose name was Cuffy." "of the short, curly-haired variety." "I did not have the slightest trouble in breaking him into his work in the harness." (My Dogs in the Northland, pp. 66, 125, 69.)

The father of Buck was "a huge St. Bernard." "Curly, a good-natured Newfoundland," was "led away" with him. In the harness "Buck learned easily." (The Call of the Wild, pp. 18, 34, 47.)

Dr. Young's Rover I developed a striking peculiarity in his "preparations for his night's lodgings." "He would . . . get up on some snow-covered rock or fallen tree and there sniff until he had exactly found the direction from which the air was coming. . . . So calm at times was the air that the smoke and sparks from our camp fire ascended so perpendicularly that apparently there was not the slightest movement in the atmosphere. Yet, Rover selected his camping place on the lee side so accurately that when, as it often happened some hours after, the wind rose, it never caught him sleeping in an exposed place." (My Dogs in the Northland, p. 176.)

Buck's "most conspicuous trait was an ability to scent the wind and forecast it a night in advance. No matter how breathless the air . . . the wind that later blew inevitably found him to leeward, sheltered and snug." (The Call of the Wild, p. 61.)

"When the cozy sheltered spot was decided upon, Rover set to work to make it habitable." He then "curled round and round in his . . . nest and rested until the . . . call to supper brought him" to receive his "allowance of two well thawed fish. . . . When at length Rover had eaten his full allowance he would leisurely return to his . . . resting place in the snow, and almost invariably found it occupied." (My Dogs in the Northland, pp. 176-178.)

"Close in under the sheltering rock Buck made his nest. So snug and warm was it, that he was loath to leave it when Françoise distributed the fish, which he had first thawed over the fire. But when Buck finished his ration and returned, he found his nest occupied." (The Call of the Wild, pp. 68, 69.)

"Rover constituted himself the surgeon doctor of my other dogs. . . . Nature has so arranged that a dog's tongue is his great instrument for cleansing and healing his wounds. . . . The instant a dog was unharnessed, Rover . . . would overhaul him . . . and quickly find the galled or wounded spots. Very gently then he licked them." (My Dogs in the Northland, pp. 180, 181.)

"Skeet . . . had the doctor trait . . . and as a mother cat washes her kittens, so she washed and cleansed Buck's wounds." (The Call of the Wild, p. 162.)

The missionary had a dog, who, he says, was "not what might be called handsome," and one of whose eyes had been destroyed. "He ever resented being silently approached on his blind side." "He was never an affectionate or playful dog. A petting he considered an insult. Kind words he treated with scorn. . . . He was never seen to play with the other dogs." (My Dogs in the Northland, p. 144.)

Jack London introduces a dog "with a battle-scarred face and a single eye," who "asked nothing, gave nothing, expected nothing." "He was called Sol-leks. . . . The Angry One." "He had one peculiarity . . . he did not like to be approached on his blind side." (The Call of the Wild, p. 48.)

Speaking of the cries of the Eskimo dogs at night, Dr. Young says: "These strange, weird howlings would begin about nine o'clock . . . At first it sounded very eerie-like, and not unmusical . . . like a succession of O-O-O-O's, long-drawn out, rising and falling on the clear frosty air." But as others took up "the doleful notes," it became "the most ear-splitting din that ever mortals heard. . . . At about midnight these horrid choruses were repeated, and then again at about three o'clock in the morning." (My Dogs in the Northland, pp. 20, 21.)

Jack London: "Every night, regularly, at nine, at twelve, at three, they lifted a nocturnal song, a weird and eerie chant . . . pitched in minor key with long-drawn wailings and half-sobs." (The Call of the Wild, p. 84.)

Rover II was a great Newfoundland, given to Dr. Young by a friend. He was "packed in a large box-like case and forwarded by express." "It was the third day ere the dog arrived at his destination," and "he had had neither food nor drink. The result was that he had become simply furious" and "four expressmen were needed"

While Buck was on the way to Seattle in his "cage-like crate," "for two days and nights he neither ate nor drank, and during those two days and nights . . . he was metamorphosed into a raging fiend." On his arrival "four men gingerly carried the crate . . . into a small, high-walled back yard. A stout man . . . brought a hatchet and a club. 'You ain't going to take him out now?' the driver asked. 'Sure,' the man replied, driving the hatchet into the crate. . . . There was an instantaneous scattering of the four men who had carried it in, and from safe perches on top of the wall they prepared to watch the performance. Buck rushed at the splintering wood, sinking his teeth into it, surging and wrestling with it. Wherever the hatchet fell on the outside, there he was on the inside. . . . When the man had made an opening sufficient for the passage of Buck's body . . . he dropped the hatchet and shifted the club to his right hand. 'He's no slouch at dog-breakin', that's wot I say,' one of the men on the wall cried enthusiastically," when Buck "crumpled up and went down" under the last cruel blow dealt by the dog-breaker. "When the man brought him water he drank eagerly, and later bolted a generous meal of raw meat, chunk by chunk from the man's hand." (The Call of the Wild, pp. 26, 27, 32.)

for his delivery. " 'Well, what are you going to do with him?' " asked one of the men of the doctor, who came forward to receive him, and who proceeds with the story as follows: " 'First of all,' I replied, 'I am going to get him out of that big box.' . . . 'Well, just wait until we get out of this, will you?' . . . So while I made preparations to relieve the dog, these four men . . . drove out of the yard. Then shutting the high close gate, they took their position on the top of the wall to see me 'devoured by that dog.' " The missionary provided himself with an ax, a "generous" supply of meat, and a bucket of water, and began to cut into the packing case. "At first every blow and word seemed to make the dog, if possible, more wild and furious. At every blow struck on the outside of the box, he would spring at the place inside." When the moment of release came, "dropping my axe and placing the pail of water close at hand, I suddenly jerked back the board," and "almost before he knew where he was I had his head in that pail of water, and for the first time in my life I saw a dog drink like a horse. . . . I had my meat dish handy, and I fed him out of my hand piece by piece. . . . 'That beats Barnum,' said one of the four men, as they all clambered down off the wall." (My Dogs in the Northland, pp. 184-190.)

The humane methods of the dog-loving missionary in subduing Rover's rage were not to the purpose of the novelist. There is, however, an account of a battle. Dr. Young was on one occasion forced to fight with Jack, as the enraged dog "sprang viciously" at his master's throat, which would answer well as the model for the story of the big man of Seattle, as he met the attack of the hunger-and-thirst-crazed Buck, when he burst from the crate.

In the missionary's account of his fight for his life with Jack: "Again and again he came for me. Again and again he went down under the powerful blows." In the end "the great big fellow lay sprawled out on the ground and coolly looking at me. Now for the first time since the commencement of the conflict, I spoke to him." While talking "I stretched out one of my hands to him, and at once he began

Of Buck Jack London says: "Straight at the man he launched his one hundred and forty pounds of fury." "A dozen times he charged, and as often the club broke the charge and smashed him down." When at length his strength was gone, he "lay where he had fallen, and from there watched the man." Then the man addressed the dog, and "as he spoke he fearlessly patted the head he had so mercilessly pounded."

crawling towards me," his "big tail" "wagging." "Throwing away the big club, I fearlessly met him half-way and at once began stroking the great head, on which I had, such a short time before, rained such heavy blows. Jack was conquered." (My Dogs in the Northland, pp. 131-135.)

On one of his tours Dr. Young found himself when darkness fell, "at a place where the bold high banks rose up perpendicularly" from a solidly frozen lake. The only possibility for supper lay in building a fire on the ice from trees washed out of the bank above, and now buried in deep snow drifts. They succeeded however, in the undertaking, and hastened the work of the camp, knowing "full well that the instant the fire burnt down through its foundation of logs, the steam from the melting ice would extinguish it." Beds were prepared for a few hours' needed sleep and rest on the ice." Suddenly there appeared rushing into their midst "half a dozen wild looking Indians, accompanied by over a dozen of vicious, half-starved Huskie dogs," that "made a sudden fierce attack" upon the doctor's dogs and drove them away, and "at once set upon everything eatable." His men seized whips and firebrands and "vigorously assailed" them. Indeed, all night they fought with whips and clubs. "But it was all in vain. Those dogs," the missionary writes, "got our venison and buns and many other things. One of them ate several feet off the end of one of the heavy whiplashes, and another devoured or carried off the moccasins of one of the men." (My Dogs in the Northland, pp. 53-58.)

Again: Jack once broke through the ice in a thin spot, and "had a narrow escape." When at last after a twelve mile run to get to a place where there was wood, a fire was built, Jack, "still encased in ice," was placed on a buffalo robe beside it. "I had feared," writes his biographer, "that it would require not less than two of us to hold him near enough to the fire" for the thawing of the ice, as "most dogs have a very decided objection to being found so close, where there is any danger of their whiskers being singed." But Jack was no ordinary dog, and as soon as he understood that the "robe and fire had been designed for him," he began to move about on all fours as near the fire as possible without burning himself. Then to further facilitate matters he stood upon his hind feet, and like a "great dancing bear, he kept jumping around before the fierce fire, turning every part of himself to the bright warm flames," "until every bit of the ice was melted," and his glossy coat was dry. (My Dogs in the Northland, pp. 85-90.)

"Rover, like all of my civilized dogs, had not the hard, firm, compact feet of the Huskies." So for him and others dog shoes were made. The dogs were not long in finding "out the comfort there was in them," and "Rover soon became an adept in asking for his shoes. . . . It was interesting to see how he would wait until we were ready to harness up the dogs, then he would deliberately throw himself on his back, and, putting up his feet, eloquently, even if mutely, thus plead for his warm shoes. (My Dogs in the Northland, pp. 191-193.)

"Buck's feet were not so compact and hard as the feet of the Huskies. His had softened during the many generations since his first wild ancestor was tamed." "The-dog driver . . . sacrificed the tops of his own moccassins to make four moccasins for Buck. This was a great relief, and Buck caused even the weazened face of Perrault to twist itself into a grin one morning when François forgot the moccasins, and Buck lay on his back, his four feet waving appealingly in the air." (The Call of the Wild, p. 77.)

L. A. M. BOSWORTH.

EUREKA, KAN.

Buck "was beaten . . . but he was not broken; . . . a man with a club was . . . a master to be obeyed, though not necessarily conciliated. Of this last Buck was never guilty, though he did see beaten dogs that fawned upon the man, and wagged their tails and licked his hand." (The Call of the Wild, pp. 28, 31, 32.)

Two of Jack London's characters had a similar experience on the shore of a frozen lake. "At their backs rose a perpendicular wall of rock," and "they were compelled to make their fire and spread their sleeping robes on the ice of the lake itself. A few sticks of driftwood furnished them with a fire that thawed down through the ice (Hardly!); and left them to eat supper in the dark. . . . The camp was suddenly discovered to be alive with . . . starving huskies." "The two men sprang among them with stout clubs," but to no avail. The team dogs were "set upon by the fierce invaders," and "swept back against the cliff." "At daybreak . . . fully half their grub supply was gone," and "nothing, no matter how remotely eatable, had escaped them. They had eaten a pair of Perrault's moccasins . . . and even two feet of lash from the end of François' whip." (The Call of the Wild, pp. 68-73.)

The story that Jack London tells sounds quite tame beside this funny scene that made the witnesses, to "put it very mildly," "laugh until they cried." But here it is: "Once the sled broke through with Dave and Buck, and they were half frozen and all but drowned. . . . The usual fire was necessary to save them. They were coated solidly with ice, and the two men kept them on the run around the fire, sweating and thawing, so close that they were singed by the flames." (The Call of the Wild, p. 75.)

To the Editor of The Independent:

In reply to yours of January 16. By all means go ahead and publish that article that accuses me of plagiarism of many passages in "The Call of the Wild." So far as concerns the source of much of my material in "The Call of the Wild" being Egerton R. Young's "My Dogs in the Northland," I plead guilty. A couple of years ago, in the course of writing to Mr. Young, I mentioned the same fact, and thanked him for the use his book had been to me.

I wish, however, that you would get the writer of the said article to include in it a definition of what constitutes plagiarism.

Mr. Young's book, "My Dogs in the Northland," was a narrative of fact, giving many interesting true details of his experiences with dogs in the Northland. Fiction-writers have always considered actual experiences of life to be a lawful field for exploitation—in fact, every historical novel is a sample of fictional exploitation of published narratives of fact.

Take an instance from the article accusing me of plagiarism, now in your hands—that of the dog that lay down on

its back with its paws in the air and begged for moccasins. This happened to one of Mr. Young's dogs, and I exploited it in my story. But suppose that I am in the Klondike. Suppose this incident occurs with one of my dogs. I can utilize this material in a story, can I not? Agreed. Now suppose it doesn't happen with my dog, but with some one else's dog, but that I happen to see the incident. May I use it? Again agreed. Now, however, I do not see the incident, but the man with whose dog it occurred tells me about it. May I use it? Again agreed. A step further, instead of telling about it, a man writes the incident, not in a story, but in a plain narrative of incidents. May I use it in my story? And if not, why not?

Another instance. In the course of writing my "Sea-Wolf," I wanted to exploit a tumor and its ravages on the brain of a man. I asked my family physician for data. It happened that he was the author of a brochure upon tumors on the brain. He turned this brochure over to me. In it was everything all written out. I used the material. Was it plagiarism? His brochure was not fiction. It was a compilation of facts and real happenings, in a non-fiction form.

And so it was with Mr. Young's "My Dogs in the Northland." Really, to charge plagiarism in such a case is to misuse the English language. To be correct, "sources of materials used in 'The Call of the Wild'" should be substituted for "Plagiarism." JACK LONDON.

OAKLAND, CAL.

Beneath the Stript Arcade

BY HENRY AUSTIN

O SOFT October sunshine,
O weather fairy-fine,
As down the path we saunter,
Her elfin hand in mine,
Methinks a gay enchanter
Hath turned the air to wine!

Blithely she sings and prattles
As brook in sylvan shade;
Lithely she trips and prances
Beneath the stript arcade
In time to dead-leaf dances
Or tunes by zephyrs played.

The men who rake the red leaves
From off the bordering grass
Upon the hard grey gravel—
Which typifies, alas!
Their trodden lives of travail—
Smile, as they see her pass.

And pause from stooping labor
To watch the winsome sight,
While at my side she flutters—
No butterfly so bright—
And musically utters
Her delicate delight.

Anon upon the gravel
My shadow, slanting thrown,
Arrests her wandering vision
And in a frolic tone,
Elusively Elysian—
A voice charm all her own:—

"Papa!" she cries "Your shadow!
See, see, how I can run
Right over it and in it
And hide it from the sun!
See now! It looks this minute
As if there wasn't one."

Nay, more than my own shadow
Seems there at once to fade
Under the spell of lightness,
Wrought by that radiant maid:
From Human Life her brightness
Chases the haunting shade.

O soft October sunshine,
O weather crystal fine,
Methinks the air is turning
To eucharistal wine,
As now with deeper yearning
I clasp her hand in mine.

Ah! Daughter, by my shadow
Dancing along so bright,
Would I might keep thee ever
Thus in my erring sight
And so walk on forever
And ever by thy light!

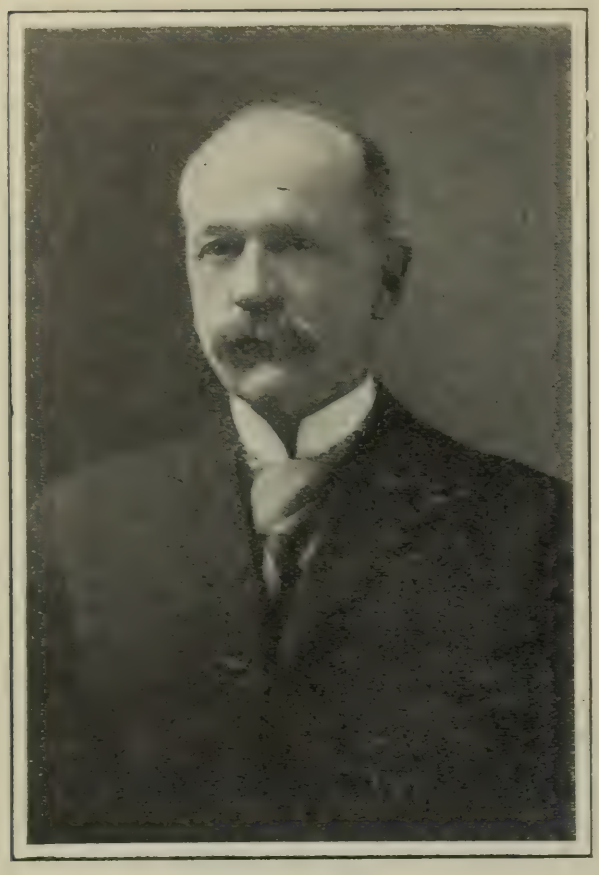
PASSAIC, N. J.

Men We Are Watching

BY A WASHINGTON JOURNALIST

The New Smithsonian Secretary

EXTRA glances from the watching world are falling on Dr. Chas. D. Walcott. He is a man who has been well watched for years—a dozen or more of which he has been at the head of the United States Geological Survey, and for time past the chairman of the Board of Trustees of the National University founded by Andrew Carnegie, and president of the Washington Academy of Sciences. He has been worth watching, not only because he is progressive but because he is truly great.



The extra glances have been caused by the action of the Board of Regents of the Smithsonian Institution electing him secretary, to fill the position left vacant by the death of the late Professor S. P. Langley. It is more than the frequently stilted encomium to say that a better selection could not have been made. He is a man fully up to the position—and few there be of whom this could be said. One instinctively congratulates the Smithsonian, having been led to fear—by reason of several fruitless efforts during the past year—that the regents would be forced to take some one of lesser ability. The salary is so low—not above $7,500 at most—that it has failed to tempt the great men who have been under consideration. It should be added of Dr. Walcott, and as one indication of his worth, that to accept the position he finally declined an offer of $20,000 a year which for some time past has been pressed on him.

Dr. Walcott impresses one as being physically as well as mentally a strong man—a man built for hard work, for which he has already proved his inclination and ability. He is so thoroly democratic, so consistently cordial and easy to approach, that one forgets, at first, that he is one of the greatest of scientists. His course of climbing has thrown him into the active world and his salaries and positions have kept him a part of the "social swim," leaving him little opportunity to enlarge upon the eccentricities of genius.

It is not often that scientific, social and executive talents are evident in the same man. It is most rare that the three are combined each in such remarkable degree. For Dr. Walcott is world-renowned as a geologist and paleontologist, while he has exceptional repute as an administrator in whose hands the Geological Survey has more than doubled the scope of its investigations. It has reached all over the country, covering all questions the answers to which underlie the development and best disposition of the nation's mineral resources. It would be difficult to estimate the value to the country of Dr. Walcott's services in the application of scientific and business principles combined, to the problems which have been solved by specialists in the department under his direction. He would have been an earlier choice of the regents but the President objected to his being removed from the head of the Geological Survey. And withal he is a delightfully cultivated and attractive gentleman.

His voice is not the pleasantest part of him, but his words atone for it. He speaks slowly, indicating an appreciation of the value of words. You know that he means all he says, and you forget an apparent lack of superficial energy in a deep trend of earnestness which most impresses you; just as in meeting him for the first time you see chiefly forehead—all forehead; high, broad and bulging, from which the light brown hair has beaten a wide retreat without gathering any silver, tho the man is fifty-six.

The rest of the face is that of a shrewd, successful business man—keen eyes, a straight nose and sturdy reddish brown mustache which successfully covers up the lips. The combination correctly portrays the character of the new Smithsonian secretary, and for that the institution is to be congratulated; for while it must have at its head a justly celebrated scientist, it stands sadly in need of such an able executive officer as Dr. Walcott has amply proven himself to be.

DR. CHARLES D. WALCOTT.

Dr. Walcott knows to what he is transferring his energies, for he acted as assistant secretary, in charge of the National Museum, in 1897 and 1898. He appreciates better than the world the gravity, importance and the distinction of the office. As a nation we are reprehensibly ignorant of one of our most valuable and effective institutions. Briefly put, the new secretary will be the ranking scientist of the realm. The office carries greater prestige and influence than the presidency of any university or scientific institution. The occupant is the nation's tutor and chief adviser in all scientific matters. He has the privileges of the floor of the Senate and the official title of a Cabinet officer, "Mr. Secretary." At State functions he is accorded precedence of brigadier generals. Neither President nor Congress have the power to remove him from office. It is a life position and he is principal executive officer of the Board of Regents, to which alone he is responsible. By virtue of his office the secretary of the Smithsonian Institution is also the administrative head of the National Museum, the Bureau of American Ethnology, the Bureau of International Exchanges, the Astro-physical Observatory and the National Zöological Park.

The New Secretary of the Treasury

There is curiosity as well as both encouragement and criticism in the eye the world has fixed on the Postmaster-General, because he is about to step over into the Treasury building. From some quarters there came strong opposition to the confirmation of the new Secretary, and many an old-timer sat up and rubbed his eyes and looked again and asked his neighbor in a rather sarcastic way what qualifications George B. Cortelyou had which fitted him for one of the most important positions in the Executive Department of the United States. I have heard at least a dozen Solons say, with something like a gasp, that Cortelyou was not a banker. Bah! The Secretary of War is not a general. The Secretary of the Navy is not an admiral. Every one admits now that Cortelyou has made one of the most efficient Postmasters-General the country ever had, but he was never a country postmaster.

Qualifications today for anything under heaven are ability, not experience. Talent is something. Tact is everything. The man who has executive genius can find people in plenty, in any field, to serve under him. When the President appointed Cortelyou Secretary of the new Department of Commerce and Labor, people at large thought the less of Commerce and Labor; but Cortelyou organized what almost immediately became the colossal and most directly effective arm of the Government. When the President made Cortelyou chairman of the National Republican Committee the old politicians protested violently that the position should be held by some one who knew something about political campaigns; but somehow or other the President received the prettiest election in history.

It has been the same story all along the line. A good part of it may be according to the old saw about a prophet in his own country, for Cortelyou's country has virtually been the whole country since more years ago than seem possible when we remember that he is yet lacking forty-three.

Since Grover Cleveland's days we have all known Cortelyou. We've known him as confidential stenographer, private secretary and secretary to three Presidents, and on up. But we've never gotten over thinking of him as a stenographer. He was a champion stenographer, by the way. And the real question of qualifications for Secretary of the Treasury begins back there. In all that we have known about Cortelyou have we ever known him to blunder over anything—since the time when he put system into the office of secretary to the President, making it what it is today, one of the most effective and influential position in this Government?

GEORGE B. CORTELYOU.

That is what counts, and what has counted with Cortelyou from the beginning of his career, and will count, so long as he is anything, no matter what. He never attempts to attend to details himself, but he has always had a genius for picking competent men and making them responsible. He is the hardest worker in the Cabinet, putting in the most hours and turning off a prodigious amount in every one of them, but he never appears to be busy. He is never in a hurry. He is an exceptionally handsome man and an exceptionally well-groomed man. Hurry would be decidedly unbecoming to him. He seldom smiles a right hearty smile. His face is not built for it. It is too earnest and thoughtful a face. But unless there is occasion for the other thing, there is always a genial touch of something which is almost a smile flitting over every feature. He is quiet, demurely dignified always. There's an imperturbable self-reliance about him which never yields to excitement. His black hair, bristling back from his forehead, which has made him such an easy mark for cartoonists, and his short, black mustache have gone gray rapidly, in the last few years, but that is the only sign of

the burdens he has been bearing. His words and motions are always deliberate. His voice is musically low and undemonstrative, but his eyes tell you that he fully understands what he is saying and that you would better understand.

He is so gentle about everything and so easily approachable that one often fails, at first, to appreciate the manner of man he is; but by degrees the powers for good and bad that have been brought in contact with him are finding him out, and it is whispered—a whisper that one who knows Cortelyou can easily believe—that the strength of the opposition which is constantly developing against him is the result of the discovery that he is not a man who can be used for dishonest purposes.

Of all the brainy and efficient men the President has drawn about him there is not one more honorable or better capable of performing the duties of any Cabinet position than George B. Cortelyou.

The Senate's Child Laborer

At last the brilliant and versatile, the accomplished and super-energetic Senator from Indiana has leaped into the blaze of a double-jetted, multi-candle-powered concentration of light. He has made leaps that way before and has many times been watched, but he has never made such a successful landing in the light as this promises to be if there is real, materializing truth in the proposed year-long battle of letters between the Republican David and the Democratic great man of Gath.

It is hardly to be expected that the silent partners will consent to the Philisto-Hebrew acquiescence in the outcome, and such a prolonged contest over issues so few and comparatively immaterial as may yet be foreseen, one would think might tend to multiply words without wisdom. However, the contest, while it wages, will serve several good purposes—it will be a liberal education to the contestants, it will add to the gayety of the sometimes somber arena, it will keep for some time in the bright light two men who are much happier there than when sitting in the shadows. If either of them rises, later, to longed-for hights, the stones of printer's ink which they have thrown too recklessly may be thrown back at them; but that is their lookout.

Just now Senator Beveridge is in the midst of his child-labor agitation, and however little hope there may be of effective national legislation on a subject pressing so close to the tender toe of State rights, no one can doubt that he

SENATOR A. J. BEVERIDGE.

is bravely attacking a brutal abuse of the most helpless of humanity; that he has taken a courageous stand against large aggregations of wealth all over the country, and that in his three days' speech he made out a case of fairly blood-chilling outrage which cannot fail to have an indirect effect for good, far and near.

Into his attack the Senator put almost cyclonic energy. But cyclonic energy is natural to him. He put the same thing into his Statehood speeches last session. He wags his head, shakes his fist, slaps his hand, bangs his desk and tests the capacity of his vocal organs in a way utterly to exhaust his listeners, if not himself.

But there's this to be said of Senator Beveridge which cannot be said of some

of his colleagues who are adepts at the present fad of muscular demonstration: There is method in his madness. His physical and mental pyrotechnics keep good time and tune. His fists follow his tongue, instead of trying to do the work for it. Nevertheless, they often do him injustice and weaken the effect. It is evident when, between whiles, Senator Beveridge often reaches hights of eloquence and thrilling rhetoric.

Nature has been extremely generous with him. Sometimes he seems to fail of full appreciation and reciprocation. Having formed my own opinions only as a casual acquaintance and onlooker, I asked an intimate friend of the Senator's what he thought of him. He replied:

"I believe in him. He is clean, intelligent, earnest, patriotic. I like him, but I'd rather sit on a red ant hill for an hour than spend the time alone in conversation with him."

At the Gridiron dinner, Saturday week, one of the apt bits was the statement that it was fortunate for the man behind the child labor bill that he got himself elected to the Senate before advocating his theory. Senator Beveridge is no baby, being well on to forty-five, but he has many characteristics hinting it. He has a superabundance of nerves and ill-controlled humanity. He is forever gliding restlessly about the Senate corridors, half the time at a hitching skip that is little short of a run. Then he pulls himself together, pulls down his cuffs and flies to the opposite extreme.

He is tall, rather thin, naturally graceful in motion and brilliant in thought. His narrow, sensitive face, with its broad, straight mouth and shock of brown hair, is better to see in repose. He is the Senate's "ladies' man" and criterion in the art of tailoring. Newspaper notices that he proposes to address the Senate fill the galleries with ladies. He breezed into the Senate one of the first hot days last summer clad in pearl gray from head to foot. There were gasps from some of the black-frocked, but the hot weather grew hotter, and by the end of the week gray was no longer conspicuous. Senator Beveridge has the courage of his convictions, whatever he undertakes.

When he first came to the Senate he showed qualities which attracted the fatherly interest of that monarch of political engineers, Orville H. Platt, of Connecticut. He took him under his wing, counseled and guided him, and those who did not know marveled at the strides which the new Senator made. Then Platt died and for a time Senator Beveridge floundered.

He has recently been gathering himself together again and his halo assumes its pristine luster. Some say it is the work of the President, who has certainly given him a front-row seat in the big White House tent. However that may be, Senator Beveridge certainly has ability, but if he has good advice behind him there is no reason why his ability at brilliant word-pictures should not win him new laurels.

WASHINGTON, D. C.

Race Prejudice

BY H. G. WELLS

[We are glad that Mr. Wells has turned aside for a time from the manufacture of utopias for the purpose of attacking one of the chief obstacles to progress toward any utopia, an obstacle none the less real because it is largely fictitious. In Race Prejudice he has a foeman worthy of his pen. THE INDEPENDENT has been fighting this dragon for over half a century and we welcome our new ally. Some comment on Mr. Wells's article will be found in our editorial department.—EDITOR.]

SUPPOSE it were given to a man that he might slay one dragon and one only in this world, and perish—in a world confused by dragons he would, I imagine, have a time of some perplexity. With this assurance of victory and finality he would decline, of course, to take on any dragon haphazard. A natural instinct would rebel at the idea of wasting himself on any little, up-country, village-devastating dragon that came along. He would, I suppose, conduct the most careful inquiries and find out the very biggest dragon in existence before he decided. And so he would achieve himself magnificently and live forever after on coins and banners and beer bottles, as dragon slayers do.

Unhappily, the old conditions of dragon slaying have passed away, and the old-fashioned square fight outside the city walls, with triumphant returns and a princess and so forth—the sort of thing Carpaccio did so delightfully—no longer obtains. The modern dragon is a vague, miasmatic beast that looks at you and vanishes, out of a book, out of a talk, out of the mind of a friend. He dies obstinately by inches, and you never know when he is quite dead. Moreover, he isn't killed by any single knight errant, but by all sorts of individual efforts, so that nobody—unless it's some impudent impostor who never touched the creature—ever gets much credit for the more or less partial slaughter. This has discouraged but by no means abolished knight errantry. Knight errantry is as much a part of a wholesome human being as falling in love or self-assertion, and therein lies one's hope for mankind. Nearly every one, I believe—I've detected the tendency in old cheats even and in disreputable people of all sorts—is ready to put in a little time and effort in dragon slaying now and then, and if any one wants a creditable dragon to write against, talk against, study against, subscribe against, work against, I am convinced they can find no better one—that is to say, no worse one—than Race Prejudice.

I am convinced myself that there is no more evil thing in this present world than Race Prejudice; none at all. I write deliberately—it is the worst single thing in life now. It justifies and holds together more baseness, cruelty and abomination than any other sort of error in the world. Thru its body runs the black blood of coarse lust, suspicion, jealousy and persecution and all the darkest poisons of the human soul. It is this much like the dragons of old, that it devours youth, spoils life, holds beautiful people in shame and servitude, and desolates wide regions. It is a monster begotten of natural instincts and intellectual confusion, to be fought against by all men of good intent, each in our dispersed modern manner doing his fragmentary, inestimable share.

Here, to hand, are two contributions to this assault, of very unequal pretension and quality, it is true, but each with a very valid claim upon the time and attention of the thoughtful reader. One is M. Jean Finot's *Race Prejudice*,[1] and the other Mr. Sidney Olivier's modest and most important *White Capital and Colored Labor*.[2] I will deal with the former first, because I like it least. It is a book with a certain weakness of method, with a lack of grip, of any strong consecutiveness in its reasoning, and with far too many unsuccessful attempts at that polite irony of treatment which seems to be the common French ideal for work of this sort. Moreover, the poverty of its English suggests indifferent translation, and there is a weak and flattering author's preface to this English edition (with complimentary allusions to the Anglo-Japanese alliance and the *Times*) that is anything but a beneficial addition. Moreover, there are whole chapters that have nothing to do with Race Prejudice at all, which discuss Weismannism and de Vries and some imaginary "school of Darwin" with a quite irritating feebleness. In spite of all these defects, the book remains a most interesting and useful contribution to the aggressive study of this great issue of racial injustice.

Its value lies entirely in its destructive accumulation of errors and nonsense from the literature of the subject. It studies Race Prejudice neither in actual life nor in its intimate psychology, but purely as an aspect of those great masses of pseudo-science, sham ethnology, dogmatic anthropology, of which the last fifteen years has been so productive. Particularly good is the brief opening sketch of Count Gobineau and Gobinism. Count Gobineau wrote in 1854 a ponderous essay in four volumes on the "Inequality of Human Races" that nobody read, and was, nevertheless, the real father of that great blonde "Overman" theory which still goes about the world, which is, for example, to be detected tangled in a sort of tentacular fashion 'round the ankle of Mr. Bernard Shaw. It is true that nobody read Gobineau, but he talked better than he wrote, and in Rome he met Richard Wagner and infected the composer's febrile philosophy with his own race mania. So Gobinism

[1] RACE PREJUDICE. *By Jean Finot.* Translation published by E. P. Dutton & Co., New York. $3.00.

[2] WHITE CAPITAL AND COLORED LABOR. *By Sydney Olivier, C.M.G.* Published by the London Independent Labor Party. One shilling.

got at us and today one needs a sort of intellectual respirator if one is not to breathe it. And M. Finot shines, too, in his patient massing of sample clots of nonsense about Kelts, Teutons, Aryans, from all the pretentious rubbish of the last two score years. His mockery of Renan's exposition of the poetic dreaminess of the Kelt is entirely adequate, and so, too, is his exposition of the more apelike characteristics of the Europeans and Japanese as contrasted with the negroes. He is at his fullest in his admirable account of the present population of France, considered as a specimen European population. He shows the profoundly mixed quality of its origins, the difficulty of tracing the origin of its types, and the enormous preponderance of the *milieu* and of culture over inherited origins in molding form and habit. Extremely good, too, is his collection of nonsensical contradictions about the psychologies of peoples. He devotes, however, far too little attention to the share of the Jews in sustaining and exasperating Race Prejudice in France and thruout Western Europe by their unhappy and ill-advised insistence upon their own. For my own part, it is when I am in contact with aggressive Jews that I find it hardest to keep a steady head in this matter of race, and not to succumb to the intense irritation of the racial self-assertion. The racial distinctness of the Jew is as illusionary as the racial distinctness of the Irishman. The Jews obviously vary thru a series of Mediterranean and African types, are essentially a culture of mixed blood and mixed quality, and not a pure race; nevertheless, a Disraeli-struck Hebrew talker, full of fantastic claims to intellectual, moral and physiological and esthetic superiorities, can, I suppose, rouse the evil passions of race jealousy against his people more effectively than any other kind of exponent of such unsubstantial and dangerous generalizations.

Before leaving M. Finot's book, it may be well to point out that he frames his main argument as an argument for human equality, as tho that equality were an objective fact, and not purely a convention of conduct and intercourse. He really seems at times to believe that much, and to assume a position as indefensible as the Gobinist doctrine of the ineffable superiority of blond dolichocephaly. Obviously in no measurable or estimable personal quality are men equal. Nor is it easily credible that, taken all 'round, one man is as good as another; there are always mysterious compensations. It is far more acceptable to suggest that some individuals are on the whole superior, others inferior to the average. The truth of the case lies in the fact that these superiorities and inferiorities are too various and subtle to admit of class and race treatment. The evil is in the false generalization that bars the treatment of the individual upon his merits. Equality is not an intrinsic fact, but a question of status. All men are equal—before God and under the law. In a really civilized community equality and a mutual respect must be the primary assumption of all social intercourse. But that must not blind one to the real differences of personal quality, to such a fact as that a negro is usually simpler, kinder and stupider than a Beacon street Bostonian. One has to keep one's head in these matters, to balance on differences without either intensifying or denying them—the most difficult exercise of all for the human mind.

It is one that Mr. Olivier has most admirably performed in his able and illuminating little book. It is the fourth of an excellent series of shilling volumes published by the Independent Labor party under the general editorship of Mr. Ramsay MacDonald, and an altogether sane exposition of the labor problem in relation to race. Mr. Olivier is known to the general public chiefly as an able colonial administrator; his literary and philosophical quality still awaits recognition. A few characteristic sketches and essays remain memorable to their readers, but this, I believe, is his first published volume. In its comprehensive grasp, its balanced tolerance, its reality and conviction of knowledge, it is perhaps as sharp and desirable a contrast to such a book as Mr. Kidd's "Control of the Tropics" as one could well imagine. Its subtle and powerful introduction is a quite remarkable piece of racial psychology, still more remarkable when one contrasts its unpretentious publication in a shilling volume by the Independent Labor party with the immense dignity of presentation customary

with books of this sort. It is part of the ludicrous commercialism of our time, and the grotesque reaction between publishers' advertisements and the literary column that the attention given to a book is very largely determined by its bulk and price, and I can only hope that in this instance the rare mental distinction of this little volume will save it from the common fate of shillingsworths.

The most noteworthy point perhaps, both in his book and in M. Finot's lesser and longer work, is the treatment of that bugbear in racial discussion, racial admixture. The United States are pervaded by a passionate hostility to interbreeding. Now Mr. Olivier deliberately advocates interbreeding, and M. Finot sweeps aside all the ugly superstitions that make the "half-breed" a threat and defilement to civilization. Indeed, the French writer has the audacity to hint that a certain proportion of black blood improves the white American strain, that some of the most beautiful and able women in America are to be found among the colored class. This would be an intensely interesting question to pursue. Certainly it would be difficult to find any purely white American woman more level-headed and capable than that admirable public speaker, Mrs. Church Terrell.

I do not propose to follow Mr. Olivier in his concise and complete survey of the black problem in America, in Africa and elsewhere. His is a book universally accessible, and one it is an absolute duty to read if one is not to henceforth hold one's peace upon racial questions. But here I would, nevertheless, copy out certain passages, because they cannot be too widely printed and read. Let it be noted that these are the words of no mere theorist about race, that the writer has gone with wife and daughters among these colored people.

"The manners, even of the town population, are gentler and more agreeable than those which one is accustomed to meet with in most places of European resort. And, generally, in this matter of courtesy, which is essential to the relation of equality, I should be prepared to maintain that the African is, by the temperament and customs of his race, not inferior but superior to the average Teuton, and I am forced to attribute the 'sauciness' complained of in the negro of the Southern States and elsewhere, far more to the attitude which has been taken and which is maintained toward him, than to any inherent fault in his composition.

"'We must protect our women'; that is the formula. It is true that the statistics of lynchings show that by far the greatest proportion of them follow cases of murder or complicity in murder, and only about 20 per cent. cases of criminal assault or attempts at such assault. This plea, therefore, really covers but a small part of the ground. But as it is the last entrenchment of those who advocate differentiation against the negro, and appeals to the same sentiment as does that argument for social injustice as an antidote to the menace of 'social equality' with which I have dealt above, it is important to examine it in the light of social experience in the British West Indian Colonies.

"Now, the fact is that in the British West Indies assaults by black or colored men on white women or children are practically unknown. No apprehension of them whatever troubles society. I say this as an administrator familiar with the judicial statistics, as a resident familiar with all parts of Jamaica and all classes of its population, as the head of a household of women and girls who have frequented the suburbs of Kingston, and lived for weeks and months in remote country districts with neither myself nor any other white man within call. Any resident in Jamaica will tell the same story. A young white woman can walk alone in the hills or to Kingston, in daylight or dark, thru populous settlements of exclusively black or colored folk, without encountering anything but friendly salutation from man or woman. Single ladies may hire a carriage and drive all over the island without trouble or molestation. Offenses against women and children come into the courts, but they are not against white women and children. Whatever may be the cause, it is the indisputable fact that Jamaica or any other West Indian island is as safe for white women to go about in, if not safer, than any European country with which I am acquainted. There have been no savage punishments here, no terrorism, no special laws, no illegal discriminations against the colored. If, then, there is special grounds for fearing assaults of this character by colored on white in America, it clearly cannot possibly be due to any necessary or special propensity of race."

And quite lucidly and clearly does Mr. Olivier trace the special evil of the Southern States to its true cause, to the passionate prejudice based on old injustice, of the whites, and with equal conviction he demonstrates his remedial methods, methods entirely harmonious, I am glad to see, with Dr. Russell Wallace's admirable suggestions in a recent *Independent Review*. Essentially they amount to giving the colored man a share in legislature and judicature under special conditions. But read the book.

London, England.

Literature

The Adventurous Romance

Most of the latter-day stories of adventure can be assigned with ease to one of two classes—the mildly impossible and the wildly impossible. To judge from the recent output, the second of these classes is somewhat in danger of becoming overcrowded. It may be true that the appetite for sensational fiction grows with what it feeds upon, but authors and publishers must remember that they are catering not only to the seasoned veterans who revel in tales of dark mystery and sudden death, but also to the generality of novel readers, who, fortunately, have a rather more catholic taste, and who, when they take up a romance of daring deeds, are not overjoyed to find it modeled after Baron Munchausen. It is a pity, for example, that so excellent a spinner of yarns as H. B. Marriott Watson could not have brought his latest story, *The Privateers*,[1] somewhere within hailing distance of the limits of credibility. The situation about which he constructs his narrative is absolutely ridiculous, and, as it has not been his design to write a funny book, his efforts pall before very long. Two American speculators see in the possession of an English girl the key to fortune; the one first on the scene proposes and is accepted, but his resourceful rival, not to be outdone, kidnaps the prize and sails away to France, whither he is hotly pursued by the disappointed bridegroom-elect and an English naval officer, who soon proves to be the hero of the piece. The young woman is immured in a château, her rescue by the gallant Briton being but the beginning of a series of hair-raising episodes, each of them a bit more startling and bearing more definitely the dime-novel stamp than the one immediately preceding it. Over land and sea the quartet go at breakneck speed, fortune usually favoring the villainous actors in the drama. It is fast and furious melodrama written for the special delight of the gallery gods.

A story, the incidents in which, if not more reasonable, are more ingeniously contrived and handled, is *Doubloons*,[2] by Eden Phillpotts and Arnold Bennett. Mr. Phillpotts certainly goes far afield from Dartmoor in this tale of murder and West Indian treasure. The murder is in London, and the first part of the narrative furnishes detective fiction of an absorbingly interesting sort. However, after the mystery is cleared up, there is nothing of particular consequence to take its place, and, as the good, bad and indifferent people of the story voyage from England to the West, the mechanism employed by the authors becomes distressingly apparent. Certain characters quite strongly delineated at the outset fade into commonplaceness before the last chapter is reached.

Robert Barr's *A Rock in the Baltic*[3] reads as if it had been written against time. The "rock" is used as a prison by those supposed monsters of iniquity, the Russian Grand Dukes, and there, in process of time, two enthusiastic seekers for trouble, one a young Englishman and the other a titled Russian, are incarcerated. Finally they are taken away on a yacht, on which two American girls are conveniently placed.

The sea has its part to play in all these stories, and no exception to the general rule is afforded by Benjamin Brace's novel, *The Seventh Person*.[4] The central figure here is an American collegian, on whom a number of very trying tasks are imposed by a most mysterious secret society. Obeying its imperative mandate, against which parental wishes count for naught, he departs for South America, where in a marvelously short time he wins great renown, a love affair with a beautiful señorita developing meanwhile. The scenes of his subsequent adventures are in Mexico and the South and West of this country. The conclusion is carefully manipulated.

The amazing experiences of a stranger in San Francisco are narrated with a

[1] The Privateers. *By H. B. Marriott Watson.* New York: Doubleday, Page & Co. $1.50.

[2] Doubloons. *By Eden Phillpotts and Arnold Bennett.* New York: McClure, Phillips & Co. $1.50.

[3] A Rock in the Baltic. *By Robert Barr.* New York: The Authors' and Newspapers' Association. 50 cents.

[4] The Seventh Person. *By Benjamin Brace.* New York: Dodd, Mead & Co. $1.50.

good deal of spirit by Earle Ashley Walcott in his novel, *Blindfolded.*[5] Things are tremendously involved from the very first, and the persevering reader who keeps his head clear thruout the succession of tangles is to be congratulated on his mental powers. The San Francisco described by Mr. Walcott ought to satisfy anybody with a desire for the unusual.

To come to the mildly impossible, K. and Hesketh Prichard offer much that is readable in their book of stories chronicling the further adventures of that prince of highwaymen, Don Q. The narratives making up the volume, *Don Q. in the Sierra,*[6] are crowded with exciting incident and are capitally told. The reappearance of Don Q. in his beloved Spain is managed with a fine eye to effect, and none of the succeeding exploits will be willingly missed. The final betrayal of the notorious brigand is a rather humiliating end to such a career, and the suggestion of Don Q.'s transformation into a monk is surprising, to say the least.

The humorous touches in Elizabeth Duer's gay little romance, *The Prince Goes Fishing,*[7] are very entertaining. The story, one of "yesterday," has a familiar background in the mythical European kingdom. There is a prince who has the not unnatural wish to study the princess selected as his bride; as to the Princess Hélène, she fills well the part of an adorable heroine. What befalls this royal pair is sufficiently diverting, and the life at the toy court of Palatina is also amusingly described. The novel will while away a leisure hour or so very pleasantly.

The reader of Burton E. Stevenson's *Affairs of State*[8] is also spirited to Europe. This tale of intrigue opens in a mirth-provoking way with an account of the enlivening influence of an American family on a Dutch watering place. Matters of large importance are destined to be settled at Weet-sur-Mer, and Mr. Stevenson develops his theme with the sure touch that may be expected of him. Of course, the Americans have a large part in what transpires. It is easy reading, and the events are such as to hold the attention.

It is evident that Fred M. White, author of *The Corner House,*[9] believes that members of the fair sex, when they put their minds to it, make criminals of the most pronounced type. The woman, who is the leading figure of Mr. White's new mystery story, is a most unpleasant person despite her good looks, and she manages, first and last, to bring much misery to a number of people. The author is a stickler for justice, and very properly has her machinations foiled, after the required amount of trouble results from them. Mr. White does not reach in this novel the high water mark of previous books.

[5] BLINDFOLDED. *By Earle Ashley Walcott.* Indianapolis: The Bobbs-Merrill Co. $1.50.

A Defense of the Deluge

FOR the past thirty years Professor Wright has devoted much of his time to investigations connected with the harmony of science and revelation, particularly along geological lines. He has discussed every phase of surfacial geology in his writings, having visited all parts of North America, Europe and Northern Asia, for the purpose of investigating glacial phenomena, so that from observation he is well qualified to judge of the questions involved in the scriptural statements of what have been esteemed miraculous occurrences. In his new book, *Scientific Confirmations of Old Testament History,** the topic chiefly calling for notice is the Noachian Deluge, which is usually regarded as incapable of successful defense. The author attempts to put it in the geological sequence.

An explanation of this cataclysm is given by Edward Suess, an Austrian geologist of world-wide fame, in his comprehensive treatise, "Das Antlitz der Erde," which does not seem to have attracted the attention of Professor Wright. After a full discussion of both the accounts, Suess concludes, first, the event known as the Deluge took place in the lower Euphrates and consisted prin-

[9] THE CORNER HOUSE. *By Fred M. White.* New York: R. F. Fenno & Co. $1.50.

* SCIENTIFIC CONFIRMATIONS OF OLD TESTAMENT HISTORY. *By G. Frederick Wright.* Oberlin, Ohio: Bibliotheca Sacra Company. $2.00.

cipally in an inundation from the sea, very broad and destructive; second, the essential cause of this catastrophe was a violent earthquake, which originated in the Persian Gulf, and had been preceded by several minor shocks; third, it is very probable that during the time of the most violent shocks a cyclone came from the south and spread over the region; fourth, the traditions of other nations do not authorize in any manner the extension of the deluge beyond the limits of the Euphrates basin, and still less to affirm that it extended over the whole earth.

It is the memory of this event, preserved for thousands of years in our literature, that has given rise to the geological expressions of diluvum and diluvial deposits.

The following propositions may express Professor Wright's views:

1. In most countries there have been extensive inundations in the early Quaternary period, which were caused partly by submergence of the land and partly from the superabundance of the water derived from the melting of the ice sheets. These are sufficiently widespread as to be labeled "universal."

2. Coincident with these floods there was an extermination of the early large mammalia, like the mammoth, the cave bear, the giant beaver and enormous carnivora.

3. Coincident with the extinction of the mammalia was the disappearance of races of men. Speaking geologically, it was the epoch separating the later from the earlier paleolithic ages. The coincidence of the life changes and the floods constitutes what is a real cataclysm.

4. The date of this cataclysm may not be far from 5000 B. C., assuming that it may be fixed by the length of time required for the recession of Niagara and St. Anthony's falls. Its recency seems to be substantiated by the discovery of the carcasses of several Siberian mammoths so well preserved that they are still capable of being used for food.

Of these various glacial floods there can be no doubt, but it is futile to try to connect them, even if only 5000 B. C., with the Noachian Flood, which is described as having occurred well inside of 3000 B. C.

Facts and Fancies of the Railway Problem

THE importance of the railway problem in this country can hardly be overestimated, if our judgment were alone based on the large amount of literature dealing with the question that has appeared within the last few years. New abuses of railroad power are constantly being exposed in print, and economists, pseudo-economists, politicians and practical business men have not failed to propose new remedies. The facts of the problem have been comprehensively stated in the reports of the Industrial Commission. Statistical data is readily obtainable from Poor's manuals as well as from the annual reports of the Interstate Commerce Commission. President Hadley several years ago issued a masterly little treatise on railway rates and railway management which few since have surpassed. More recently Prof. Balthasar Meyer, of Wisconsin, analyzed in a small book the laws and judicial decisions which govern railroads in the United States, and Prof. Hugo R. Meyer, of Chicago, has by a similar method pointed out the shortcomings of government regulation and control. Practical railroad men, such as H. T. Newcomb and the late President Spencer, of the Southern Railway, in public addresses, in periodicals, in booklets, etc., have presented the question of regulation and control from the point of view of the railroads. But, as far as bulk and comprehensiveness are concerned, all previous contributions are outdone by the latest work of Prof. Frank Parsons*, the prolific writer of the Equity Series. The greatest obstacle in reading books of the kind that Professor Parsons has produced is the shortness of human life. It is even admitted in the preface that, had the author yielded to the temptation to tell "all the strong facts at his command," each chapter of the book would be expanded into a volume, and the reader would be required "to spend the rest of his life to find out the relations between the railroads and the people."

Professor Parsons devotes the first part of his first book to what he calls the "vital facts" of the railroad history of

* THE RAILWAYS, THE TRUSTS AND THE PEOPLE. *By Prof. Frank Parsons.* Edited and published by C. F. Taylor. Equity Series. Philadelphia.

the United States. From these pages the reader is led to believe that all the evils of modern industry and politics in this country are due to the railroads. Trusts, commercial panics, political graft and bribery, extortion, strikes, and a thousand other crimes and evils have their roots in the railroad problem. The contention that the railroad rates in this country are excessive and extortionate is based largely upon their comparison with the rates prevailing in European countries. But Professor Parsons admits that such comparisons are apt to be misleading. He likewise treads on dangerous ground when he endeavors to prove the overcapitalization of American railroads from the estimates of the average cost per mile of roadbed. An estimate of the average cost per mile of all the railroads in this country is as meaningless as an estimate of the average wages prevailing among all classes of employees in a large industry. A few miles of the Pennsylvania Railroad may represent as large an expenditure as hundreds of miles of single track stretching across the prairies of the Mississippi Valley, which may "be best described as two streaks of rust on a mud bank."

The remedy for all evils of the railways, in Professor Parsons's opinion, is public ownership and control. He tells us that the supreme test of efficient railroad management is public welfare and not economic welfare. As applied to the community as a whole, however, this is a distinction without a difference. Undoubtedly there are many advantages of public ownership and operation, and the experience of other countries well illustrates this; but that there are also disadvantages, especially when American political conditions are taken into account, should be duly recognized. These disadvantages cannot become manifest until government ownership on a comprehensive scale is given a fair trial, and then it may remain to be seen whether the new evils that crop out under a system of direct government control will or will not overbalance the advantages. Despite the many facts and figures presented by Professor Parsons, there is still wanting a comprehensive and scientific study of the railroad problem.

A King's Divinity. By Dolores Bacon. (New York: Henry Holt & Co. $1.50.)

The time was when novelists never ventured to take democratic liberties with any royal personage who happened to get in the tale. A king was there to sit on his throne, and either to persecute the other characters or to magnify them with his august favor. But whatever he did was done with pomp and circumstance. Now all is changed. The popular mind demands it, and so kings are introduced in fiction that they may be taught, first, to play tag with the common people; second, and invariably, that they may return to them and make their bed among them. It is a very significant change in the fashion of the modern mind and bodes no good to kings in reality. This story shows how the course of true love does not run smoothly between a royal duke and a Yankee girl, but the deviations are described with so much humor and with so little awe of royalty in general that the book makes delightful reading.

Christian Origins. By Otto Pfleiderer. Translated from the German by Daniel A. Huebsch. New York: B. W. Huebsch. $1.75.

Primitive Christianity: Its Writings and Teachings in Their Historical Connections. By Otto Pfleiderer. Translated by W. Montgomery, B.D. Vol. 1. New York: G. P. Putnam's Sons. $3.00.

Professor Pfleiderer has been a specialist in New Testament studies and in the philosophy of religion for over forty years, and for over half that time his name has been familiar in England and America thru his Hibbert Lectures on the influence of Paul and other works in English. He delivered also the Gifford Lectures in 1894 and was one of the German delegates to the Congress of Arts and Sciences at St. Louis. His *Christian Origins* is semi-popular, being made up of sixteen lectures delivered before students of all faculties at Berlin two winters ago, something after the manner of Harnack's lectures on the essence of Christianity. They are a clear, concise statement of the author's views of the history of early Christianity, the preparation for it in

later Judaism and in Greek philosophy, the personality and teaching of Jesus, the modification of that teaching by Paul and others whose writings we have in the New Testament, and the final establishment of authority in the Catholic Church. So much ground is covered that the reasons for opinions have been largely omitted. The value of the work is especially in the references to facts and tendencies in other religions than Christianity as illustrating features in the growth of the Christian faith and partly contributing to this growth. Pfleiderer makes more use of comparative religion than do most Germans whose writings reach American readers. More thoro and technical is the same author's *Urchristentum,* the first part of which is now translated under the title *Primitive Christianity.* The German work has been recognized as one of the most valuable recent contributions to the understanding of the religion of the New Testament. The part now translated is concerned almost entirely with Paul.

The Day's Journey. By Netta Syrett. (Chicago: A. C. McClurg & Co. $1.25.)

How much trouble does it pay a woman to put into the task of keeping her husband in love with her? Perhaps that is a rather bald statement of the problem set by the author of *The Day's Journey,* but it is just. "If we want to keep them we must work hard!" cries the heroine, and many feminine voices echo the sentiment. "Men expect to be amused," and if they are not, and their wives get "ill and ugly," their defection is condoned. Lady Wilmot, an entertaining female Mephistopheles, remarks: "I've no patience with a woman who loses her looks—it's so careless!" And because poor Cecily has lost hers, while an old schoolmate has not, and knows how to flatter; and because a man comes to take his wife's devotion for granted, like the breath of the sweet-brier planted under his window, and begins to long for some more exotic and bewildering fragrance, Philippa Burton takes the center of the stage, and of a man's heart, where sits the ugly, squat god of Vanity, to which she burns incense of fragrant flattery. An esthetic young woman, "living the simple life," in a studio scantily furnished with a few pieces of high-principled furniture, sketches pinned awry, an easel and her wonderful self; a self always right, always self-justified, no matter what she did, Philippa's powers of plausible sophistry and snakelike evasion of clear-headed thought, are little less than miraculous. And we cannot help believing that there are many like her, villains self-deceived and quite capable of persuading themselves and incidentally convincing other people of the esoteric righteousness of their blackest deeds. To our mind the recreant husband was not worth fighting for; but that is not right-minded in us; any man's soul is worth a stout fight, and if he won't do it for himself, the best wife is she who will do it for him. If the soul in question only had seemed a little bigger, a little more noble, we might watch the conflict with more enthusiasm. He isn't much of a man—and his rival is worth ten of him, yet the heroine is right in bravely battling for the *ideal* of a married life, at least, and courage is a good asset, as well as fidelity, tho romance and earlier dreams of perfect happiness fail. The story is brilliantly told, and is a study of "temperaments," artistic and otherwise, of an unusually readable sort.

Reminiscences of My Childhood and Youth. By George Brandes. New York: Duffield & Co. $2.50.

To one who reads these reminiscences with the expectation of tracing the author's intellectual development they will prove a disappointment. In recalling his youth Herr Brandes has evidently allowed himself to be seduced by the romance which invests even the dreariest past. As a result, his narrative contains a good deal that may seem to the general reader trivial, even frivolous. But then the same objection might be made to Goethe's "Wahrheit und Dichtung." And, after all, it is by no means certain that such a procedure does not promote a knowledge of the writer's character, if not of his mental evolution. Certainly, as a revelation of his general consciousness, some of the earlier chapters are re-

markably vivid and telling. Of the friend of Taine, the representative of European rationalism, the opponent of Danish obscurantism, it may be that the reader realizes little; but on the other hand he realizes a good deal of the student groping his way among the débris of the past and the lumber of the present —of his doubts, perplexities and enthusiasms; his friendships and enmities, even his love affairs. And the latter view is, if anything, the more human and sympathetic, perhaps the more significant. We may be yielding to a temptation to allegorize; but the story he tells of the young girl whom he allowed to wheedle him into mischief and then to tie him up perfidiously like a boyish Samson while she thrashed him with her own hands seems to us, with his comment upon the incident, to be worth a dozen psychological anatomizations, so broadly suggestive is it of his temper and attitude: "This was my first real experience of feminine nature." Unhappily, however, the translation is not first rate, particularly in the Englishing of original turns and phrases, nor is the volume lacking in typographical errors.

Literary Notes

....A sprightly, pietistic manual on prayer-meetings is the Rev. James F. Cowan's "New Life in the Old Prayer-Meeting." (New York: Fleming H. Revell Co. $1.00.)

....The Rev. F. B. Meyer, whose qualities as a writer of religious books are widely known, is the author of "The Creed of Creeds," a series of brief, devotional expositions of the Apostles' Creed. (New York: Fleming H. Revell Co. $1.00.)

....A reverent and thoughtful discussion of the Gospel miracles in the light of modern criticism, by one who is a sincere believer both in criticism and in the Gospel, is had in the Rev. Richard W. Seaver's "To Christ Through Criticism." (New York: Imported by Charles Scribner's Sons.)

....The latest volume by the Rev. W. R. Inge, the Cambridge scholar, consists of six lectures delivered to undergraduates with the design of constructing a basis for intelligent Christian faith. The title is "Truth and Falsehood in Religion." (New York: E. P. Dutton & Co.)

....The two Shaw plays that are of especial interest to Americans just now, "Captain Brassbound's Conversion," which Ellen Terry is playing in New York, and "Cæsar and Cleopatra," in which Forbes Robertson is starring the country, are both contained in the volume of *Three Plays for Puritans,* published by Brentano's ($1.25).

.... A very good popular presentation of the results of modern study of the Bible is the Rev. W. C. Selleck's "New Appreciation of the Bible." (University of Chicago Press. $1.50.) What Biblical criticism means and how the Bible may be used and studied in the light of recent opinion as to its origin is told clearly and interestingly.

....The Noble lectures at Harvard for 1906, by President Charles Cuthbert Hall, of the Union Theological Seminary, on the subject of the attitude of Jesus Christ toward foreign races and religions, appear under the title "Christ and the Human Race." (Boston: Houghton, Mifflin & Co. $1.25.)

....In "The Missionary and His Critics," the Rev. James L. Barton, of the American Board, has assembled a large number of testimonies favorable to missions and missionaries from witnesses of competence and character. These testimonies relate to all the principal topics on which missionaries are usually criticised. (New York: Fleming H. Revell Co. $1.00.)

...."Outlines for the Study of Biblical History and Literature," by Professors Sanders and Fowler (New York: Scribner's. $1.25), will be found valuable for its references under each topic and sub-division to the best recent books on Biblical history and literature. A bibliography on any topic of Biblical study, sufficient for ordinary needs, could be made from this volume.

....The latest number of *Ridgway's* magazine, which is unfortunately also the last, contains a very frank and manly editorial explaining the causes of the failure of the venture. The chief cause was the dependence on newsstand circulation. A weekly magazine, they discovered, as we did long ago, cannot rely upon casual purchasers, but must secure a circle of subscribers who become its fast friends. That is why we have cut the price of THE INDEPENDENT from $5.20 for casuals to $2.00 for subscribers. No other magazine makes so great a reduction to its permanent patrons.

....Gerald Stanley Lee, of the *Mount Tom Magazine,* is a man gifted with a vision. He sees that the need of the day is that man shall master the machines he has made, not merely to use them, but to realize what they mean, to see that they contain as much poetry and religion as the hills and waves. He finds in the modern machinery the ideas of the incarnation, of liberty, of immortality, of the spirit and of love, and interprets them in a forthcoming volume entitled *The Voice of the Machine,* which is made up of rhapsody and epigram. Some passages go a step beyond the sublime and some of the epigrams miss fire, but it is so encouraging to find a man who can recognize contemporaneous poetry that we are not inclined to be critical. [Mount Tom Press, Northampton, Mass., $1.25.]

Editorials

Union Pacific Finance

THE Interstate Commerce Commission's investigation of the financial operations of the Harriman railway system will be resumed in New York on the 25th, when further inquiry will be made as to several transactions, a brief official record of which the Commission obtained in the first week of January. Among these transactions was the purchase by the Union Pacific, since June 30, of railway shares having a par value of $103,168,745, for which about $120,000,000 was paid.

By far the most interesting of these investments was that by which the Union Pacific became the owner of 281,231 shares of Illinois Central stock, paying $175 a share, or nearly $50,000,000 in all. Five-eighths of this stock was sold to the company by three of its directors—Mr. Harriman (the president), Mr. H. H. Rogers and Mr. James Stillman. The remainder was bought from a prominent banking firm (Kuhn, Loeb & Co.), two members of which had been Union Pacific directors in the preceding year, but had withdrawn from the board.

It is shown by the official record that at the board meeting of July 19th, Mr. Harriman explained why, in his judgment, the Union Pacific should buy Illinois Central stock; that a committee was appointed to consider the matter, and that this committee reported on July 31 in favor of the suggested purchase, saying it had procured an option at $175, upon the following holdings: Mr. Harriman, 30,000 shares; Mr. Rogers, 30,000 shares; Mr. Stillman, 30,000; Kuhn, Loeb & Co., 105,000. These shares were purchased, and with them (from Mr. Harriman), an additional number, apparently 86,231 shares, which had been in the possession of a holding company which Mr. Harriman controlled. As we have said, the transaction involved nearly $50,000,000. At the meetings of the board in which action was taken, the three directors who were selling the stock were excused from voting.

Inspection of the Stock Exchange reports shows that the market price was $175 at the close on July 19. There was a slight advance before the end of the month. At the end of last week the price was $158. The sales had been of small numbers of shares. The stock sold to the Union Pacific had not recently been bought in the open market. Indeed, a large part of it had been tied up in a holding company for a long time. The curiosity of those who would like to know how much the sellers' profit was, if anything, will probably be satisfied when the sellers testify before the Commission. It may be that their profit was merely nominal, covering nothing more than fair interest charges. They must admit, however, that testimony on this point is needed, for a prominent and conservative newspaper of New York published the following on January 8th:

> "Upon the highest authority it was ascertained yesterday that much of the stock which was turned over to the Union Pacific at $175 a share was acquired by members of the informal syndicate at very much lower figures, so as to average not over $135 a share."

Purchases of Illinois Central could not have been made in the Exchange market at less than $164 in 1906, or at less than $152 in 1905. If it be true that the stock in question was acquired at an average of $135, it must have been purchased more than two years ago. We do not assume that the newspaper which made the statement quoted above was correctly informed. Probably it was misled. We do not believe that these gentlemen sold the stock to the company of which three of them were directors (one being also its President) at a profit exceeding $11,000,000. We should not be surprised to learn that their profit was only enough to cover reasonable expenses.

But they should explain fully this transaction, showing what their gain was, if anything. This explanation they owe to themselves, to their associates in the board, to the company's shareholders, and to the public. Doubtless it will be made by them when the investigation is resumed, but it might well have been given to the public a month ago, in reply

to the current assertions that their gain by reason of these sales had been millions.

At the coming inquiry, the Commission will seek information not only about this purchase of nearly $50,000,000 worth of stock, but also concerning all the other purchases included in a total which probably exceeded $120,000,000. It should ascertain from what sources all these other shares were obtained, what prices were paid, and whether officers or directors were interested as sellers as well as buyers.

The propriety of such an investigation is manifest, and we presume that all the facts will be given cheerfully by Mr. Harriman and his associates. Great responsibility accompanies such extraordinary power as the Union Pacific board has granted to Mr. Harriman, and he should welcome an opportunity to show that this power has been properly exercised. As the testimony stands now, it leads many to think that the conditions were highly favorable for the making of "swollen fortunes" by sharp practice and an abuse of trust, and to believe that some could not resist the temptation which these conditions offered. We shall be glad to hear additional testimony that will remove such impressions from the public mind.

Thirty-two Millions

In a single gift Mr. John D. Rockefeller has added thirty-two millions to the eleven millions he had previously given to the General Education Board for the purpose of education. The sum is three times as much as has ever before been given at one time to any benevolent purpose, for ten millions was the extent of the largest single gifts of Mr. Carnegie and Cecil Rhodes.

The General Education Board was organized February 27, 1902, and grew out of a committee on benevolence which Mr. Rockefeller had previously asked to help him in distributing his gifts to education. To it he then gave a million dollars, and set it at work investigating the state of public education in the South. It found a low condition of public schools, and the people mostly poor agriculturists, ignorant of those better methods of agriculture which might enrich them so that they could afford to support better schools. The Board in various ways attempted to develop a public appreciation of the importance of education. It found in Texas, under the National Government, an example of a farm intended to demonstrate the better and more profitable methods of agriculture, and such "demonstration farms" it created in Alabama and Mississippi. The Board further found a great lack of high schools in the South, and it made appropriations in several State universities for "professorships of Secondary Education," the incumbents of which should encourage public sentiment to establish high schools. Such chairs were established in Virginia, North Carolina, South Carolina, Georgia, Alabama and Tennessee; and last year over two hundred high schools were opened, and $416,000 was given to Southern schools, half for colored schools.

On June 30th, 1905, Mr. Rockefeller gave ten millions more to the General Education Board, "to promote a comprehensive system of higher education"; that is, in colleges and universities. The principle adopted was thus exprest:

> "To co-operate sympathetically and helpfully with the religious denominations; to choose the centers of wealth and population as the prominent pivots of an educational system; to mass the funds or endowments, securing in this task the largest possible local co-operation."

From this fund there has been conditionally appropriated the sum of $1,077,500, and when the conditions are fulfilled there will be added $4,340,000 to the endowment of colleges in Pennsylvania, Ohio, Indiana, Iowa, Kansas, Wisconsin, Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Missouri and Tennessee.

The new gift, as we understand it, puts $42,000,000 in the hands of the Board, the income of which will be applied to the endowment of colleges which have a more or less definite relation to religious denominations. Nothing will go to a theological seminary. Usually, we presume, the trustees will be expected to match the gift with a substantial amount given by friends.

There are in the United States somewhat over 500 colleges. Of these 55 were organized by the States, less than 50 by individuals and other agencies, and over 400 by the religious denominations. The States are responsible for

their own colleges and will be generous to them. With the others there is some duplication and interference, and it will be the business of the Board so to apportion its gifts as to help those that are most worthy in the struggle for existence. These local colleges are greatly needed. They attract youth who would not otherwise seek an education.

There is a tremendous responsibility on this General Education Board. Its chairman is Robert G. Ogden; its treasurer, George F. Peabody; its two secretaries, the Rev. Wallace Buttrick and Starr J. Murphy, Esq.; and among other members of the Board are President Gilman, Morris K. Jesup, W. H. Page, J. D. Rockefeller, Jr., Albert Shaw, H. H. Hanna, Chancellor Andrews, President Alderman, Prof. H. P. Judson and Principal Frissell. They are wise men, and will do what they can for higher education for all races in the United States. We understand that no gifts will go out of the United States.

Does some one ask us to look this gift horse in the mouth, or to question whether the money is "tainted"? We refuse to do it. It is absurd to think that these gifts to education, planned for and inaugurated many years ago, were meant to influence the teaching of those who receive them. When the question of the givers of gifts was up some time ago we were clear that it was a squeamish righteousness overmuch, however earnest the intent, which forgot that "the altar sanctifieth the gift." We rejoice that the chief pleasure which such multimillionaires as Mr. Carnegie and Mr. Rockefeller find is in the distribution of their wealth where it will do good. At other times and at other places it is proper to call rich men to account for the way in which their wealth was gained.

As to Race Prejudice

On other pages Mr. H. G. Wells discusses Race Prejudice and calls attention to one French and one English work on the subject. His own conclusions are positively with their writers and he condemns the position of those who defend it, resting on ancient and baseless arguments.

We had thought we had detected a shade of this prejudice in Mr. Wells himself when we read his "The Future in America," just published, in which he gives his photographic observation during a brief visit to this country, and in which he admits himself afraid of the effects of the influx of Italians and other races from Central Europe upon the American character, as if their race characteristics were permanent and inferior. But in the present article he is even charitably disposed to that "interbreeding" which Mr. Olivier approves, and he tells us that "M. Finot sweeps aside all the ugly superstitions that make the 'half-breed' a threat and defilement to civilization."

Mr. Wells tells us that "the United States are pervaded by a passionate hostility to interbreeding" of races. On that matter we do not agree with him. There is no hostility to interbreeding between Caucasians and the Indians. Marriages are allowed everywhere, and are numerous in the Indian Territory. They have never been objected to since Pocahontas. Interbreeding between Caucasians and negroes is proven on every hand. Dr. Booker T. Washington, of whom Mr. Wells has nearly as much to say as of President Roosevelt, is an example of it. It is only intermarriage that provokes "passionate hostility." Probably half of the so-called negroes are interbred.

For intermarriage of races we hold no brief. We are neither for it nor against it. We only hold that interbreeding without marriage is vastly worse than interbreeding within marriage. A certain American of distinction was ethically right when to the question, "Would you have your son marry a nigger?" he replied, "Yes, if he had a child by her." But marriage, or intermarriage, is purely a matter of taste between the parties concerned, with which no law should intermeddle. Oklahoma is reported to have put in her proposed constitution a provision limiting interracial marriage, and that is reason enough why Congress should refuse to admit it with such a restriction in its organic law.

The essence of caste is in the law forbidding intermarriage. A leading journal in Calcutta tells the members of the Congress of Hindus looking toward more self government, that if they want re-

forms they should look first to their own degrading social rules, such as those which forbid the marriage of child-widows, and particularly the cruel tyranny of caste. It particularizes thus:

"As a matter of fact, nothing can break caste except intermarriage. Mere eating, or mixing in other ways, or going abroad, or even a change of religion cannot possibly affect caste. Nothing, in fact, can really destroy it except marriage with one of a different caste."

The one thing that most keeps the Jews as a separate caste as well as religion is that they discountenance intermarriage. In so far as they intermarry they break down this caste division and this race prejudice.

Of course we have in this country the race prejudice and the spirit of caste sadly accentuated because the negroes were slaves to the whites. But that will gradually be softened. We do not mean that there will be free intermarriage, because the blonde and the black are not mutually attracted. So far as intermarriage occurs it will be between the pure whites and those who are more white than black, and who should, in a race census, be classed with whites. With such marriages mutual attraction will no more interfere than in the case of marriage with Italians or Spaniards, with whom a mixture of darker blood many centuries ago has changed blonde to brunet. States which have laws against color ought to define what infusion of black blood makes one a negro. Certainly a quadroon, and much more an octoroon, is rather Caucasian than negro and should be so counted.

What Mr. Wells, following M. Finot, calls Gobinism, or the doctrine of the inequality of races taught in four volumes by Count Gobineau, is precisely what, in the same year, 1854, Nott and Gliddon published here in their "Types of Mankind," showing how superior the Caucasian race is in every way to other races, and especially to the black race. It had great influence, for its show of learning, and its assertions are still quoted as scientific verities in defense of race prejudice. The fact seems to be that in intellectual power the races so overlap that the most we can say is that one race may average a little higher than another, but that even this it is not safe to assert until the process of culture and education has given all races an equal chance to prove what is in them. The lesson of Japan gives startling evidence on this matter. But whatever the final conclusions of comparative psychology the ethics remains clear, that every effort should be made to break down the haughty race prejudice which has disgraced the history of Anglo-Saxondom.

Our Institutional Liberty

IT is interesting to see how solicitous corporation officials and their attorneys are becoming for the preservation of our political institutions.

We have entered upon a period of governmental regulation of business which, for energy and comprehensiveness, is without precedent in our history. Railroad traffic is especially the object of this policy, but the trusts in general come in for their share of interference. The new experience is making the captains of industry strangely sensitive to a difference which, with the aid of gifted counsel, they are pleased to describe as the difference between a government of laws and government by personal or parliamentary edict.

This antithesis is hardly a new discovery. It is set forth, for example, in a work of such respectable age as the "Politics" of Aristotle, and every important political philosopher for two thousand years has had something to say about it. However, each generation has to acquire its own education, quite as if the things it learns had never been learned before, and we are glad to see that our business classes are becoming interested in questions more serious than those of stocks, bridge and motoring.

It was obviously the intent of the framers of the Federal Constitution to establish free trade among the States. Nevertheless, power was given to Congress to regulate interstate commerce, and Congress is now exercising this power by giving to a commission authority to deal in a radical fashion with interstate transportation. Mr. Knox, as Attorney-General, thus stated what he understood to be the general doctrine underlying this exercise of power:

"Congress may deny to a corporation, whose life it cannot reach, the privilege of engaging

in interstate commerce, except upon such terms as Congress may prescribe to protect that commerce from restraint. . . . . Such a regulation would operate directly upon commerce, and only indirectly upon the instrumentalities and operations of production."

It is in the spirit of this doctrine and in full accordance with it that President Roosevelt would have Congress further control interstate commerce and indirectly control the entire economic life of the nation by subjecting all corporations doing an interstate business to a system of licensing.

All this is undoubtedly, from one point of view, a departure from the policy of perfect freedom of trade between State and State. Undoubtedly, also, it is the evolution of governmental methods which partake rather of the nature of "personal or parliamentary edict" than of an enforcement of general laws. It is necessary, however, to point out to the gentlemen whose newly awakened concern for our inherited liberties is so acute, that there is still another difference, quite as fundamental as the one which now interests them, and which the American people is probably quite as determined to respect as it is to maintain a government of laws.

When the Constitution was adopted, its principles were supposed to apply to ordinary human beings, to natural persons. That world of artificial persons known as corporations, created by the state, which now dominates the community of natural persons, had not then come into existence. That natural persons should be permitted to trade freely one with another thruout the national domain seemed a thoroly reasonable proposition. It has not ceased to be reasonable. That natural persons should live under a government of laws, rather than of personal or parliamentary edicts, was a proposition for which our forefathers were willing to spend powder and shot. We suspect that their children would be willing to fight for it strenuously today. Absolutely different is the proposition that our artificial persons, grown to the estate of legal monstrosities, exercising an ill-gotten power to restrain the economic and individual liberty of natural persons, should be treated in all respects exactly like natural persons, and subjected to no more regulation. The American people, other than the corporation personnel—including lawyers—is alread beginning to see this distinction clearly, and we trust that the political education of the corporation personnel also will continue.

"What ails the United States" can be told in a very few words. We have extended to property, as such, and to corporations, as such, doctrines of liberty that originally applied only to natural persons, and that in common sense are still applicable only to them. And we have carried this perversion so far that today it is property and corporations, rather than natural persons, which enjoy a maximum of liberty.

The corporations must be subjected to so much restraint, arbitrary or otherwise, as will suffice to restore his lost and rightful liberties to the natural individual.

Nostrums

It is now generally admitted that advertisements of drugs and remedies for disease and special methods of treatment, when appearing in non-medical journals, are never likely to be above suspicion and are commonly to be classed as out and out frauds on the public. All of the high-class magazines have confessed this by excluding such advertising from their pages. Many of the better class newspapers have done the same thing, and there is a very general feeling that the publicity afforded such advertisements has done great harm in the past. There are still a certain number of papers, however—some of them priding themselves not a little on their efforts to prevent the people from being wronged in any way, the proprietors of which indeed make many striking displays of their asserted unselfish purpose to benefit the people—which still continue to publish such advertisements. Their plea is, of course, that the people must be allowed to judge for themselves what is good for them when ill, and that there may possibly be some new discovery in medicine which might accomplish great good, yet the effect of which would be lost for a long time unless it were brought prominently before the public, as every other good thing is, by means of advertising.

This specious reason can, however, have very little weight (if in the past it has had any) since the publication of the investigation by the United States Department of Agriculture, thru the Chief of the Drug Laboratory of the Bureau of Chemistry, of many of the nostrums which have been most advertised thruout the country during recent years. The results of this investigation were presented before the meeting of the American Medical Association, and are lately published in the Journal of the association. This investigation included not only an analysis of the drugs as they were offered for sale in the open market, but also a comparison of the known effects of the ingredients of these remedies with the claims that were made for them by their advertisers. The analyst of the Bureau of Chemistry does not hesitate to make the title of his paper "Nostrums and Fraudulent Methods of Exploitation," and he succeeds in showing without any difficulty that, while in most cases the remedies advertised are of little or no benefit, when they are of any use it is only because some well-known medical formula has been taken and all sorts of wonderful effects ascribed to it in order to tempt the public to buy it.

Previous exposures of the frauds connived at by medical advertisements might seem to have been dictated by sensational journalism or some other motive that detracted from their value. The late investigation, however, has been conducted entirely with the idea of getting at the true inwardness of the patent medicine situation and determining what the possible benefits to be derived from these remedies might be. The verdict of the experts in the United States Department of Agriculture must be final, and no newspaper editor can now have even the pretense that he is not sure that the claims made by such advertisers are fraudulent, since they have been proven to be so by authorities that are above all suspicion. The newspapers are simply allowing themselves to be used for defrauding that most pitiable class in the community—sufferers from disease—by men who have no idea at all of curing human affliction, but only of making as much money as possible.

If the money question were the only one involved, however, the situation would be not quite so serious as it actually is. Unfortunately, as was brought out very forcibly in this investigation, because of confidence in such remedies as they have been tempted to buy because of newspaper exploitation, sufferers from disease often delay their recourse to the only methods of treatment that can possibly do them any good to such time that they are no longer susceptible of improvement. This is especially true for the two most serious pathological conditions which mankind faces at the present moment—consumption and cancer. Poor sufferers from consumption are tempted to spend the little money they possess for drugs, when they should be taking the open-air treatment and spending all that they can spare securing for themselves better nutrition than before. The advertised remedies for consumption are of such a composition that only too often they deceive the ailing into the belief, at least at the beginning, that they are actually doing them good. Most of these remedies contain alcohol and opium. Alcohol gives the patient a false sense of well being and a feeling of strength that, with the confidence in the remedy, for some time at least makes him feel better than before. Alcohol is, however, a very dangerous drug for consumptives, because it produces a depressive reaction, which leaves the patient worse than before it was taken. There is now no good authority in the treatment of consumption who recommends its use. Opium is even more dangerous. It does quiet the cough, and therefore gives the patient the feeling that he is better, but it locks up the secretions, decreases the appetite, on which the patient's recovery absolutely depends, and because it lessens the cough leads to the accumulation of broken down material in the lung that nature intended should be removed by expectoration.

With regard to cancer, the effect is, if possible, worse than in the matter of consumption. For all forms of cancer not on the surface of the body the only remedy that gives any hope of radical cure is a surgical procedure. If the pathological condition is recognized soon enough and the new growth removed in an early stage, a complete cure occurs in more

than one-third of the cases. If the early stages of the disease are once allowed to pass without recourse to this remedy, then the case becomes hopeless, and the best that can be expected from any treatment is some relief of symptoms, with possible prolongation of life. The advertised cancer remedies all tempt people to put off the radical treatment of the disease, and many lives are thus lost and much suffering that might otherwise have been averted is made inevitable.

The Government investigation brought out extremely interesting facts also with regard to that much advertised class of remedies known as the restoratives which are supposed to give back lost manhood and cure weakness in men and nervous debility, and the many other conditions that are so shamelessly flaunted in the pages of what claim to be reputable newspapers. These are the meanest frauds and serve to show how low men can fall in their desire for money at any cost. They are scarcely more fraudulent, however, than the advertisements of remedies which are supposed to produce wonderful effects in rounding out the forms and figures of the thin or taking off the excessive avoirdupois of the obese. The whole gamut of exploitation of the public is run by these advertisers, and newspapers that now permit themselves to be used by them cannot hide behind any false claim that they do not know of the almost criminal nature of the concerns whose advertisements they accept. Without the connivance of newspapers this great fraud upon the public would cease at once.

Encore! Encore!

THE people between the Rhine and the Channel are very different from their neighbors beyond. Long ago would Germany have cut the Gordian Knot with a blow, just as England would have compromised. France, however, wishes to settle affairs, clearly, logically, finally as witness during the past year the rehabilitation of General Picquart and Major Dreyfus. Step after step of the French Government has the Vatican condemned, until now it rejects a form of contract, drafted to conform to the recent decision of the French hierarchy which Rome had agreed to: because forsooth the Vatican regards this contract as an underhand attempt against its own rights and those of the French hierarchy. As tho it were good politics to read underneath the running page and fish out hidden motives.

Possibly the recent defeat of the Socialists in Germany may have something to do with Rome's latest ban. It foresees that the conservative element in France will be stimulated to repeat there the success, more apparent than real, of Germany. As always it looks to win by fishing in troubled waters. Back in 1870, hoping to repeat the reaction, which followed the revolutionary year of 1848, it had wished to split the nations by the promulgation of Papal Infallibility, which made the Vatican the chief police force of Christendom. But the plans of the ultramontanes lie buried in San Lorenzo with *"Ossa et cinera Pii Papae IX,"* as his tomb's inscription reads, but like the flowing Tiber alongside, the wilful world goes on its own sweet way. Since then Germany and Switzerland have had their *Kulturkampf* and victoriously. Rome accepted their respective worship associations or at least tolerates.

France, logical and just, is now in the eddies which break upon the Leonine city. At this very moment the outlook is critical. Rome expects the windup of the Clemenceau Ministry, whose work is arduous. Besides the budget, the income tax and the legal day of rest give anxious moments to the leaders. The conservative elements oppose the income tax and also wish the legal day of rest to remain as now, viz., a full abstention by every wage-earner from work for twenty-four continuous hours every week. On the other hand, the Socialists favor the income tax, but demand that Sunday be made the legal day of repose. Clemenceau thus may be lost between income Scylla and holiday Charybdis. Jaurés, the leader of the Socialists, dubbed the recent condescension of the Government to Rome "A Concordat of the churches"—*i. e.*, of the buildings proper. The Concordat now abolished regarded the appointment of bishops and

pastors; the present step affects the places of worship only. Rome, as always, banks upon time and plays a waiting game. Uselessly, we believe. In the first place, the press supporting the Vatican does not represent Republican France. *Le Soleil, Le Gaulois,* and, after a fashion, *Figaro,* are monarchical; *L'Eclair* is known to be owned chiefly by the Jesuits; *L'Autorité* is the quasi-official organ of Cardinal Richard; *La Republique Francaise* is a contradiction to its very title. These and similar newspapers attack the budget and the proposed income tax, but they reach a limited circle of readers, who may be reckoned among the half-million, that will feel the pinch of the new income tax, if it become a law; whereas, the many republican, radical and socialistic papers reach the masses.

Again, Rome has never understood socialism, which it identifies with revolution, anarchy, disorder, and steadily condemns it, while at the same time it has little to say of the Camorra of Naples and the Mafia of Sicily. Hence the attitude of Rome toward this great movement is generally regarded in France as purely political. It seems her share of the police work needed to maintain the present established economic order.

The Vatican, too, is silent upon another plank in the Socialist platform—disarmament. This and Sunday as the legal holiday appeal to the millions of French men and women, who are ground between oppressive taxes and unending labor. Clemenceau may go under. If he does the Socialists will probably be the gainers. Whether or no, Rome has no chance of recovering the ground now lost. Napoleon's Concordat is dead and buried beyond hope of resurrection. In conclusion, we may add that we see in the election and induction of Cardinal Matthieu among the forty immortals of the French Academy nothing more than a fresh sign of how strong traditions are in France. Churchman has been looked upon as a sort of rounding out to the professions, which the Academy honors. To the voters of France it amounts to nothing whatever who are or are not immortals.

The Farmhouse in Winter

MANY folk think that winter is endurable only where there are amusements in the way of theaters, clubs, musicals and parties. That is altogether as we are educated, and one may be educated into a great many blunders. The country is just as capable of winter pleasures as the city; yet the keynote to a contented life is a cultivated capacity for finding pleasure in our everyday employments. In the country a co-operation of hand and brain will charge every hour with interest. It is true that there was a terrible interlude when the old-time country life had departed and the new country life had not shaped itself—a dull and dreary time it was. The old farm life took in a hundred industries; from cider to soap, from candles to carpet making. It spun, it wove, it knit, it sewed, and it even manufactured shoes and shod horses, made its own brooms and built its own houses. Never before in this world was any life so charged with tact and interest, with what the Westerner calls "get up and get," as was New England farm life. But steam stole all these industries, carried them off to factories, and left country life stale, especially in the winter. The boys and girls ran after the vitality of the world and became manufacturers.

The new farm life is something entirely different, or is steadily becoming such. The editor would take you to a farm yard. It is a wholesome place, well drained with tile, while a pump draws water from an artesian well. The stable floors are grouted with Portland cement and gravel, while the cows stand in box stalls. The men are tidy, and tobacco is forbidden on the premises. There is perfect ventilation, and the hay smells sweet as June. When milking time comes, wonder of wonders, no one bends himself to the task; a milking machine goes the rounds and does the work perfectly. The editor remembers how he used to count the pulls on the teats, while he got cracked with the bovine tail, or possibly tumbled with a vicious kick.

Leaving the barnyard you enter the farm shop; a most delightful home for

the boys and the wholesome farm girls, too—where they meet the industrial age and school themselves without a master. A farm shop not only saves, but creates; and all in all is the art gallery of a genuine country home. A gallery of paintings, or craft wrought by other people, is by no means as interesting as one wrought out by the intelligent handicraft of the owner. Here the educated brain finds prompt expression thru the fingers. Over the shop, and of equal size, is found the laboratory; really another workshop where such sciences as chemistry, geology, entomology, ornithology and botany have each their corners or cupboards; but most favored is entomology, for what can a farmer do in these days if he do not comprehend and cannot compete with the bugs? Here, and in the shop below, is the whole poem of life, and the stanza of each day's good living is put into a sweet song. The visitor will note that the apple cellar was very near the workshop.

This is the change that has taken place, and once more country life is charged with vivacity and pleasure. The problem now is how fast the countryman can change himself or be changed to fit his new environments. He must get out of his narrow social and political ruts, he must enlarge his vision, and he must be willing to be renewed in both the outer and the inner man. It is no wonder that city folk begin to pour outward and talk about going back to Nature. It is not the old Nature that they will find, but Nature a hundred years in advance of the old, and Nature charged with a new purpose. They will find progress and change everywhere and in all things. Every true farmhouse is bound to become a department of the State Agricultural College. Here and there a rich mandarin is building a country palace. He is nothing short of a fool. The old suburbanism, with its stately mansions, has passed away. You cannot any longer build the country into brick and mortar. You cannot go back to Nature by dragging conventionalism into the woods. When a man has surrounded himself with extravagance, and has become a victim of servants, he is worse off than in the city. This is especially true in the winter. To know Nature one must know her in her nooks and her simplicities.

The cunning art with which Nature manages us is curiously interesting. Winter never comes on to us at once. A frost in September generally forewarns us that the summer is ended and that we must get ready for a change of the seasons. The beans and squashes and tomatoes hang to limp vines, and one may as well carry in the last basketfuls—of course with a twinge of regret. A wise horticulturist has broken down a few poles of his beans and tomatoes and covered them with straw or hay. In this way he bridges over a few frosty weeks, and may get a choice dinner of golden string-beans as late as November. However, Nature does not count on this. What she means is to hint to us, somewhat sharply, that we must be ready for winter. She hardens us by degrees, so that we scarcely appreciate the terrible squeezes of zero—a temperature that would kill the whole of us if it came suddenly. The leaves are loosened on their stems, for if the snow were to fall before the leaves were fallen there would be a deal of devastation in our orchards and groves. Brittle-limbed trees, like butternut, ash and willow, shed their leaves first. The oaks and the beeches can be trusted to keep their summer clothing a little longer, for their limbs are tougher to bear a snowfall. Evergreens are built for bending, in a way to slide off huge loads. They may hold their leaves all winter and are seldom damaged. Your evergreen hedges, however, are more artificial, and will need your help when the moist snow lies heavily.

When the banks of snow are piled all over our fields and roads, the countryman lights his hot-water furnace, moves into his library, or into his laboratory and shop with his boys, and still keeps up his conference with Nature. He does not make shoes, like his grandfather, nor do his wife and daughter make soap, as in the good old days; instead, you will find him in the entomological corner, studying up the subject of spraying, or the best method of fighting the San José scale or the gypsy moth. He is most likely in correspondence with the Agricultural Department at Washington and half a dozen State Experiment Stations.

So this farmhouse among the snow banks is really a branch of the United States Government—as all the people ought to be. The farmer no longer needs the tavern or any other loafing place. The rural carrier whistles at the gate and is ready to carry the investigations of the family to headquarters, while he brings a package of bulletins.

City Snow

Where is the great American genius for invention? The alert, enterprising, original mind, with its ceaseless stream of patents for saving labor and reducing expense? Here is the greatest and richest city in this great and rich country meeting the inconvenience, expense and danger of snow-clogged streets with methods comparable to grinding corn by hand. All the other snow-clogged cities are doing the same; but it seems singularly ignominous here. This elemental inconvenience falls upon us, delays trade, impedes traffic, injures health, interferes with comfort and happiness to an enormous degree, and we crawl out to meet it with a string of little wagons and scrape at it with shovels—by hand! By hand. By one-man power. A horse plow clears the paths in the park; and the car lines clear their tracks with engines, the buzzing brooms revolved by machinery. But the miles on miles of streets are slowly, painfully and most imperfectly cleaned by strings of casual laborers, undrilled, unorganized, puttering away with their little shovels like children playing with sand. We have learned to build and plan for rain, why not for snow? Our streets are not impassable with puddles, why with drifts? The rain runs away and takes care of itself, true; and the snow does not, true; therefore we must invent other methods of dealing with it. The street railways have some machinery to deal with their particular strip of property; but they deal with it in a most characteristic way—by rapidly sweeping the snow off their strip onto the rest of the street, for the city to deal with. How if those car lines, with their costly privileges of transit, were utilized to help remove this public burden? They do not promote traffic so considerably by piling the snow at the sides; traffic merely takes to the track and impedes the cars. There are two ways to remove these thousands of tons of white crystals: one the mechanical method of carrying it off in bulk, or in reduced bulk perhaps, and one by turning it to water and letting it carry itself off. Is there not enough mechanical genius in any American city thus incommoded to invent mechanical appliances to meet this need in either way, or in both ways?

The President of the United States is elected as a party leader. Altho President of all the people he can and must urge the policies he was chosen to represent. Yet it is hardly considered good form for him to enter personally into the conduct of an election or to gloat over its result. But a constitutional king is different. He is not chosen by a party, but rules in accord with any party which may succeed. What a President chosen for a term can do King Edward cannot do. To be sure the German Kaiser does take strongly the part of a party, and makes a triumphant speech over the defeat of the strongest party, but such action is extra-constitutional, and we do not wonder that it excites grave criticism.

Our American Legation guard in Pekin wrecked a low Korean resort, and now the soldiers refuse to tell who did it, all saying they do not know. Probably they have not heard of the Brownsville raid and how President Roosevelt dismissed "without honor" the whole squadron who would not tell on their companions. We are watching with great interest the investigation by Senator Foraker's committee of that Brownsville affair. Thus far the witnesses know nothing, but believe it was Mexican and Texan rangers who "shot up the town."

Governor Vardaman proposes to go to the Senate from Mississippi, and they say that the State is likely to elect him in preference to such a scholar and gentleman as John Sharp Williams, Democratic minority leader of the House. With him in the Senate, and Tillman, from South Carolina, and Jefferson Davis, from Arkansas, the South will be represented in a very different way from what it was when it sent statesmen of national renown to the Senate.

Insurance

The New York Life Insurance Company

ALEXANDER E. ORR, who has occupied the office of president of the New York Life Insurance Company for a little over a year, is about to retire as head of this great company. In this connection it is interesting to note Mr. Orr's emphatic denial that the management spent the company's money in the recent campaign for the election of the administration ticket. Mr. Orr also stated that it was untrue that the management was seeking to impede the canvass of the vote. The financial condition of the New York Life is now even more satisfactory than it was at the close of 1905. These statements, on the part of the retiring president, are made by him for the purpose of allaying fears and correcting misunderstandings on the part of certain policy-holders who have become alarmed and in certain cases have gone so far as to surrender their policies thus sacrificing not only the protection which insurance affords but a considerable portion of their savings as well. The year 1906, while it was a period of severe trial for all insurance companies, accompanied as it was by agitation, criticism and the circulation of misleading reports as well as unprecedented shrinkage in the market value of the very best classes of securities in which the New York Life in common with other insurance companies is a heavy buyer, did not, however, adversely affect the financial solidity of the New York Life. Large curtailments in the matter of law expenses, advertising, salaries and rents and other economies were marked features in the management of the New York Life during the period now under consideration. Mr. Orr, in a long letter to the policy-holders of the New York Life, incidentally pays a high tribute to the purposes, plans and the efficiency of the men who do the work by day in the company's home office as well as the men engaged in its principal outside offices. He characterizes them all as devoted to their work, admirably trained, and fully to be trusted with the administration of the policy-holder's interest as they are safeguarded by the board of trustees. Mr. Orr confidently looks forward to the time which he believes close at hand when public sentiment will be educated to a better appreciation of the great advantages to the people that will accrue from carefully administered life insurance companies. The present condition of the New York Life is indicated by the general balance sheet which shows assets of $474,567,673. The real estate now held is appraised at $12,750,897. There is a total of $98,799,374 in secured loans of which $35,579,554 are on mortgages and $53,795,274 on companies policies. The statement shows that the company has disposed of all its stocks. It has railroad and other bonds to the market value of $271,448,436, and Government, State, county and municipal bonds to the value of $69,243,519.

THE Royal Arcanum suffered a great loss in the recent death of Mr. W. O. Robson, for some years Supreme Secretary of that fraternal order. The Royal Arcanum owes much to the keen judgment and foresight of this man, who for twenty years guided the society as its one permanent administrative officer. He was active in the two readjustments of rates in the Royal Arcanum. His death was due to an attack of pneumonia. He was over sixty years of age when he died. He was progressive in method and invariably supported progressive measures.

ACCORDING to a writer in *The Insurance Journal* of London, few appreciate the enormous toll the sea demands of shipping interests each year. According to the records of 1905, there were lost 389 steamships and 649 sailing vessels, a total of 1,038—in other words, the ocean devoured three ships for every day of the year. Could there be a more forceful lesson to show the absolute necessity of marine insurance?

THE Fidelity Fire Insurance Company of New York, which was started last June with a capital of $1,000,000 and a net surplus of $1,000,000, has a reserve for unearned premiums of $278,616.10 and a special reserve for unearned premiums of $441,195.95, and total assets of $2,759,367.28. The offices in New York are at 46 Cedar street, and the Western department is at 280 La Salle street, Chicago, Ill.

Financial

Currency Legislation

It is now expected at Washington that favorable action will be taken by Congress before the end of the present session upon two propositions which were included in the scheme of currency reform recommended by the Bankers' Association and the New York Chamber of Commerce. Discussion at the weekly meeting of the Senate Committee on Finance, on the 5th, disclosed a willingness to add these propositions, or the substance of them, to a pending bill, passed by the House in May last, providing for an increase of the volume of bills of small denominations. It is reported that the amendments will be brought forward this week by Senator Aldrich, the committee's chairman. One of them, it is predicted, will increase from $3,000,000 to $12,000,000 the amount of national bank notes which may be withdrawn from circulation in any one month. The other, which is of greater importance, will remove the restrictions which prevent a deposit of the current customs receipts in the national banks, as internal revenue receipts are deposited. There ought to be no difficulty in securing the enactment of both these propositions. To promote elasticity, the retirement of notes should no longer be limited to $3,000,000 in a month. There should also be new legislation permitting and authorizing an increase of circulation at the times when an increase is needed. But no bill for emergency issues can be passed at this session, and a modification of the restriction upon retirement will be a beginning. Customs receipts should be put in bank and should not be locked up in sub-treasuries, there to be retained until the Secretary chooses to release the money, from time to time, in large blocks. The money paid by our citizens in customs dues should not be withdrawn from the channels of trade. Under the present law the withdrawals are, as a rule, largest just at the times when currency is most needed for the transaction of business.

*

....Gross earnings of the railways for the calendar year 1906, according to the *Financial Chronicle*, showed an increase of $224,062,452, against an increase of $152,039,634 in 1905, and one of only $11,137,487 in 1904.

....It is officially announced that beginning with June next the entire passenger service of the New York, New Haven & Hartford Railroad Company between New York and Stamford, Conn., will be equipped for the use of electric power.

....The responsible officers of the Royal Bank of Canada may reasonably be proud of the condition of that institution, as shown in its annual statement, which we published last week. The bank's deposits are $32,550,676, its capital is $3,900,000, and it has a reserve of $4,390,000.

....E. H. Rollins & Sons, the well-known bankers, make some interesting suggestions to conservative investors in an advertisement which we publish this week. Their comparison of the merits of first-class municipal bonds with those of the current short-time notes deserves consideration.

....Fall River cotton factory dividends for the last quarter of 1906 amounted to an average of 2.56 per cent. This was the best quarter for several years. The total does not include a stock dividend of 100 per cent. by one company and a similar dividend of 33⅓ per cent. by another.

....The Columbia Trust Company, of 26 Nassau street, this city, is issuing an attractive brochure containing the address delivered by Clark Williams, vice-president of the company, before the American Bankers' Association at St. Louis last October. The text has direct bearing upon the responsibility of trust company employees to the patrons of such concerns. The Columbia Trust Company, barely a year old, now has deposits of $6,927,000.

*

....Dividends announced:

Niles-Bement-Pond Co., common, 1½ per cent., payable March 20th, and 1½ per cent., payable June 20th, 1907.

Niles-Bement-Pond Co., preferred, 1½ per cent., payable February 15th, 1907.

International Silver Co., preferred, extra 1 per cent., payable March 1st, 1907.

Survey of the World

The Controversy with Japan

A settlement of the controversy with Japan appears to have been reached by means of an amendment attached to the Immigration bill now pending at Washington. This amendment, adopted in the Senate on Saturday last, is as follows:

"Whenever the President shall be satisfied that passports issued by any foreign Government to its citizens to go to any country, other than the United States, or to any insular possession of the United States, or to the Canal Zone, are being used for the purpose of enabling the holders to come to the Continental territory of the United States to the detriment of labor conditions therein, the President may refuse to permit such citizens of the country issuing such passports to enter the Continental territory of the United States from such other country or from such insular possessions or from the Canal Zone."

It was suggested by the State Department, on the 12th, to the conference committee which for a long time had been considering the disagreeing votes of the two houses on the Immigration bill. As a result of the conferences between the representatives of San Francisco and the President, there was an agreement substantially to the effect that the order of the city's Board of Education would be rescinded if provision for the exclusion of Japanese laborers should be made. Knowing that the Japanese Government desired to prevent the emigration of Japanese laborers to this country (preferring that they should go to Manchuria or Korea), our Government sought a method of exclusion which would not offend Japan and would at the same time satisfy San Francisco and the Pacific Coast. Mayor Schmitz at first proposed that separate schools in every way equal to those attended by white children be provided for the Japanese. To this Japan objected. It is understood that he and his associates then consented to rescind the Board's order and to admit Japanese children to the general public schools upon condition that Congress should first adopt the amendment suggested by the State Department, the expectation being that the provisions of the amendment would in the near future be included in a treaty. On the 14th it was announced at Washington that the amendment was acceptable to Japan, altho at the same time assertion was made in special press despatches from Tokio that public sentiment there was decidedly opposed to any settlement of the school controversy conditioned upon a restriction of the admission of Japanese laborers. On the same day the bill, with the amendment, was reported to the Senate. Mr. Tillman, Mr. Bacon, and some other Democrats sought by filibustering methods to prevent prompt action. Obstruction ceased on the 15th, when it became known that an extra session would be called after March 4th if final action should not be taken before adjournment. Bitter speeches were made on the 16th by several Democrats. Mr. Dubois asserted that Japanese immigrants were more objectionable than Chinese, for moral as well as for economic reasons. Mr. Patterson said that the granted power could not be exercised by the President without giving offense which might cause war. Mr. Carmack remarked that the Federal Government and a sovereign State had been browbeaten by a foreign Power into surrendering the State's right to control its own affairs. Mr.

Culberson supported a movement for a bill to exclude Japanese coolies, and upon a point of order relating to the consideration of such a bill the only vote was taken. The Senate thus indirectly approved the Government's pending proposition by a vote of 45 to 24, substantially upon party lines, and then the amended bill was passed without a division. Similar action in the House is expected. This, it is understood, will be followed by concessions in San Francisco, a dismissal of the test suits at law, and the negotiation of a treaty with Japan.

Tariff Revision

There was sent to Washington, from Boston, on the 12th, a tariff petition signed by Governor Guild and 221 of the 280 members of the Massachusetts Legislature, including the President of the Senate and the Speaker of the House. In the Legislature there are 203 Republicans, and the names of 154 of them were attached to the petition, which was addressed to President Roosevelt and Congress. It approves "the principle of the creation of maximum and minimum schedules, to be applied without the intervention of treaties" in granting reductions in return for concessions from other countries. It continues as follows:

"We further favor the establishment of a tariff commission that shall impartially investigate and report from time to time to Congress when schedules appear to be in need of modification, where duties once needed for the protection of American industries have become or may become obsolete or unnecessary, or, on the other hand, where new industries may require new protection or new expenses may call for further revenue.

"We respectfully urge upon the President and the Congress immediate action along these lines, and should the limitation of time make this impossible in the present session of Congress, we respectfully petition the President to use the powers placed in his hands for the consideration of this subject without further delay."

In an address at a Republican banquet, last week, Governor Guild said: "If the Republican party does not grasp this question of tariff revision and settle it, some other party will, and we shall then risk the same industrial smash-up that came when, in 1893, revision was entrusted to a party sincere in protest but insufficient in constructive statesmanship."——Ten of the eleven Republican members of the House from Wisconsin, together with Senator La Follette, are on record in favor of revising the tariff at an extra session of Congress, beginning shortly after March 4th next. In the course of debate, last week, Senator Spooner said he thought many of the present duties were too high. He has since remarked that there will be no extra session for tariff revision.

Mr. Roosevelt's Land Policy

President Roosevelt sent to Congress, on the 13th, a long message pointing out the urgent need of legislation concerning the public lands. Much of this message relates to land containing coal. "Mineral fuels, like the forests and navigable streams," the President says, "should be treated as public utilities." This, he continues, is generally recognized abroad, where some Governments are trying to regain that control of fuel resources which was unwisely permitted years ago to pass into private hands. Our own Government "should not now repeat the mistakes of the past:"

"Let us not do what the next generation cannot undo. We have a right to the proper use of both the forests and the fuel during our lifetime, but we should not dispose of the birthright of our children. If this Government sells its remaining fuel lands they pass out of its future control. If it now leases them we retain control, and a future Congress will be at liberty to decide whether it will continue or change this policy."

Such a leasing system as he proposes, he says, is by no means an untried policy. For fifteen years coal has been mined under Government leases in Australia. This method is now used in all the great coal-producing countries of Europe (Great Britain excepted) and in other British colonies besides those of Australia.

"It may be fairly claimed among the advantages of the leasing system that (1) it will facilitate the working, under favorable conditions, of coal deposits for local markets by miners without large capital, as no land-purchase money would be required and the small royalty charged would be paid out of the earnings; (2) it will facilitate larger operations, as the leases could be made sufficiently liberal in the matter of time, area, and other conditions, to induce healthy competition and meet all real demands, and yet in all cases the general supervision of the Government could be such as

to (3) prevent waste in the extraction and handling of these fuels; (4) the system can be operated in such manner as to prevent the evils of monopolistic control; (5) that it will permit the Government to reserve from general use fuels especially suitable for metallurgical and other special industries, and (6) it will enable the Government to protect the public against unreasonable and discriminating charges for fuel supplies."

Private holdings of coal lands in the West amount to not less than 30,000,000 acres, or about one-half of the total area of coal and lignite. With the remaining half reserved and leased by the Government, it can be shown in the near future whether private ownership or the leasing system is to be preferred for the public good. "It would surely be greatly to the advantage of this country," the President says, "if some, at least, of the coal fields of the East, and especially of the anthracite fields, had been left under the control of the Government. Let us provide in the West against a recurrence of the conditions which we deplore in the East."

"I cannot too emphatically say that all laws which merely seek to prevent monopoly or the mishandling of the public by forbidding combination, are certain to fail of their purposes. An experience with the Interstate Commerce and Anti-Trust laws shows that what is needed is not prohibition of all combinations, but such supervision and control over combinations, and over corporations entering into them, as will prevent the evils, while giving to the public the advantages, of combination."

He would have the public pasture lands controlled by grazing leases and under small fees, but with due regard for the homesteader and small stockman. Asking for an additional appropriation of money needed for the detection and prevention of fraud, he says:

"I wish to express my utter and complete dissent from the statements that have been made as to there being but a minimum of fraud in the actual working of our present land laws I am exceedingly anxious to protect the interests of *bona fide* settlers and to prevent hardship being inflicted upon them. But, surely, we are working in their interests when we try to prevent the land which should be reserved for them and for those like them from being taken possession of for speculative purposes, or obtained in any fraudulent fashion."

Referring to examples of fraud, he summarizes the results of an examination of the record in four districts, where the law had not been complied with in more than half of the 2,300 cases reported, and in "very many cases deliberate fraud" was found. "It is the earnest wish of the Administration," he says in conclusion, "to discontinue the advertisement of fraud in connection with the public land system; but the only way to accomplish this is by putting a stop to the fraud itself."

The Panama Canal

Because of a misunderstanding, the members of the present Isthmian Canal Commission who were appointed in recess, and whose appointments were not confirmed at last year's session of Congress, were neither re-appointed after adjournment (on June 30th) nor renominated at the beginning of the session now in progress. It is said that on this account they have been holding office without legal authority since June 30th, when their appointments lapsed for lack of confirmation, but it is not expected that the legality of any of the Commission's acts will be questioned. On the 14th the President nominated to be members of the Commission, Chairman Shonts, Chief Engineer Stevens, General Hains, Admiral Endicott, B. M. Harrod, Col. W. C. Gorgas and Jackson Smith. The first five are now members. Colonel Gorgas (Assistant Surgeon-General, U. S. A.) is the chief sanitary officer on the Isthmus. Mr. Smith has charge there of labor, quarters and subsistence. Mr. Shonts will retire on March 3, and it is intended that Engineer Stevens shall then become chairman.——In a letter to the Commission, Engineer Stevens characterizes as "absolutely and unqualifiedly false" certain reports in the press that mud and water were encountered in drilling for the foundations of the locks and the great dam at Gatun. He adds:

"The drills have passed thru nothing and encountered nothing excepting the material I have described and the samples of borings which I have sent you. Nothing in any investigation which has been made during the last year and a half has tended to show but that the foundations of the Gatun locks will be as solid as the eternal hills, and any statements to the contrary are either the products of diseased imaginations or willful lies."

——At a recent hearing before the House Committee, Secretary Taft explained the form of contract upon which bids have been submitted, and gave his reasons for preferring the contract plan. It was probable, he said, that if the Oliver bid should be accepted, the con

tractor would receive his percentage on $60,000,000 or $70,000,000, amounting to about $4,500,000 in all. In his opinion, there was nothing in the contract form or in the laws to prevent the employment of Chinese by the contractor. In any case, the eight-hour law would be operative, as at present. It appears that the contractor is permitted to manufacture on the Isthmus the 4,500,000 barrels of cement that will be required, if he desires to do so, but cement so produced must be in every way acceptable to the Commission.

The Philippine Islands

There is much interest thruout the archipelago in the political campaign with reference to the coming election of members of the new Assembly. The National Progressive party is composed of those who support the Government and its policy. Another, the Union National, has been formed by Dominador Gomez. It asks for a definite statement by the Government of its purpose concerning ultimate independence.——In the province of Occidental Negros, where no similar disturbance had occurred in four years, a band of Pulajanes, on the 13th, attacked and burned two coast towns, killing six members of the constabulary. ——In the Senate, at Washington, a bill for an agricultural bank in the Philippines has been reported. A similar bill, introduced some time ago at the suggestion of the War Department, empowered the Commission to pass an act for the incorporation of such a bank and to guarantee income on the investment up to 4 per cent. The reported bill (like one under consideration in the House committee) is quite complicated and imposes many restrictions. The establishment of such an institution is desired by the War Department in order that holders of land may obtain loans at reasonable rates upon land security.

Collision at Sea

A collision, followed by great loss of life, occurred on the night of the 11th at the eastern end of Long Island Sound and within a few miles of Block Island. The side wheel passenger steamship "Larchmont," of the Joy Line, on her way from Providence to New York, was struck by the three-masted schooner "Harry Knowlton," and she went down in ten minutes. The collision took place at about 11 p. m. It was a clear night, and it is known that each boat was sighted by the other some time before they met. It has not yet been ascertained who deserves to be blamed for the collision. There appears to be no way of finding out just how many passengers were on board. The number was at least 130, and the officers and crew were 30 more. Of all these, only 17 were saved. Nine of these were passengers. The bodies of 76 of the dead have been recovered. Many were washed ashore; others were found in the steamship's boats and on her life-rafts, frozen to death. The temperature was below zero, and there was a sharp wind. A majority of those who left the "Larchmont" before she went down were in their night clothes and they perished before reaching land. It is known that two who were in the boats committed suicide because of their intense suffering. There is testimony from survivors that the captain, George McVay, was one of the first to leave the ship, and that the officers with him prevented at least one woman from entering their boat. McVay got safely to shore. He asserts that he and his associates sought to save passengers, but were blown away from the ship by the gale. The "Larchmont" was twenty-two years old and was not so fitted with water-tight compartments that she could keep afloat after such a collision.—— On the 16th, a New York Central express bound for White Plains was wrecked near 205th street, in the Borough of The Bronx. This was the second trip of the electric motor in connection with this train, and there is evidence that the speed was excessive. Four passenger cars were thrown from the track and dragged for a long distance. Twenty passengers were killed and more than 150 were injured.

Peace in Central America

War between Nicaragua and Honduras has been prevented by pressure which the two little republics could not resist. After their arbitration tribunal had given up its task, and while each republic was hurrying its army to the

boundary, they received from the United States, Mexico, Salvador, Guatemala and Costa Rica an identical note urging them to keep the peace and suggesting a further resort to arbitration. This action was the result of a conference at Washington between Secretary Root and the Ambassador from Mexico. It had the desired effect. Dispatches from the Presidents of the two republics say that peace is assured.——It is now expected that the new treaty with Santo Domingo will be ratified before March 4th. Reports from Washington say that all of the Republican Senators and a sufficient number of Democrats have agreed to vote for it. We gave last week the leading provisions of the treaty. In addition to those already mentioned, Santo Domingo is bound not to incur new debts or to modify her import duties, while the treaty is in force, except by consent of the President of the United States.

The Reform in the House of Lords

The opening of the Houses of Parliament by the King and Queen of England was not as spectacular as was expected, on account of the rain and mud, but the Speech from the Throne was of unusual importance, especially on account of its reference to impending constitutional changes. The King referred to the Kingston earthquake in the following words, emphasizing his thanks by a slight bow to Ambassador Whitelaw Reid, who was seated with the Diplomatic Corps:

"The earthquake at Kingston adds one more to the series of calamities that Jamaica and the other colonies in the West Indies have experienced. I regret the deplorable loss of life and the destruction of property. I have seen with satisfaction that the emergency has been met by the Governor and his officers with courage and devotion and by the people with self-control. The occasion called forth many proofs of practical good will from all parts of my empire, and I recognize with sincere gratitude the sympathy shown by the people of the United States and the assistance promptly offered by their naval authorities."

After referring to the visit of the Amir of Afghanistan to India, the King stated that some changes in governmental methods of India were under consideration, bringing them more in accordance with the wishes of the natives. The King also mentioned the proposed measures "'for further associating the people of Ireland with the management of their domestic affairs and otherwise improving their system of government in its administrative and financial aspects," and for the reform of university education in Ireland. The paragraph in the Speech from the Throne which attracted the most attention was the following:

"Serious questions affecting the working of our Parliamentary system have arisen from the unfortunate differences between the two houses. My Ministers have this important subject under consideration with the view of a solution of the difficulty.

In explaining this, Premier Sir Henry Campbell-Bannerman said that the treatment accorded by the Upper House to the Education bill and the Plural Voting bill, matters urgent in the present state of things, was discreditable, dangerous and demoralizing. There must be such a readjustment of the relations between the two Houses as to enable the Government to carry out the wishes of the people with a reasonable harmony. He admitted that the Government was opening enormous questions, but it was quite aware of the importance and seriousness of them. Sir Henry said that it was sometimes thought that the House of Lords acted as a watchdog guarding the statute books against mischievous and undesirable measures, but the prolonged somnolence of the watchdog was now suddenly succeeded by an access of bitter ferocity. He did not know whether somnolency or ferocity furnished the better ground for complaint, but the combination of the two was perfectly intolerable. He was not sure that he would not rather have a constitution where the representative body was very much under the control of the Sovereign than under the control of another chamber. Mr. Balfour, in replying for the opposition, said that he too felt assured that the country desired a change, but it was not of the House of Lords, but of the House of Commons. Lord Lansdowne, in the House of Lords, said that the Lords were left in entire ignorance of the direction in which the solution of the question was to be sought. It was deeply rooted in the public mind that whatever dangers were to be apprehended from an unreformed House of Lords were nothing

compared with those arising from an unrestrained House of Commons.

The Irish and the Woman Questions

As foreshadowed by the Speech from the Throne, the Government is taking up the Irish question as its first task. Mr. Augustine Birrell, who succeeds Mr. Bryce as Chief Secretary for Ireland, gave notice in the House of Commons that a bill would be introduced by the Government to establish an Irish Council. It had been at first proposed to make this Council entirely nominative, but John E. Redmond declared that the Irish party could not support such a bill; accordingly it was modified to make it partly elective and partly nominative. The Council will have extensive administrative but limited legislative powers. In the discussion Mr. Birrell placed himself upon record as a home ruler, in the following words:

"The Prime Minister and myself are perfectly satisfied that the only solution that would give satisfaction to the majority of the population of Ireland would be what is generally called a Home Rule Parliament. This being so, the Prime Minister would never make himself responsible for any measure which might obstruct or interfere with the fulfilment of these hopes."

Another radical measure in regard to Ireland is the announcement by Mr. Birrell that a bill will be introduced giving the Government power to take over the management of the estate of Lord Clanricarde. Mr. Birrell said that in India such measures had been found useful in preventing injury to property and tenants in the case of insane and drunken rajahs. Mr. Birrell added:

"I feel no aversion to make myself responsible for the passage through this House of a bill which would propose to treat Lord Clanricarde after the fashion of the Bombay Court of Wards. I would not propose to expropriate him, I would simply take from him the management of his estate. It has been pointed out that this estate is haunted by the ghosts of murdered men. It is not for us or for anybody to determine who are the real murderers. It is enough to know that such an estate is a danger to the community."

Lord Clanricarde in a newspaper interview denounces the measure as an atrocity of Indian barbarism. The estate of the Marquis of Clanricarde comprises 52,601 acres and is estimated to bring in over $104,000 a year in rents. The Marquis has been in Ireland only once in his life—to attend the funeral of his father, thirty-three years ago, and he refuses to make any repairs in the houses of the two towns on his property. The people are practically pauperized and over 360 families have been evicted by force. The Marquis is seventy-four years old, unmarried and lives in seclusion, devoting himself to picture collecting.——The women suffragists of England are very bitter against the Liberal party because of its refusal to take up their cause, notwithstanding the fact that they have usually favored it in political addresses. Two different methods are being adopted by the women for proving their power. One is to work against the Liberal candidates in any election for Parliament, and another is to invade the Houses of Parliament by a large delegation, and so attract public attention. The latter group, popularly known as the Suffragettes, organized an attack upon Parliament on the evening of February 13th, which lasted for six hours, and was only dispersed by the police reserves and a cavalry charge. Their leader was the aged Mrs. Despard, a sister of General French. Following her marched several hundred women, arm in arm, singing "John Brown's Body." The police formed in front of all of the entrances to the Parliament buildings and repelled the women as they charged, arresting those who showed violence. As rapidly as the crowd of women was pushed away by the advance of the mounted police they collected in other places, and finally had to be carried bodily to jail, screaming, kicking and tearing the clothes of the police. Altogether 56 Suffragettes were arrested and subjected to a fine of $5 to $10 each, with the alternative of a fortnight or a month in prison. They all chose imprisonment rather than promise to obey "any man-made law." In the House of Commons Hon. Claude Hay, Conservative, and James Keir Hardie, leader of the Labor Party, called attention to the disturbances and protested against using the House of Parliament as a fortress filled with police to protect their members against women. In reply Home Secretary Gladstone said that he had little knowledge of what was

going on outside, but that the measures employed were for the general convenience of the members, and he was sure no unnecessary violence had been used. Keir Hardie attempted to make a speech at Cambridge University, in Guild Hall, but the students of the university made such an uproar that he could scarcely be heard. Ths girls from Girton College, in the galleries, cheered his advocacy of women suffrage, but the male students threw oranges and lumps of sugar at him and attempted to break up the meeting by a bomb generating hydrogen sulfid.

Briand and Clemenceau

The divergence of views between Premier Clemenceau and his Minister of Education and Public Worship continues to increase and the fall of the Cabinet is considered liable to occur at any time. M. Briand has been conducting negotiations with Cardinal Richard, Archbishop of Paris and the head of the Roman Catholic hierarchy in France, and it is reported that they have come substantially to an agreement as to the form of lease of the churches. The concession made by M. Briand is said to be that in case of the death or removal of a parish priest the mayor will be obliged to accept as his successor, under the terms of the same lease, any priest designated by the Bishop. The leases are to be for a term of eighteen years. M. Clemenceau objects to any concessions to the Church or negotiations with the ecclesiastical authorities, and wishes to submit the modified lease to the Chamber of Deputies before adopting it. The supplementary separation bill introduced by Briand, doing away with the necessity of notification for the holding of public meetings, was passed by the Chamber, but rejected by the Senate. The measure is a very sweeping reform, because it gives to the French people for the first time liberty of public assembly unrestrained by the Government. The point objected to by the Senate is the clause permitting unauthorized public meetings "at any hour" of the day or night. The opposition to the Government is largely due to financial interests, which are alarmed at the proposed income tax. It is hoped by the financiers that if the present Government can be overthrown the income tax feature will be allowed to lapse. In case Clemenceau is put out, Briand is likely to head the new cabinet. The papers seized at the Nunciature in Paris by the French Government when Mgr. Montagnini, the Secretary, was expelled, have been under examination by the Government and are reported to prove that the Vatican has been, for the last two years, actively interfering in the internal politics of France, Spain and Germany. It is officially explained that the diplomatic correspondence preceding the rupture of the relations between France and the Vatican has been maintained inviolate, but 1,590 documents of later date have been retained by the Government and may be published.——Mme. Sarah Bernhardt has been appointed Professor of Dramatic Declamation at the Conservatory of Music and Declamation. The appointment was made in order that she might receive the Cross of the Legion of Honor. The Chancellery refused to accept of her nomination for that decoration on the ground that it could not properly be given to an actress.

De Martens on the Hague Conference

Prof. Frederick de Martens has been making a tour of European capitals as a special commissioner of the Russian Government to discuss the program for the next international conference, called by the Czar to meet at The Hague. Professor de Martens is one of the leading authorities of the world on international law, and is a member of the French Institute and of the Permanent International Court of Arbitration at The Hague. Interviewed in Paris by *Le Temps* on his mission, he said:

"I am charged by the Imperial Government to prepare the ground for the approaching conference, to prevent misunderstanding among the principals interested by precise explanations, and to avoid any surprises and equivocations which might arise in the course of the debates. I have just come from Berlin, where I conferred with the German Government and with Mr. Charlemagne Tower, who was empowered by the United States to discuss the subject with me. Last spring the Imperial Government of Russia invited not merely as the first time the Powers represented at St. Petersburg, but all the Powers without any exception to unite in a conference designed 'to give a new development to the humanitarian principles which served as a

basis of the work of the great International Reunion of 1899.' Our program was intended to include precise questions susceptible, it appeared to us, of positive regulations, as, for example, improvements in international litigation and the laws of war on land and sea. No objections, I believe, have been presented upon any of these points. All of the participating States accept the discussion of the program established by us.

"Now the question is complicated by the fact that from two quarters, from London and Washington, an intention has been manifested to introduce into the program problems which we have deliberately concluded ought not to be put there. The first of these problems is that of the limitation of armaments, and the second is the Drago Doctrine. Sir Henry Campbell-Bannerman in his speeches has pledged himself to introduce into the conference a motion in favor of limitation. Analogous manifestations on the part of Mr. Roosevelt authorizes us to think that he has the same intention. The President of the United States also proposes to demand the discussion of the Drago Doctrine by the conference. That is the question whether it is legitimate to emply force to compel the States of South America to pay their debts. Drago, in the doctrine which bears his name, has sustained the negative. The United States reserves the right to put this problem before the Conference.

"It appears to me that the discussion of these matters, and especially the limitation of armaments, can under present circumstances have no practical result. That is why my Government has not put them in the program, and I have reason to believe that this opinion is shared by a great number of other Powers. Berlin thinks as we do on this subject. It is desirable in such a large assemblage as this not to consider any problems which cannot be settled. That of the limitation of armaments is of this kind, because the opposition of a single Power would be sufficient to prevent its settlement, and besides, whatever effort may be made to preserve its judicial character, it has essentially a political bearing.

"In any case, I insist upon this point—the Imperial Government of Russia does not consider that it has the right of excluding from the debates a question of this kind or any other. If it were otherwise, the reunion of the Conference would be quite compromised. All we demand is the avoidance of surprises and *coups*. My mission has for its object to remove this risk. We do not oppose even the discussion of problems which we consider actually insoluble, such as that of the limitation of armaments, but we desire that the countries which have the intention of engaging in these discussions should tell us exactly on what ground they place themselves, what are their views and what are their propositions, in order to insure the order and efficiency of the labors of the Conference. We have not spoken and we will not speak of the limitation of armaments, because we think that this interesting problem is not yet ripe, and because we know that some Powers, notably Germany, do not desire to take it up. We respect the right of either England or the United States or of any country to demand its inclusion in the subjects for discussion. We only insist on making definite the conditions under which this problem, not anticipated by Russia, shall be brought forward by others. France and Russia are now, as in 1899, absolutely in accord on these questions, in general and in detail."

Foreign Notes

The anti-clerical demonstration on the three hundred and seventh anniversary of the burning of Giordano Bruno by the Inquisition took place in Rome and other Italian cities on February 16th, but fortunately did not result in as much disorder as had been anticipated. A procession of 10,000 to 15,000 persons, with 20 bands of music and 120 flags, marched thru the streets of Rome and deposited 30 wreaths upon the Bruno monument. Afterward they went to the Capitol, drove the police from the loggia and planted there the red republican flag. Signor Ferri, one of the leaders of the Socialists in the Chamber of Deputies, addressed the crowd from this loggia, where Rienzi made the famous speech that aroused Rome.——The demand of Germany that Fehmi Pasha, Chief of the Secret Police of Constantinople, should be punished because he ordered the seizure of the cargo of a German steamship about to leave for Hamburg, was met by the usual Turkish policy of interminable correspondence and delay. Finally the German Ambassador presented an ultimatum to the Porte, demanding action within three days. This resulted in the immediate banishment of Fehmi Pasha to Mudania.——The primary elections for delegates to the Electoral College in Russia have nearly all been held and indicated that about two-thirds of the new Duma will be in opposition to the Government. The Constitutional Democrats will be the leading party. Mr. Vadovoseff, the radical leader, says that the first Duma was a Duma of anger, the second will be a Duma of vengeance. Alexis Aladyin, the leader of the peasants in the last Duma, is now in the United States, lecturing on Russian conditions and collecting money for the purpose of remedying them. He states that a million people are likely to die of starvation in Russia next spring.

The First Lobby for the People

BY J. O. HAMMITT

[The following article gives a full account of the activity of the Legislative Committee of the Citizens' Union during the past four years at the State Legislature at Albany. It is the pioneer work of its kind in this country and its remarkable success deserves the attention of all our reform organizations and good government clubs watching National, State or Municipal Legislatures. The author of this article is the Albany correspondent of the Brooklyn *Times*.—EDITOR.]

THE People's Lobby, maintained in Albany by the Citizens' Union of New York City, furnishes an object lesson for other States. This lobby was the first of its kind to be established, and its most interesting feature is success. Its growth and influence go to show what results can be accomplished by a small group of conscientious men. They have established a bureau as systematic and efficient as that of any railroad lobby in the Empire State. Every measure they have attacked in the four years during which the People's Lobby has been at work has failed of passage. Legislators whose records were unsavory owe and attribute their defeat, in some instances, mainly to the People's Lobby.

These accomplishments, the record of but four years of effort, make it well worth while to study the history and the methods used.

The idea originated from the work of a committee of lawyers in New York City who made a careful study of railroad legislation and discovered that some apparently slight amendments had been made almost annually, of which the public had heard nothing, and many of which were really of the greatest significance, tho their effect could not be readily seen by any but trained lawyers.

The Citizens' Union, an organization devoted to the betterment of municipal government, became at about this time much interested in legislation, because of the custom, which had grown to be very popular, of trying to govern the city from the State capital by special legislation. R. Fulton Cutting, the leader of the Citizens' Union movement, requested Julius Henry Cohen, one of the lawyers most interested in the transit movement, to take the chairmanship of a Committee on Legislation of the Citizens' Union. Mr. Cohen unfolded a plan for a People's Lobby which surprised Mr. Cutting. The latter, however, was convinced of the merits of the scheme, and Mr. Cohen was given *carte blanche* authority to organize his committee and the People's Lobby. This he did in time for active work at the session of 1904.

During the first two sessions—those of 1904 and 1905—a number of very bad bills affecting New York City were introduced in the Legislature. The corporations that wanted them used every method known to corporations to secure their passage. So important did it become to defeat these measures that the Citizens' Union and other civic organizations devoted to them all of their energy. Among them were railroad law amendments cleverly couched in general language, with the particular purpose of each so deeply hidden that it was safe from discovery by any person not an expert in the reading of "blind bills." The Committee on Legislation, thru its representative in Albany, was quickly apprised of the introduction of every one of these measures, and statements were given to the public press calling attention to the hidden purposes of the proposed amendments. Public opinion was aroused. Such organizations as the Citizens' Union, People's Institute, Board of Trade and Transportation, West Side Transit Reform Committee of One Hundred and the City Club organized opposition and held mass meetings. Hearings were demanded and the bills were beaten, the first check in years to the demands of New York City transit companies for legislative assistance. At another time a special train carried to Albany a delegation of five hundred organized by the Citizens' Union to protest against vicious tenement house amendments. Newspaper correspondents recorded in papers published in the home

JULIUS HENRY COHEN.
Chairman of the People's Lobby.

districts of Senators and Assemblymen their votes on the measures attacked, and fear of being defeated at the next election brought into line on the side of the people legislators who had been relied upon by the corporations in the years before the People's Lobby was established.

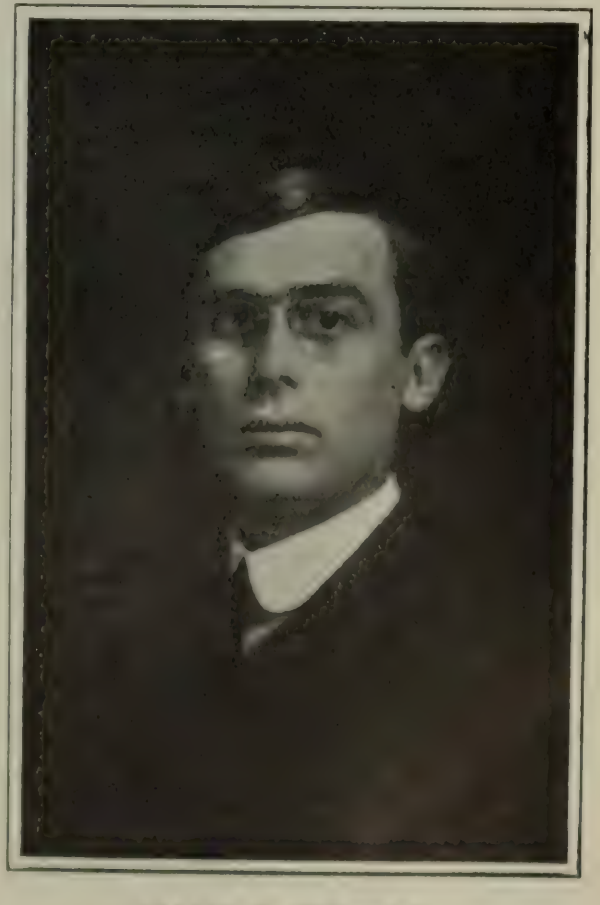
One of the tenement house amendments, to permit the operation of bake shops in non-fireproof tenements, was considered particularly dangerous, and it was thought the committee to which it had been referred would make a favorable report. An argument in its behalf was made by paid lawyers, and committeemen nodded their heads in approval. But before the hearing was over there arrived from New York City some of the early editions of the afternoon newspapers, with accounts of a fire started by fat boiling in a tenement, resulting in great loss of life. To hold up a copy of one of these newspapers, with its big headlines, was sufficient to prevent a favorable report on the bill.

Perhaps the best illustration of how the Citizens' Union's committee has detected and exposed the schemes of the corporation lobbyists is furnished by the fight over four separate amendments to the railroad law, intended to give to the Steinway tunnel corporation, which had probably forfeited its franchise rights, a complete, perpetual franchise. The four bills were introduced by four different Senators, and no one of them mentioned the name of the corporation which was most interested.

It is unnecessary to give the details of these bills, for they would require technical explanation. It is sufficient to say that they were of the utmost importance to the corporation, and secrecy was essential to their passage. Neither was it clear that the four bills had any relation to each other, till it was discovered by Travis H. Whitney, secretary of the Citizens' Union Legislative Committee.

Publicity killed these four measures, as it killed the others. Their defeat was probably the most notable accomplishment of the kind to the credit of the People's Lobby.

The machinery by which the People's Lobby works is not elaborate, but every part fits into a necessary place, and every part is for work and not for ornament. In New York City is the headquarters of the Citizens' Union Committee on Legislation, composed almost entirely of lawyers—fifteen in number. In Albany is the headquarters of Mr. Whitney, the secretary, who has a sufficient staff of assistants and is registered in the office of the Secretary of State as a legislative agent. Mr. Whitney's entire time during the session is devoted to the People's Lobby. It is no amateur work he does, but requires his attention as fully as any railroad corporation demands the attention of its paid agent at a State capital.



Mr. Whitney watches every step in the progress of every bill of interest to New York City, from its introduction to its defeat or its passage and the signing of it by the Mayor and the Governor. As soon as a bill is printed a copy is sent to the member of the Committee on Legislation who is assigned to the study of measures of its class. Thus, one man looks after ballot and election bills, another after code amendments, another follows the constructive amendments to the railroad law, still another studies the special and private amendments to the railroad law, another, other public ser-

vice bills, another, tax bills, another, police bills, another, civil service bills. The classification is complete and workable.

By this system, each member of the committee becomes a specialist in the particular line of work assigned to him. He receives weekly from the secretary of the committee, who is always on the ground at Albany, the bills which it is his business to examine, and a blank form for a report. This blank requests him to notice how the New York City charter, and the rights and powers (including discretionary powers) of New York City are affected, and to report of what should be the attitude of the Committee on Legislation. If the bill is one on which the committee should take action, favorable or unfavorable, the specialist is to report on the scope of the bill, its effect, and the changes it would make in existing law. If it is an important measure, he is to brief the points of objection or approval. These reports are all filed in such manner that when reference is made to them it can be readily seen when, where and by whom the bill was introduced, the subject to which it relates, by whom it was examined for the committee, when considered by the committee as a whole, and how acted upon. The reports are received by the secretary in time to make up a calendar for discussion at the regular meetings of the committee held every Friday night.

Power is freely voted to the secretary to take immediate action on any unusually pernicious legislation, and this is in practice one of the most effective features of the work done by the People's Lobby. The secretary maintains the best equipped publicity bureau in Albany. He has available for every newspaper correspondent an accurate statement of the provisions of every bill introduced, within an hour after its introduction. These statements, or abstracts of bills, are relied upon by the newspaper men, because they have found them always truthful and unbiased. They furnish for the aid of the People's Lobby a vehicle of publicity which is more powerful than any other weapon in the hands of any lobby in Albany. So-called "blind" bills, which formerly slipped thru the Legislature unnoticed, are almost sure to be immediately detected by the expert of the People's Lobby and the schemes they are intended to further are exposed in the newspapers the very day they are introduced.

At the close of the sessions of 1905 and 1906 the Committee on Legislation published a report, which will appear annually hereafter, including as one of its features a complete record of all the bills introduced by senators and assemblymen from New York City and a brief estimate of the record of each man, with a recommendation as to whether he should be reelected or defeated. These reports on individual members are expressed in the shortest possible phrases, and with a clearness which is quite remarkable. For example. of one senator it said "Has great parliamentary and legislative ability, which he has used for the most part against the public interest; opposed the insurance bills at all stages; entitled to credit for his hard fight for mortgage tax repeal." Of another "Inactive, inefficient, inattentive; should not be reelected." It can and does praise good work as well. Of an Assemblyman it said: "Industrious and intelligent; did effective work on floor and in committee; services especially valuable in legislation

TRAVIS H. WHITNEY.
Secretary of the People's Lobby.

affecting New York City, particularly in Rules Committee which has complete control during last ten days; emphatically deserves re-election."

The independent voters in New York City have already learned to heed this report. Candidates whose re-election was recommended spread it broadcast thru their districts in the campaign last fall. Opponents of legislators whose defeat was urged by the People's Lobby made great capital of the report. In some districts the effect was particularly noticeable. One Senator condemned by the People's Lobby, ran eight thousand votes behind his ticket in a Brooklyn district and failed of re-election. Another who failed of renomination said to the secretary of the Citizens' Union Committee on Legislation, on meeting him afterwards in Albany: "I'm not here this year, and you're to blame. When I asked for a renomination I was told I couldn't have it because the Citizens' Union disapproved of me. But it's all right. You were quite accurate about me."

It is quite natural that plans should be made to extend a People's Lobby which has met with such marked success. A number of prominent men will be called together in Albany shortly to organize a league whose purpose will be to watch legislation for the entire Empire State as it is now being watched by the People's Lobby for the City of New York.

ALBANY, N. Y.

Henry Wadsworth Longfellow

(Born February 27th, 1807)

BY JOEL BENTON

MASTER of stateliest measures, linked to the home and the heart,
Filled with the tenderest meanings—molded by consummate art—
That soothe like the patter of rainfalls, which sweeten the earth and the air,
Or the lisp of the leaves of the forest, when the sky and the landscape are fair.

Today, not a singer among us can capture his sweetness of strain,
But echoes of fancy and flourish are proffered again and again,
Which are merely poetic gymnastics of which we are sated, and tire;
But never a note from the music that made so appealing his lyre.

The love of pure woman—the human endeavor for duty and joy,
The things that enrapture the children, the plays of the girl and the boy,
How hallowed they were in his vision, how pulsing with pathos their thrill;
But now there is none to invoke them, for the lips of the singer are still.

The Indian, the Blacksmith, Excelsior, Tales of the Sudbury Inn,
But to name half the themes of our Poet no writer can more than begin;
The wonders of Dante, Sandalphon, the birds robbed of welcome and place,
What beauty they had of description, what effluent sweetness and grace.

No poet was ever more gentle, no spirit of letters so rare;
The words that he uttered were chrismic; they smoothed off the wrinkles of care.
He sang of life's blessings and troubles, of summer, of sadness and love,
And strewed on our path tinted rainbows that reach to the mansions above.

AMENIA, N. Y.

Vicomte Georges D'Avenel

Vicomte Georges d'Avenel, who begins a course of lectures on the Economic History of France at Harvard University on the 27th of this month, occupies a unique position among French historians. He has attempted to blend sociology with history and has succeeded admirably in doing so. He has devoted himself for many years to a study and exposition of the social conditions of France from the year 1200 up to the present. He has compiled tables of the prices of the commonest objects, of salaries and incomes and by comparing these figures has arrived at conclusions of the most suggestive nature. "M. d'Avenel," said the late Albert Sorel, himself an eminent historian, "does not pretend to formulate inflexible laws. He wisely limits himself to collating all the individual facts which resemble each other, to grouping them, and comparing them with certain well-established facts of a more general nature. He does not permit himself to do more than extract from his studies a few judgments upon the past and a few opinions regarding the present. If history is to become a science like the natural sciences, it must follow this route." The productions of M. d'Avenel which illustrate his method best are a four-volume "History of Property, Salaries, Commodities and Prices"; "Peasants and Laborers for the Last Seven Hundred Years"; "Private Fortunes During Seven Centuries"; "The French Nobility Under Richelieu," and a five-volume exposition of contemporary life entitled "The Mechanism of Modern Life." M. d'Avenel is also the author of a two-volume history of the Bishops and Archbishops of Paris, and of a four-volume work upon Richelieu and the Absolute Monarchy, both of which antedate the full development of his special method; of a volume entitled "Administrative Reform," in which he applied the conclusions of his researches to the administrative conditions existing in France in the early nineties, and of a social satire, "The French of My Time," an exceedingly clever book, which may be regarded as a recreation from his severer studies.

ALVAN F. SANBORN.

The Youth of Longfellow

BY THOMAS WENTWORTH HIGGINSON

[Next week Wednesday will be celebrated thruout the land the centenary of the birth of Longfellow. We are accordingly very glad to be able to present to our readers the following article by his close friend, Colonel Higginson, and to reprint an original poem of Longfellow in facsimile which appeared in THE INDEPENDENT after the assassination of Garfield, and our accompanying editorial.—EDITOR.]

LONGFELLOW,
Taken just after he left College.

The year 1836, when the young Professor Longfellow first entered on his duties at Harvard College, was about the time when the ancestral ways and traditions, so deliciously described by John Holmes in his "Harvard Square," were finally taking farewell. The ruffles, the cue, the small clothes, the bewigged or powdered head, the cocked hat, had almost disappeared from view. Professor Sales alone wore a cue and still availed himself in moments of enthusiasm of his stentorian oath, "Ha! ha! By Jorge!" Professor Popkin still wore the last of the cocked hats, the very one which is faithfully preserved in the Cambridge Public Library; and he still turned on the irreverent passer-by who designated him by his accustomed nickname, met now by the angry protest, "Who is that impudent fellow who dares to call me Old Pop? He is not a Harvard student!" But these were the last representatives of the old tradition. Exit the Revolutionary period and enter youth and Longfellow.

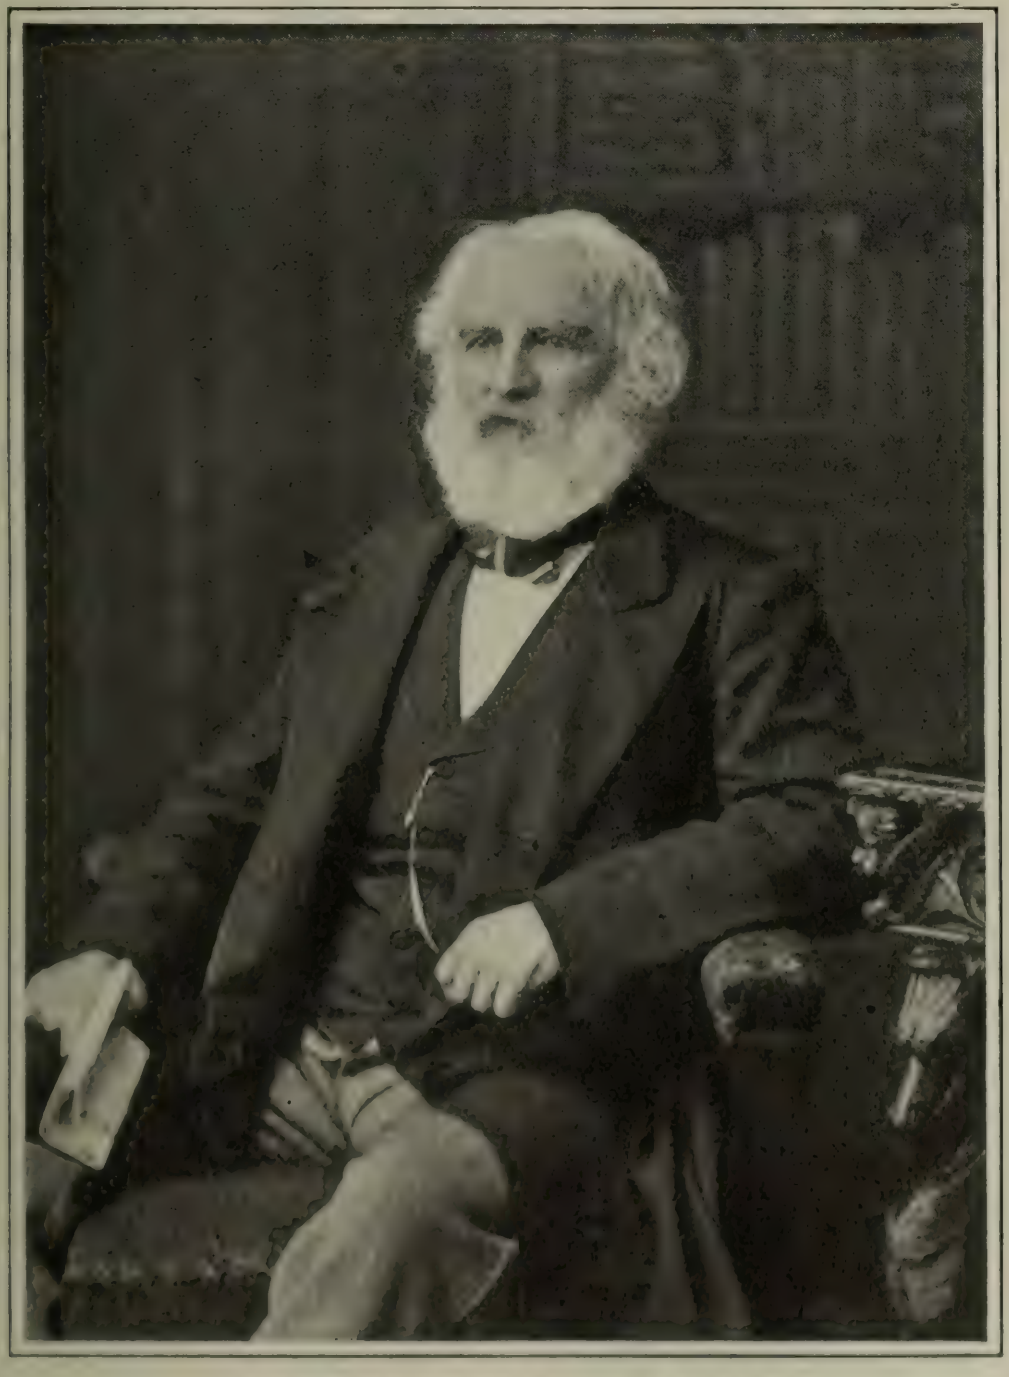
Professor Longfellow when he first took up his abode in Cambridge at the age of twenty-nine bore still less the aspect worn by a Harvard student in those modest days. Mrs. Craigie, his first hostess, thought he had "somewhat too gay a look" and had "a fondness for colors in coats, waistcoats and neckties." He wrote to his friend, Sumner, who was still lingering in Europe: "If you have any tendency to curl your hair and wear gloves, like Edgar in 'Lear,' do it before your return." The simple fact was that the time had come after bereavement, study and wandering, for reuniting himself with the world and letting his larger aims take their course.

It is not often that a poet's successive steps in literary development were marked so definitely during the formative period of life as was the case with Longfellow. He wrote to his father, during his last year in college (1825):

"I most eagerly aspire after future eminence in literature; my whole soul burns ardently for it, and every earthly thought centers in it. There may be something visionary in *this*, but I flatter myself that I have prudence enough to keep my enthusiasm from defeating its own object by too great haste. . . . Let me reside one year at Cambridge. Let me study *belles lettres*, and after that time it will not require a spirit of prophecy to predict with some degree of certainty what kind of a figure I could make in the literary world."

The next landmark lies in that touching description by his friend, George Washington Greene (1836), in dedicating a book to the poet, of the day spent by the two young men in Naples when they compared notes as to their plans of life:

"We talked and mused by turns, till the twilight deepened and the stars came forth. . . . It was then that you unfolded to me your plans of life and showed me from what deep cisterns you had already learned to draw. From that day the office of literature took a new place in my thoughts."



Three years later brought a partial reaction, and he wrote to his father: "My poetic career is finished. Since I left America I have hardly put two lines together." It was in prose that his travels showed their outcome. But within that very year came the period of reaction. We now know that the whole impulse of "Voices of the Night" came suddenly. He writes in his diary (September 11th, 1839): "I have taken to the Greek poets again, and mean to devote one hour every morning to them. Began today with

Anacreon. What exquisite language! Why did I ever forget my Greek?" And the next day he writes: "I mean to publish a volume of poems under the title of 'Voices of the Night,'" and it is to be noticed that for once in his life he borrows a motto and perhaps the title itself, quoting also those beautiful lines from the Orestes of Euripides beginning

Πότνια, πότνια νὺξ
ὑπνοδότειρα τῶν πολυπόνων βροτων.

It is true that a few days later he novel, a series of sketches and only one poem—possibly a translation. But, no matter, the current of his life was determined, and he was to be in form as well as in feeling, a poet.

How far was all this new ambition from the juvenile period, when he imagined New England villagers dancing by the greenwood tree on a Maine farm, or converts the plain Moravian sisters into nuns, singing hymns among cowled heads in dim, mysterious aisles! Yet he

HENRY WADSWORTH LONGFELLOW AT 65.

sketched out a plan of proposed works, including a history of English poetry, a reprinted those very poems; poets rarely fail to do that, for their early admirers

would be indignant. Fortunate is it indeed that poets so often unintentionally preserve for us some samples of their early crudeness as well as some better executed work of their maturity.

Longfellow himself reacted from this exaggeration so far that he was often afterward reproached for a simplicity which was really at the basis of his power. Sometimes still keener criticisms were made. Lord Coleridge wrote to Ellis Yarnell, complaining that Whittier's poems were not "put together with deft plagiarism, like Longfellow," ignoring the fact that simplicity itself often seems like plagiarism from others who also use common words. Longfellow was dealing with those who erred in the other direction. He wrote in the *North American Review,* criticising those "writers turgid and extravagant" who were to be found in American literature, as, for instance, Chivers. "Is not he who thus apostrophizes the clouds, 'Ye posters of the wakeless air,' quite as extravagant as the Spanish poet who calls a star 'a burning doubloon of the celestial bank'?" Yet Chivers was simply a friend and imitator of Poe, and wrote "Eonchs of Ruby," closing with all seriousness, in the Poesque dialect:

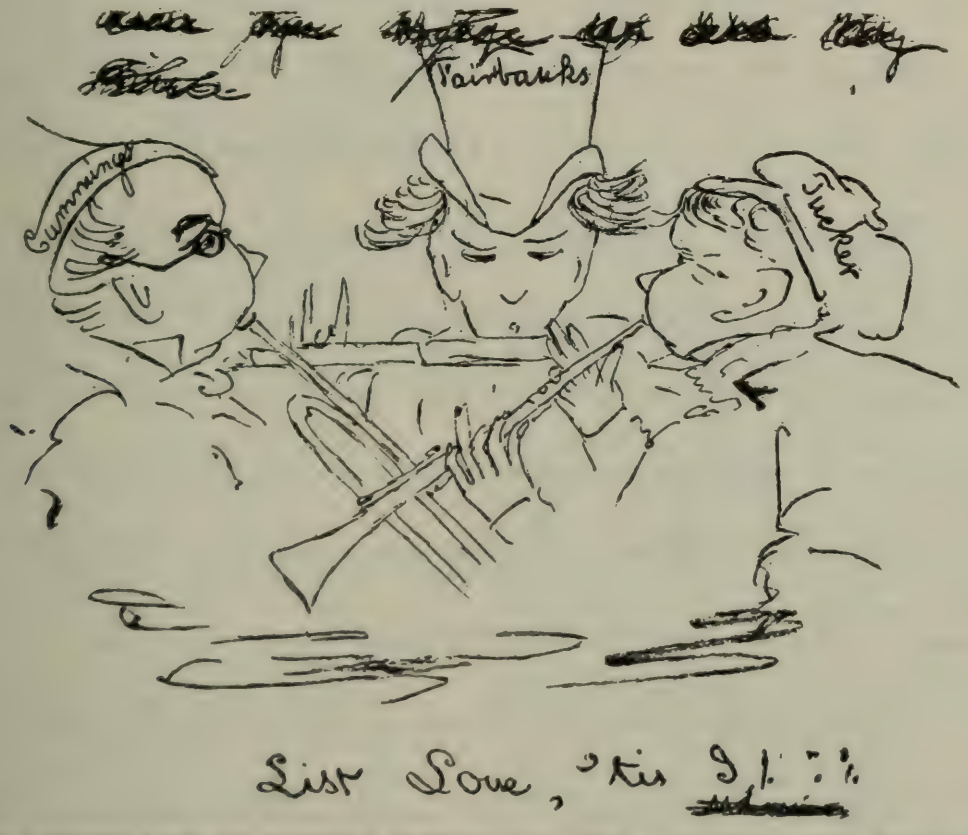
"Where the groves by the Ouphantic Fairies,
Lit up for my Lily Adair,
For my child-like Lily Adair,
For my heaven-born Lily Adair,
For my beautiful, dutiful, Lily Adair."

It certainly was a blessing to American literature that Longfellow erred, if he did err, on the side of simplicity, when even the prose writers, such as Brockden Brown, the novelist, and even George Bancroft, the historian, tended to the florid, a course which is indeed apt to be the first impulse of writers in a new country. Even Lowell wavered sometimes under Poe's influence, but Longfellow never did.

But it cannot be denied that this extreme simplicity had danger in another direction. Longfellow's translations had scarcely a defect, as all agree; but when he wrote from his own reveries alone we sometimes miss that fresh and vigorous handling of outdoor nature which is so marked in Browning, Tennyson and Lowell. It has never yet been settled by botanists precisely what wild flowers he meant by "bishops' caps," and there is a vast difference between Longfellow's gentle and somewhat vague description,

"Gaze into the summer sky
Where the sailing clouds went by
Like ships upon the sea."

and the trenchant strokes of Browning's picture of Ætna (in "Sordello"):



"Towards him tilting cloudlets prest
Like Persian ships at Salamis."

It must also be conceded that much of this indifference as to minute accuracy is manifested in the treatment of historic and even geographic details by Longfellow. Criticisms on this point have long and freely been lavished on some of his most popular works, as "Evangeline," "Paul Revere's Ride," "The Courtship of Miles Standish," "The Rhyme of Sir Christopher [Gardiner]," and, indeed, the "Tales of a Wayside Inn" generally. Yet, after all, it is generally recognized that the most rigid mathematical or geological precision is not always to be demanded of a poet, who must rather trust to the rule laid down by Habakkuk (ii. 2): "Write the vision and make it plain, upon tables, that he may run that readeth it." Tried by this standard, Longfellow is safe.

Longfellow wrote in his diary, "We have but one life here on earth; we must make that beautiful. And to do this health and elasticity of mind are needful; and whatever endangers or impedes these must be avoided." Rarely is a man's scheme of life so well fulfilled. In Lord Ronald Gower's "My Reminiscences" he says "If asked to describe Longfellow's appearance I should compare him to the ideal representations of early Christian saints and prophets. There is a halo of goodness about him, a benignity in his expression which one associates with St. John at Patmos saying to his followers and brethren 'Little children, love one another.' . . . It would be presumptuous for me and out of place to do more here than allude to the universal popularity of Longfellow's works. Whenever English is spoken, I believe it is not an exaggeration to say that his works are more popular than those of any other living poet." So Holmes wrote of him, after his death: "His life was so exceptionally sweet and musical that any voice of praise sounds

more like a discord after it." Lowell, at Westminster Abbey, said of him: "Never have I known a more beautiful character. . . . His nature was consecrated ground, into which no unclean spirit could ever enter."

There was, however, a certain limitation in his temperament which is best stated by that keen critic, the late Mr. Horace E. Scudder, who says of Longfellow, "He gave of himself freely to his intimate friends, but he dwelt, nevertheless, in a charmed circle, beyond the lines of which men could not penetrate. . . . It is rare that one in our time has been the center of so much admiration and still rarer that one has preserved in the midst of it all an integrity of nature which never abdicates." This touches the point which his greatest intimates were apt to overlook. Every one came freely within the circle of his courtesy, but the inner circle of intimacy few, if anybody, attained. Even in conversation, he was reticent, not exuberant. At the dinner parties of his circle, it was Lowell and Holmes who did nine-tenths of the talking, while Longfellow, like Whittier, was silent in comparison. Going to consult him occasionally at his own house in later years, I met with inexhaustible kindness and good counsel and commonly with too easy praise, and I never came away quite disappointed, yet sometimes half disappointed as if, after all, I had not quite got inside the "charmed circle of his mind." John Dwight, the chief musical critic of Boston, used to say to me that no one did so much harm to the cause of music as Longfellow, because he praised every musician who applied to him for endorsement. Yet "even his failings leaned to virtue's side." I remember how he appealed to me repeatedly and successfully to insert a certain general officer's name in my "Young Folks' History of the United States," putting it on the plaintive ground that this officer's son had felt badly at the original omission; and I afterwards learned how he, himself, had labored thru the long series of "Poems of Places" mainly to furnish employment for an impecunious friend.

SKETCH BY LONGFELLOW OF YOUTHS SERENADING MRS. LONGFELLOW'S YOUNGER SISTER.

CAMBRIDGE, MASS.

President Garfield.

"E venni dal martirio a questa pace."

These words the Poet heard in Paradise,
Uttered by one, who bravely dying here,
In the true faith, was living in that sphere,
Where the Celestial Cross of sacrifice
Spread its protecting arms athwart the skies;
And Sol, thereon, like jewels crystal clear,
The souls magnanimous, that know not fear,
Flashed their effulgence on his dazzled eyes.
Ah me! how dark the discipline of pain,
Were not the suffering followed by the sense
Of infinite rest and infinite release!
This is our consolation; and again
A good soul, cries to us in our suspense
"I came from martyrdom unto this peace!"

Henry W. Longfellow.

Sept. 26, 1881.

"Dal Martirio a Questa Pace"

[From an editorial in THE INDEPENDENT of October 6th, 1881.]

THE delicious sonnet which Mr. Longfellow contributes this week to our columns, will sing itself into the reader's heart by its own sufficient sweetness; but it will grow brighter, sweeter, and more tenderly pertinent to the theme when read, as the poet evidently designs it shall be, in the light of its allusions to the poem of Dante, from which the theme is taken and which he himself rendered into English verse. The line quoted is the last in canto XV of the "Paradiso," and we need hardly say that Mr. Longfellow quotes from his own version the last line of the sonnet.

Our readers will pardon us for recalling to their minds that in the previous cantos, Dante had ascended to the fourth heaven, or the sun, where he beheld himself encompassed by a wreath of glorified spirits. From the flashing glory one of them, St. Thomas Aquinas, the Doctor Angelicus of the medieval theology, speaks:

> "Aquinas, am I hight,
> And would'st thou know the names of all the rest?
> Turn thou thine eyes as I direct thy view,
> Look up thruout the garland of the blest."

Doing this, he beheld the

> "fifteen stars, selected out
> Of Heaven's expanse, so vivid as to chase
> All gloom away."

And

> "the opening of that horn
> Which springs uprising from the very pole,
> Round which the *Primum mobile* is borne."

He saw Ariadne, her garland changed by Bacchus to a wreath of stars.

> "Earthly beauty is exceeded there."
> "No pean there, no Bacchus song they raise."

Borne upward again in higher flight, so still and swift as to annihilate the sense of motion and leave only the perception of a new arrival, like the experience of a breaking dawn, the poet finds himself in the planet Mars, and beheld above him,

> "Spangled thickly in Mars' orb profound,
> . . . that venerable sign displayed,
> Formed by diameters within a round,"

the cross in a circle, which is the ancient symbol of the Christian's holy warfare. Here studded into a glorious cross Dante saw the forms of warriors, martyrs, heroes, and great, struggling, suffering Christian souls. In the medieval mode of viewing things like these, the distinction between the symbol and the object, between Christ and the cross, disappeared. There was an epic on the cross, in which that sacred wood was treated as a living thing and hero, and this is no violent conception when once we have overcome the disdinction between the symbol and the object. So Dante calls the cross he saw, Christ. In these immortal forms, gathered in the resplendent cross that shown above him, Christ he saw beaming in the glory given to his saints, while through the cross ran a "gathering melody" which ravished him and seemed to cry to the heroic constellation, in words said to have been taken from an ancient hymn (though, as Mr. Longfellow remarks, from what hymn no one seems to know):

> "Rise again and victor be."

This is the

> "Celestial cross of sacrifice,"

of which Mr. Longfellow sings, which

> "Spread its protecting arms athwart the skies;
> And, set thereon, like jewels crystal clear,
> The souls magnanimous, that knew not fear,
> Flashed their effulgence on his dazzled eyes."

Among these resplendent spirits Dante saw his own ancestor, Cacciaguida, of whom nothing more is known than what appears in this canto of the "Paradiso," that he followed the Emperor Conrad to his crusade, was knighted and belted for his bravery, and there, where he won his glory, lost his life. Cacciaguida is the speaker in Mr. Longfellow's ode. In the "Paradiso" he glides down to the foot of the shining cross and there talks with Dante. He speaks of the grand consolation that for him has followed earthly pain. Mr. Longfellow employs this thought beautifully and with a master's hand to serve the purpose of his sonnet, and throws it out like a banner in the triumphant lines:

> "This is *our* consolation; and *again*
> A great soul cries to us in our suspense!
> 'I came from martyrdom into this peace.'"

Beautiful, too, are the unspoken allusions of this citation and their pertinence to the use made of them; for Cacciaguida says that he, too, fell when trying to set up law and bring in a better order, and that he fell the victim of a distant, subtle, scheming power, whose policy and interest held back the righteous cause he battled for. He tells also of the simple state from which he came, and describes Florence as no mean counterpart of that yet simpler life amid which our President grew up.

> "Bellincion Berti saw I go begirt
> With leather and with bone, and from the mirror
> His dame depart without a painted face.
>
> And him of Moli I saw, and him of Vecchio
> Contented with their simple suits of buff
> And with the spindle and the flax their dames."

It may not be out of place to add that Lombardi has this note in his edition of Dante, expressing a pertinent thought, which may bring these observations to a close—"*Dal martirio. Martyrem non facit poena, sed causa*,"—for we shall lose the ethical import and the great significance of this tragic history if we do not bear in mind that it was the cause, and not the suffering, the moral meaning of his life and not the bare fact of his death, that made our President a martyr.

Pragmatism

BY EDWIN E. SLOSSON

"WHERE is the fire?" yelled the irreverent undergraduate from the windows of the chemical laboratory on the fourth floor to the crowd hurrying across the campus of Columbia University last week.

"Shut up," shouted his biological colleague from the opposite building. "Don't you see the bank's busting and they are making a run on it?"

Their deductions were erroneous, but natural. They might have guessed again, and several times, before they would have hit upon the right explanation, that the men and women who were packed like dates into Columbia's largest classroom and filled the corridor and extended in a cue out into the snow, were drawn there by the announcement of a course of lectures on philosophy; on the nature of reality, the validity of truth, the theory of cognition, and the like.

"Never mind," said one compressed personality to his near neighbor, "I've seen these popular lecture courses before. Tomorrow there will be plenty of room, and by the end of the week there will not be more than a dozen."

By the end of the week the crowd was three times as great, filling the large hall to which the course had been transferred, and by the end of the second week there was standing room only in the gallery. Of course, the people came out at first to see Professor James rather than because they were interested in his pragmatic philosophy. That could be told by listening to the remarks of the assembling audience. All over the room people could be heard repeating to their neighbor one of the most pertinent of last century's epigrams: "You understand, this is William James, not Henry. He is the psychologist that writes like a novelist, not the——" "Yes, I know," invariably interposed the friend.

But they were not so well informed as to the nature of pragmatism as on the distinction between the complemental brothers. "I don't know much about it, but I think it has something to do with the Austrian succession," was the reply most to be heard at the opening session. Dr. Schiller says that the new humanism appeals most to the young, the strong and the virile. That is probably true, but in Professor James's audiences the old, the anemic and the feminine elements were also well represented, and proved quite as susceptible as their opposites to the contagion of the new ideas.

Certainly Professor James is justified in saying that pragmatism is not so much a new system of philosophy as it is a spiritual tendency, a movement like democracy in politics, romanticism in literature and evolution in science. It shows the same power as these causes had in their day to arouse everywhere ardent championship and furious opposition. In Florence a group of young Italians have formed a Pragmatist Club and established a journal, *Leonardo*. The teachers who came under Professor Dewey's influence in the University of Chicago are spreading the pragmatic spirit thruout the West. In Oxford F. C. S. Schiller is undauntedly sounding his trumpet against the walls of the Jericho of scholastic philosophy. Professor James has resigned his chair at Harvard in order to devote himself to the propaganda of pragmatism. Professor Ostwald resigned the chair of chemistry at Leipzig for much the same purpose, believing that science now does

not need more facts so much as it does a new *Naturphilosophie* to correlate the facts already accumulated.

It is worthy of note that new humanism did not owe its origin to the study of the "humanities." It is the gift of modern science to metaphysics and ethics. The ideas that are now shocking the cloistered classrooms of philosophy have been for many years as commonplace in the laboratory as test tubes and galvanometers. But scientific men did not take the trouble to formulate their method. They were too busy using it to stop to look at it. They were so pragmatic that they did not know they were pragmatists. It was Wilhelm Ostwald who first saw the philosophical significance and scope of the method of research used in modern science, a method altogether different from—indeed, almost opposite to—the Baconian method, which, nevertheless, is still referred to by literary men as the foundation of modern science.

The layman—and with him must be included all those who have merely learned science but not used it—talks a great deal about "the laws of Nature," which he regards as abstract, immutable, universal and eternal edicts, part of which are transcribed into the text-books. To the working scientists they are only more or less convenient formulas; in the ultimate analysis mere mnemonic symbols, like *vibgyor,* for stringing together facts to make them easier to handle. He knows most of them are limited in their scope and only approximate in their accuracy. His chief delight is in discovering these limitations and irregularities. He regards these "laws" with no awe or reverence. He has no attachment for any of them unless it happens to be one that he has formulated himself. If he finds a new hypothesis that works better he throws the old one aside as he does his old model dynamo, or keeps it around as handy still for doing some of the common work of the laboratory. Theories to the scientist are neither true nor false. They are only more or less useful. He neither believes nor disbelieves them; he only uses them. It is, for example, just as "true," using the word in its ordinary sense, to say that the sun goes around the earth as to say that the earth goes around the sun, for all motion is relative, and we can regard either body as the stationary one or both as moving as we choose. When we say that the statement that the earth moves around the sun is the "true" one, we merely mean that it is the more convenient form of expression, for on this hypothesis the paths of the earth and the other planets become circles (or more accurately speaking, irregular and eccentric spirals) while on the other and older hypothesis their paths are very complicated and difficult to handle mathematically. The theory that the earth moves is not only simpler than that of a stationary earth, but it is wider in its scope. It explains more, that is, it connects up with other knowledge, such as the flattening at the poles. Copernicus, then, did not discover a new fact about the solar system. He only invented a lazier way of thinking about it.

The man of science invents an hypothesis whenever he needs one in his business. It is to him merely a new tool, a *novum organum.* If there is not an ether it would be necessary to create one. So he did it. He had to have a nominative for the verb "to undulate." When he had created it he saw it was not good. The properties with which he endowed it were self-contradictory, and it refused either to move with the earth or to pass thru it. But these theoretical inconsistences do not bother the physicist much. In spite of them the ether is a handy thing to have about the laboratory. The scientist does not abandon a theory because it has inconsistences any more than he divorces his wife because she has inconsistencies. Certainly the physicist did not consider himself presumptuous in thus creating ether for his own convenience. He knew that the ordinary man had in the same way invented matter long ago for his own convenience. It is a crude, inadequate and impossible idea, this naive conception of matter as something solid, heavy, hard, inert, indestructible, impenetrable, colored and surfaced; but it is good enough for part of the people all of the time and for all of the people part of the time. The physicist himself uses it for everyday. Only in his rigorous moments does he come down to bed rock and say with Poincaré, "Mass is a coefficient which it is convenient to introduce into calculations."

But when the physicist thus reduces matter to a small italic *m* some people are sure to say that he is denying the existence of matter. What would they say about Riemann who considers matter to be holes in the ether? A definition is a different thing from a denial. There are people among us who deny the existence of matter and they call themselves "Scientists," too, but they are not the ones who are devoting their days and nights to the study of the workings of matter in order to make it the servant of man.

A professor of chemistry would not think of asking his students if the atomic theory is true any more than he would ask them if the atomic theory is blue. He does not care whether they believe the atomic theory or not. He only wants them to be able to use the atomic theory for getting certain valuable results. Consequently he watches with interest and without apprehension the progress of discovery in radio-activity which is undermining the old conception of the atom. He would be glad to get rid of the atomic theory if he could find something better because after all it is a clumsy thing and will not hold half the facts he wants to put into it. He would have no more hesitation about dropping it than he has in setting down one beaker to pick up a larger one when what he has in the first is frothing over. He does not want to spill anything, but he does not care what vessel it is in. Revolutions in science never go backwards and they differ from political revolutions in that nothing worth saving is lost in transition. The new theory must always include all that the old one does and more. In their struggle for existence, formulas fight like snakes; the one that can swallow the other beats.

So long as this conception of the nature of truth was confined to the physical laboratory nobody was alarmed, but now that it is invading the field of metaphysics it is causing a commotion. But the present stir is nothing in comparison with what will happen when this revolutionary idea begins to be applied thoroly to ethics and religion, to sociology and politics, to history and education, as it is likely to be in the next ten years. The fight over Darwinism will be to this as a kindergarten game to college football. It will be worth living to see.

The battles of theology and philosophy in the past have been fought with weapons of limited scope, like the sword and spear. The pragmatic method is like the invention of gunpowder. This new controversial weapon carries further and can be used by anybody. That is the danger of it. In careless hands it may lead to intellectual anarchy, to gross superstition or to blankest atheism. Properly used, it may be the cause of as great progress in individual and social ethics as it has accomplished in physical science.

In any case it will not be a purely ornamental theory, like so many we keep on our mental mantelpieces. The essence of pragmatism is action. It values ideas by their consequences. Those that have no consequences it casts out of consideration. Peirce, in his original statement of the pragmatic method, lays down this rule, as given by James:

"If it can make no practical difference which of two statements is true, then they are really one statement in two verbal forms; if it can make no practical difference whether a given statement be true or false then the statement has no real meaning."

The reader will discover for himself the solvent action of this principle if he will apply it to any of the old antinomies, such as materialism-idealism, fate-free will, objective-subjective, monism-pluralism. If he wants to experiment further with the pragmatic method, let him test some of his beliefs with Professor James's formula:

"The only meaning of truth is the possibility of verification by experience."

Or this:

"True is a term applied to whatever it is practically profitable to believe."

When the phrase "the survival of the fittest" first came into the world it was objected to on opposite grounds. Some said it was a truism—too obvious to need mentioning and leading to nothing. Others said it was false, absurd and dangerous doctrine, destructive of all morality if followed to its logical conclusions. It is interesting to note that pragmatism is now being met by both these objections. If it is new it is nonsense; if it is old it is obvious. Between these extreme opponents there is the *tertium*

quid, a more numerous and cautious party, which virtually says, "Well, if I admit that, what are you going to prove by it?" The pragmatist, as one who believes in testing a theory by its consequences, cannot find fault with this attitude. But apparently one cause of the caution with which the new philosophy is viewed is that two of its leading advocates, James and Schiller, are suspected of being too fond of spirits, disembodied ones, from their connection with the Society for Psychical Research. Does the acceptance of pragmatism carry with it the acceptance of Mrs. Piper? Will we not find out too late that we have admitted a wooden horse full of spooks? If we use the pragmatic method to bolster up our belief in personal immortality, will it not bring in its train the saints, the angels and the whole host of devils which have been expelled from our theology? And in that case will not our last state be worse than the first?

Dewey's test of truth is its satisfactoriness, its competency to give adequate satisfaction to all legitimate human needs and aspirations. The opponents of pragmatism interpret this to mean that we can believe whatever we please, a denial of the imperativeness of truth and duty. Dr. Francis Patton of Princeton says it means that "religion is any old thing that works." Carried to an extreme in this direction it would lead to unlimited individualism in philosophy and anarchy in ethics, to Max Stirner's "My truth is the truth." But the pragmatists check the drift in this direction by the observation that our life philosophy must be permanently satisfactory, not the caprice of a momentary mood; it must be satisfactory to the race as well as to the individual; it must not conflict with any of our other ideas; it must harmonize with whatever we credit in the philosophies of other people; it must connect up with all we know of the past and with all we can foretell of the future. Peirce bases his pragmatism on the subordination of individual to collective thought. Carried to an extreme in this direction, it would lead to religions of authority and conformity. But the pragmatist is never an extremist. He always refuses to swim out of his depth in the sea of speculation.

It is too early to tell whither the pragmatic movement will lead. It is hardly to be defined yet as a philosophic system, or even as a school of thought. It is rather the future focus of several very diverse but converging lines of thought. It already has its schism; literally, pragmaticism, a narrower term which Peirce has recently devised because his original word, pragmatism, got carried away from him by the sweep of the movement. Schiller in England prefers a still wider term, humanism. Dewey refuses to wear any tag. Santayana's recently published "Life of Reason" is officially declared by its publishers to be of a pragmatic character. H. G. Wells, in his addresses, "The Discovery of the Future" and "The Imperfections of the Instrument," attacks the legal-minded man in a distinctly pragmatic way. Ostwald in Germany and Poincaré in France are developing the new philosophy on its scientific side. In so far as these tendencies can be summed up in a phrase they may be said to be leading toward a utilitarian metaphysics.

New York City.

Superwoman

BY MRS. L. H. HARRIS

[Ever since Nietzsche startled the world with the idea that there will be in the future an *Uebermensch* who will stand in the same relation to us as we do to the apes, many writers have busied themselves with speculations as to what sort of a creature this Superman will, or ought to be. They have differed so widely in their definitions that there is room for this new suggestion of Mrs. Harris's.—EDITOR.]

WHY is it that nothing is ever said or written about the superwoman? Is she inconceivable, or has she been excluded from the current thought by the superman's consciousness? We hear more than enough about the latter, considering his rudimentary state. Everybody, from Bernard Shaw, who is himself one of the missing links between moral idiocy and degraded egotism, to the Russian mystics, have been trying to portray him—that is, everybody except the women. For, however, man may appear to man, no woman with a sense of proportion, or even a sense of humor, would at this stage of his development prefix such an hyperbole to the inevitable old Adam in him. But, over and above this tittering female silence comes the male chorus of the superman with ever increasing volume. Galton thinks that he may be produced by some kind of breeding process, just as in the course of enough time we may tease nature into hatching out a terrapin with wings. Dr. Slosson, after reading Merejkowski, sees him even more clearly and defines him as the "arch-egotist-altruist"; that is to say, he is a paradoxical phenomenon uniting all the assurance in the world with the chief virtue in heaven.

Now it is certain that since the creation of the first woman, man has been arch-man, and that this led easily and naturally to his becoming the arch-egotist is equally certain; but to claim that he is also an altruist is to claim for him a master's degree in ethics to which he is not entitled. No man is an altruist except in the limited sense of bestowing all his goods to feed the poor, or, in an emergency giving his body to be burned, or in the more academic sense of being a partial philosopher of altruism, ready to lead a revolution of terrorists or to lead a peace congress to advocate a universal amnesty—in short, as an altruist, he is the most incoherent, contradictory barbarian this world has ever produced.

Besides, altruism, like any other charity, begins at home. And man never can be superman in the altruistic meaning until he concedes to woman the opportunity to become superwoman as she long ago yielded him the condition of being the arch-hero of life.

This brings us to the real difficulty. There is not only no such being as the superwoman, but there is neither a hint nor possibility of her ever existing if the human race continues to develop along the present selected lines of progress. Some people may think that she has already existed and passed and that now she lies like the pale shadow of immortal goodness upon the "dust of centuries dark and deep." They remind us of the medieval nuns and mothers. But these were only the martyr women, of whom the little bird-claw, meager-faced lady of modern times who goes about doing tiny goodness is but a feeble type. Neither is the able, executive woman who gives her life to the work of organized charity the superwoman. She is merely altruistic. And all women are by nature altruists, just as all men are egotists. So far they have been the voluntary substance out of which the world of men has been made. They are born with the inspiration to sacrifice themselves and with a genius for achieving this pathetic end. Altruism is not their principle, but their motive for existence. But you cannot become a superwoman simply by being

altruistic. Egotism is also required. Now women have always been vain in a gentle or flamboyant way, but the difference between egotism and vanity is complete. One is an appeal for admiration, the other is an assurance over and above all necessity for admiration. One is mere coquetry, the other is something more than conquest, it is severe, self sufficiency. For this reason many think the "advanced" woman of the present day is the nearest approach we have to the superwoman. As a matter of fact, she is further from the ideal than almost any other. For she suggests agitations, antagonism, rather than repose and power. The chief charm she has is the unnatural one of being too much like the man, and not even the superman. She is at war with him on his own grounds for her rights, or she has set up to lead him according to her own theories. But her whole intellectual importance depends upon her unconscious flattery of masculine vanity. Men are likely to associate the advanced woman with the idea of superwomanhood, because they are complimented to find their own kind of vagaries in a woman's head. She is an interesting feminine copyright of mascu-

MRS. L. H. HARRIS.

line ideas. But that is why she is so far from being the superwoman. She is not woman enough. This is the trouble with various other types of women, more or less admirable. They are either aping the men too closely because they have no intellectual standards of their own, or they are working out their small destinies limited by the economic, social and industrial conditions for which men are responsible. And all the women-righters to the contrary, it is safe to persist in the statement that these conditions never can be changed by female committees, petitions or conventions, but by the enlightened will of the superman. So from all appearances we have a long time before we shall see her.

But when she comes, what will she be like, this altissima-woman? Arch beautiful, of course, for she will no longer be a drudge factor in the industrial world. It is so evident from his physique and his disposition that man was intended to be the bread winner for the world and especially for women, who are handicapped by their beauty, their weakness and, above all, by their holier vocation. Besides, it is profane to destroy beauty in a factory or anywhere or in any way except for the sake of a greater beauty, like the fading of the mother into the freshness of her children.

And she will have that fine emotional egotism of the prophets and the poets, which shall distill the life of the world into the sacrament wine of love. So far women have been so handicapped here. Love has been such a sad duty for many of them; but upon the superman and his children she could will it cheerfully like a great fortune. The man that is does not measure up really to a woman's ideality. He is her taskmaster in the industrial world, her indifferent lord in the home, her cynical traducer, or seducer, in society. But when he has the virtue and grace to become the superman, she may afford the magnificent extravagance of superwomanhood. And altruism will become so natural that we shall lose the whang and whine of the word as we hear it now from the lips of a generation who know it only as a modified or confused form of "canned hypocrisy."

Some literalist will, of course, be bound by his own narrowness to ask what will be the duties of this sublimated woman creature. That is a word which belongs to the world of today, a world of miscreants, who merely pinch out a duty now and then, niggardly fashion, between their dearer vices. When the super men and women inherit the earth there will be no duties, but there will be a growing disposition toward rightness, a taste for Heaven. Preachers and diseases and doctors will gradually disappear and we shall indeed inherit the earth and the fullness thereof. Certainly there will be work and a few inconveniences, but no bondage. In this atmosphere the superwoman will soon manifest herself, a creature more emotional than intellectual, a creature on whom the romance and adoration of the race will fall generously, not grudgingly, and in the half-hearted manner of modern chivalry. And if some think such a creature is but half-defined and incredible, the reply is that so are the angels in Heaven. Still there may be angels in Heaven. And even so in some far off time the superwoman will define herself as a reality when the superman admits her.

NASHVILLE, TENN.

The Pacific Coast and the Orient

BY GEORGE C. PERKINS

United States Senator from California.

TWO wars have caused the entire world to realize that the Pacific Ocean is to be the scene of the greatest of the human activities of the future. The war of the United States with Spain gave us possessions which bring us within speaking distance of Asia, and the war between Japan and Russia showed the former to herself and to the world to be one of the most powerful and progressive of nations, whose future sphere of action would of necessity be within the boundaries of the ocean separating America from the Orient. After the close of the two wars referred to, the people of each country took up with more zest than ever the work of internal development and commercial expansion. Japan encouraged industrial growth and the attainment of Asiatic markets, and America turned its attention to the trade with the East. More than ever the necessity for a shorter line of communication between the Atlantic and Pacific was realized, and the result was the acquisition of proprietary rights across the Isthmus of Panama and the beginning of the construction of the canal. When it joins the Atlantic to the Pacific the course of the world's commerce will be changed. Then the shortest line for sea traffic between the Orient and the eastern shores of the United States and Western Europe will run thru the Isthmus, and then following the great circle route will pass close to the Pacific Coast of North America until it swings just south of the Alaskan peninsula and Aleutian Islands to Japan and China. This, the shortest route to the Orient, will cause the greater part of transpacific commerce to pass within 153 miles of the entrance to San Francisco harbor. These few miles in the course of long voyages between ports on the Atlantic and Oriental countries are so insignificant by comparison that San Francisco will be made a port of call for nearly all the traffic to and from China and Japan. "The City of the Golden Gate" will therefore be drawn into intimate contact with 600,000,000 Asiatics, with whom trade relations will give rise to a commerce so vast that no one now dares to estimate its extent and value. With Asiatic trade Asiatic influences will be brought to bear upon San Francisco, and the problem that will confront us will be: "Shall it remain an American city; shall the entire Pacific Coast be Orientalized or shall it retain its European and Christian civilization?" That remains for us to determine.

Already there are obscure signs that we shall have to contest our right to retain an American character for an American city. It will be well not to heedlessly neglect these signs, but to give earnest thought to a very serious problem which must before long be met and solved. This problem will relate to the Oriental peoples who face us across the Pacific Ocean. It will not be the question of America and Europe, regions of the earth peopled by the same race, whose members intermingle on equal terms, who understand each other and each other's habits of thought, who amalgamate and easily form one homogeneous family which is in no essential particular unlike any of the original constituents. It will be a question of the Orient and the Occident; of races so different in mental characteristics; so separated by thousands of years of development upon lines which seem nowhere to touch; so divergent in morals, ethics and the ingrained habits of scores of centuries that there is no attraction between them, because they cannot understand each other. Each stands isolated and alone as regards the other. There are no points of contact, none of sympathy. Their ideals clash, their motives have entirely different bases; their aims have nothing in common—they are aliens to each other. And how could it be otherwise after two, three or four thousand years of education along entirely different lines? In two, three or four thou-

sand years more the two races will undoubtedly come much nearer together. But certainly not in this century. It is not supposable that we could become Orientalized in a hundred, or even five hundred, years. Why should we, then, have an idea that an Oriental can become Europeanized in a decade or two?

Two irreconcilable races, therefore, are coming daily into closer contact on the Pacific, and there is to be a struggle for supremacy, as there has always been where commerce brings rival peoples face to face. There will be more than a simple interchange of commodities. That we of California ascertained to our cost more than twenty-five years ago, when we found that the greater opportunities of our fair land induced an immigration from China which bid fair to overwhelm us with a people accustomed to taskmasters who set them to underbidding every kind of labor in which a white man could engage. We saw the result in a lowering of the white man's standard of life in order that he might exist, and the gradually decreasing number of trades in which he could find employment at all; and we saw on the other hand the rapid growth of a community differing from ours in practically every important respect, demoralizing in its influence, incapable of being reached by any means of persuasion in our power, and forming in the corporate body an element which, like a cancer, must be removed on pain of death. Thus we developed the principle of exclusion of Asiatics from untrammeled freedom to enter and live within our borders. Thus we came to know that to give free entrance was to surely drive our own race from the field of industrial effort, and that to give the privilege of naturalization in addition would mean the utter subversion of popular government. The entire Pacific Coast, from San Diego along the 25,000 miles of shore line to Point Barrow and the last of our Aleutian Islands, has had the opportunity to study the Oriental, and has learned the lesson which the chance has afforded. The result is that New England was not more firm and earnest in its declaration that it would not submit to taxation without representation than the Pacific Coast States are that their broad fields and fruitful orchards shall not be overrun with peoples more alien to them than the Digger Indians, and that they will preserve the right of Americans to compete only with those whose standards are theirs, and who are capable of building up a community like that which is the just source of their greatest pride.

We have disposed of one question—that relating to the Chinese. Another, and one equally as important, is now beginning to press for solution. What that question is can readily be understood by reading the *Bulletin of Labor* for September last. Hawaii has the Japanese on her hands, as we in California will soon have; and as this people is more aggressive, more tenacious, more cunning and more determined than the Chinese, it will never do to permit a long delay before settling the question once for all. For the people of Japan have started out on a course of commercial development which will at some time bring the United States and Japan so close together that it will be difficult to settle the question at all. Japan is sending out its vigorous and energetic men to all the countries bordering on the North Pacific to which they can gain access. Their object is commercial purely, or for the study of the methods of Western civilization which will add to the strength of the island empire and extend its trade thruout the world. The inherent national traits and patriotic impulses of the Japanese will make them a foreign element in any country to which they migrate. Real expatriation is a condition practically impossible to the Japanese mind, and the extent to which they will occupy the territory of friendly powers will be a displacement of the sovereignty of the power extending them a welcome, and the presence of the sovereignty of the Mikado of Japan. No Japanese can be found in any country whose complete loyalty to the Mikado has suffered diminution, no matter what relation he might sustain to the country in which he is found. It may be asserted with perfect confidence of complete justification in fact that the Japanese do not seek foreign countries for the purpose of extinguishing their loyalty or their patriotic devotion to their native country, but with purposes and aspirations in which the

highest good of their own land is the paramount consideration. In brief, the Japanese, wherever distributed, however numerically strong in any foreign country, will remain a consolidated unit in support of the aspirations of the Japanese race; and however distant their residence from the throne of the Mikado, will still constitute an element of strength in the unity of the empire. Naturalization in any country in which they migrate will not eliminate this racial instinct.

Hawaii presents an epitome of the Asiatic question as far as it concerns our domestic wellbeing and gives us a glimpse into the far future. The third report of the Commissioner of Labor, dealing with Hawaiian affairs, is crammed with pertinent suggestions and with facts whose vast significance is apparent to the most careless reader. Referring to the large and increasing Japanese population—and there are now, according to latest reports, 65,000 in the islands—he says:

"This complete Orientalization of the islands and the resulting character of the working population has created an acute labor problem in Hawaii that presents three phases, according as it is considered from different viewpoints. For the employer, represented chiefly by the sugar planter, the problem is one of securing a sufficient and a stable labor force; for the white and native wage earners and small merchants the problem is one of survival in the face of an increasing, irresistible, and disastrous competition of Asiatics with their lower standard of living; and from the viewpoint of the citizens of the Territory —and of the people of the United States— the problem is one of securing a working population with the civic capacity necessary to the upbuilding of a self-governing American commonwealth."

The Japanese have secured such preponderance on plantations that the management is to a certain extent taken out of the hands of white overseers and superintendents. The effect of this kind of competition is still more apparent in the case of ordinary wage-earners and merchants. Already there are practically no white workers engaged in making garments or boots and shoes. Japanese in many instances monopolize the plumbing trade and the making of tinware. They invade the building trades, and Japanese contractors underbid on all occasions white men competing for the same work. In seven identical etablishments the number of white mechanics diminished in five years from 159 to 43. Japanese are now establishing drug stores for white patronage. Oriental blacksmiths and horseshoers abound, and Japanese boilermakers undersell white men engaged in the same trade. Carriage-making and repairing are done by Japanese. The only occupation in which there is no Asiatic competition is the printing trade. Commenting on these facts, the Commissioner of Labor says:

"It is not easy to give an adequate idea of the resentment and the bitterness felt by the white mechanic and the white merchant who see themselves being steadily forced to the wall, and even driven out of the Territory, by Asiatic competition. They feel that they are being defeated in the struggle, not because of superior mechanical skill or superior business instinct on the part of their successful competitors, but because of a lower standard of living, in the face of which they are helpless. They feel, furthermore, that the white citizen who goes into new American territory to cast his lot with a new community and to join in its upbuilding on American lines is entitled, if not to favored treatment, at least to protection against the kind of competition that the Asiatic alien represents."

In consequence of the Orientalization of Hawaii, says the Commissioner of Labor, there is practically nothing in the Territory corresponding to that element of civilization which is the strength of the States of the Union. The political character of the community is undergoing a slow but inevitable change, which leads to only one result. And the public school system is powerless to offer resistance. The Japanese children not only attend school for a short time, but live apart among their own people where the customs and traditions of Japan are maintained. Moreover, Japanese have been careful to establish schools of their own side by side with the public schools of the Territory. Says the Commissioner of Labor:

"It is an open question whether the final result will be the Americanizing of the Oriental or the Orientalizing of the schools. How far such a swamping of the schools with Orientals will be compatible with the maintenance of an American school system and the exclusive use of the English language in the schools is a question that can be answered only by experience. But there are some indications that the same process of displacement will occur in educational institutions that has already been observed in wage

earning and mercantile pursuits, and that white pupils, at least, will be sent by their parents elsewhere than to the public schools to receive instruction. The motive for segregating pupils of such different racial and lingual antecedents extends beyond mere color prejudice."

Here, then, can be seen and understood the basic facts underlying the action of the San Francisco Board of Education in removing to a separate school Japanese pupils. The conditions in California are, of course, by no means acute, but there is a full realization of the principles involved, and that they should be clearly and unmistakably emphasized now and once for all. There is not in California or in Hawaii a prejudice against the Japanese on the ground that they are an inferior race. No one for a moment could bring a scintilla of proof in behalf of such a contention as that. The world knows better, and no one is more willing than Americans to acknowledge that the Japanese are among the most highly developed of all the races of the earth. In art, religion, culture and all the higher intellectual pursuits except science, Japan centuries ago attained as high a standard as has been reached by man. But that standard is different from ours. Her art, tho unsurpassed, is not the art of the European. Her culture, tho refined thru centuries of thought, is not that of the peoples of Aryan descent. Her religions —for there are two prominent ones— have carried the minds of men to as great hights as has the religion of Christ—but they are not the teachings of the Nazarene. In no branch of intellectual activity does Japan follow ideals at all comparable with our own with the exception of science, and in that she has shown such wonderful aptitude and progress as to place her in the front rank of the nations.

When, therefore, objection is made in any quarter to the presence of Japanese in the midst of an American population, it is not because they are deemed an inferior race, but because as a race their development has been and will, by reason of heredity, continue to be upon lines that impinge upon and break the continuity of our own path of progress. In the thousands of years during which they were developing along these lines so different from our own, they have acquired what may be termed an intellectual momentum so great that they cannot be turned from their course by such ideas and doctrines as we may interpose. They are proud of their own civilization—and justly so—and as a race have no more intention or desire to cast aside the teachings of their past than have we to adopt the ideas and ideals which characterize Asiatic peoples. There is thus no desire and no prospect that there can be an amalgamation with us such as readily occurs between the different branches of the Caucasian race. Even if there were, would it be desirable from the standpoint of either nation? So great an authority on sociology as Herbert Spencer thinks not, for in a letter to Baron Kentaro, on the subject of the intermarriage of foreigners with Japanese, he says:

"The physiological basis of this experience appears to be that any one variety of creature in course of many generations acquires a certain constitutional adaptation to its peculiar form of life, and every other variety similarly acquires its own special adaptation. The consequence is that, if you mix the constitutions of two widely divergent varieties which have severally become adapted to widely divergent modes of life, you get a constitution which is adapted to the mode of life of neither—a constitution which will not work properly, because it is not fitted for any set of conditions whatever. *By all means, therefore, peremptorily interdict marriages of Japanese with foreigners.*

"I have for the reasons indicated, entirely approved of the regulations which have been established in America for restraining Chinese immigration, and had I the power I would restrict them to the smallest possible amount, my reasons for this decision being that one of two things must happen. If the Chinese are allowed to settle extensively in America they must either, if they remain non-mixed, form a subjective race standing in the position, if not of slaves, yet of a class approaching slaves; or, if they mix, they must form a bad hybrid. In either case, supposing the immigration to be large, immense social mischief must arise and eventually social disorganization. The same thing would happen if there should be any considerable mixture of European or American races with the Japanese."

We have, then, the dilemma that large numbers of Japanese, unassimilative, are a danger to the community in which they live, and that should they become assimilative they are equally a danger.

The differences between the races which cause such serious problems to arise when they attempt to dwell to-

gether will make their influence felt when the commerce of the Pacific brings our Pacific Coast into closer touch with the Orient, and there begins to be felt a stress in the struggle for the trade which 600,000,000 of Asiatics will create. That this influence will not tend to the peace of the world is evident when one considers the tenacity of purpose, the pride and the ambition of the two great nations. The difficulty of understanding each other, owing to the utterly different mental character of the two peoples, will tend to prevent such an agreement as would be easily effected were Europeans the inhabitants of Eastern Asia, and not Orientals, with all the traditions and teachings of that land of mystery.

Conflicts between nations are the result of antagonisms which lie at the very foundation of their purposes, their aspirations, their growth and expansion. The presence of Russia as a prime factor in the commerce of the Pacific Ocean was inimical to the aspirations of the Japanese Empire in the same line. The occupation of Manchuria and the fortification of Port Arthur were the immediate excuse, but not the real cause of the war. The real cause of the war was the inherent antagonism of interest and purpose which could find no other solution than the arbitrament of the sword.

We have acquired territory in the Pacific Ocean; we have laid the foundation for commercial primacy on that great sea. We have a position at the very doors of the Orient by the possession of the Philippines and a base of naval operations in the middle of the ocean by the incorporation of the Hawaiian Islands. We have a shore line under the jurisdiction of the American flag, which, following its indentations on the Pacific Ocean borders of the Pacific States and the Territory of Alaska, comprises twenty-five thousand miles. We have laid the foundation for commercial supremacy on the Pacific Ocean, and at some point in the future course of national destiny the pathways of national progress on the part of Japan and the United States will converge to a point of inevitable conflict of interests.

It is useless to speculate as to what the occasion or excuse for this conflict may be, or when it may arise. The small cloud which is now hanging on the horizon of the two nations appears to relate to the dissatisfaction of Japan with the domestic policy of the State of California relating to its educational interests. The administration of the educational affairs of California have not been fortunate in meeting with the approval of the Empire of Japan; but this educational policy is not a reason for disturbing the amicable relations between the two nations. The fundamental cause lies at the very foundation of the national character of the nations to the controversy.

The future of the entire Pacific Coast depends on the character of the relations which will exist between the people of the great countries which hem in the Pacific Ocean on the east and west. Each of these peoples will have to solve its own problems growing out of the increasing intimacy of intercourse. There is reason to believe that on the other side of the Pacific there will be adopted a policy discouraging the influx of a people radically differing from the Oriental, and that there will be reproduced there most of the arguments which have been made on this side of the ocean against unrestricted immigration of Asiatics and their naturalization. Whether hostility shall arise from such domestic policies will depend on the temper of the different peoples concerned. It is to be hoped that each will be able to put itself in the other's place and try to understand the conditions which make certain policies desirable. It is probable that it will not be difficult to harmonize the ideas of the Occident and Orient on these points. But when there begin to arise questions growing out of the increasing commerce of the countries bordering on the Pacific, the problems will be more difficult of solution, and will require the exercise of diplomacy of the highest character. And these questions will begin to arise as the Panama Canal nears completion. If there is to be a struggle for commercial supremacy on the Pacific it will doubtless come before the canal is finished, for after it is open to the world the United States will be in a position to exert all its great power in behalf of its Pacific interests, and its Western coast will become, in relation to the rest of the country, as important as its Eastern. It is to

be hoped that the commercial opportunities of the great ocean will be deemed many and varied enough to satisfy the demands of Asiatic and Caucasian without the threat of a clash of arms, but whether such will be the case the future only will determine.

But racial feelings should not, and I believe will not, lead to actual armed conflict. Japan has given evidence of wise and progressive statesmanship, and we can hope also for such in the future on our own part as we have had in the past. The cost in men and treasure is growing greater in every succeeding war, and neither Japan nor the United States would hastily appeal to arms when the spirit of reason is beginning to rule the world. To do so would be to belie the renown they have of being the most progressive nations of the globe. And fortunately the Hague Tribunal stands ready to consider in all fairness those great questions that tend to disturb the peace of the world. I am sure that we of America would consider ourselves great and strong enough to submit to this tribunal any dispute not affecting our honor, and that Japan would consent, if not insist, that this be done.

WASHINGTON, D. C.

The Position of Child Labor Legislation

BY ALBERT J. BEVERIDGE

[The only argument against national restraint of child labor is its asserted unconstitutionality, and it is answered by the Senator from Indiana in the following article. This is an authorized statement of the perplexing proposition as it appears to Senator Beveridge, who has devoted more time and energy to the development of some scheme of relief than any other American.—EDITOR.]

THE enormous mass of evidence submitted to the Senate and the country, all under oath, has settled the question of the existence of the infamy of child labor in the United States in the twentieth century. Before the sworn testimony was submitted those who hoped to kill the bill were saying in conversation that the evil "was greatly exaggerated" and the like. Now they admit the enormity of this national shame, but are saying that the Nation has no "constitutional power" to remedy it, and that it "must be left to the States"—this notwithstanding the fact that it has been left to the States and that they have failed and always will fail. They failed, and always have failed and always will fail, because there can not be and never has been uniformity of State legislation, and could be no uniformity of execution even if uniform legislation were possible. They fail and have always failed because the mighty interests which fatten on child labor are so powerful as to prevent the passage of thoro legislation, or, if under the pressure of public sentiment, thoro legislation is passed, these interests are so powerful that they prevent its thoro execution. It is a national evil which nothing but a national remedy can cure.

But the enemies of the bill say that the Constitution forbids the Nation from remedying this national evil. They say that under the power which the Constitution gives Congress to regulate commerce "with foreign nations, among the several States and with the Indian tribes," Congress is not empowered to prohibit, but only to regulate commerce. The answer to this is that from the very beginning Congress has prohibited both foreign and domestic commerce in many articles; and wherever one of these laws has been questioned in the Supreme Court, that great tribunal has, in emphatic language, declared that Congress has the power to prohibit the importation of any article it

chooses in foreign commerce, or in any article it pleases in interstate commerce.

For example, Congress passed a law prohibiting interstate carriers from transporting obscene literature, and the court held that law valid. Congress passed a law prohibiting lottery tickets from being carried in interstate commerce. That law was resisted as fiercely as any statute ever was before the Supreme Court. But the Supreme Court in one of its greatest and most historic decisions, under the title of the "Lottery Case," held that the power to regulate commerce included the power to prohibit commerce. It was suggested in the Senate debate that obscene literature and lottery tickets were evils in themselves and that this was why the Supreme Court held that Congress has the power to prohibit interstate commerce in them. The answer to that, of course, is that the nature of the article is what determines the *policy* of Congress in prohibiting interstate commerce in that article, but it does not affect the *power* of Congress to do so. The power of Congress is conferred by the Constitution, and not by the nature of the article.

Accordingly we see that Congress has prohibited interstate commerce in articles that are entirely innocent in themselves; for example, we prohibited interstate commerce in gold and silver wares if such wares have the words *United States Assay* or any similar words on them—altho this gold and silver ware hurts neither the health or morals of the people and are entirely genuine. Again, we prohibited interstate commerce in uninspected foods and meats, altho such foods and meats may be entirely wholesome and not only not injurious but actually beneficial to the health of the people. The prohibition of such interstate commerce in uninspected meats, foods and cattle is merely a precaution. Many other similar illustrations might be given of existing laws prohibiting interstate commerce in entirely innocent articles, all of which shows that the nature of the article has nothing to do with the *power* of Congress to prohibit interstate commerce in that article; but that the nature of the article is what determines the *policy* of Congress—that is to say, determines whether or not Congress will prohibit interstate commerce in that particular article.

It was said in the Senate debate that Congress has no power to pass a law directly prohibiting child labor in a State, and that, therefore, we have no power to do indirectly what we cannot do directly. The easy answer to this, of course, was that neither has Congress the power to pass a law directly prohibiting lotteries in a State; but that, notwithstanding, we have passed a law doing indirectly what we could not do directly—and the Supreme Court has held that law valid.

Again, there are no less than a score of decisions of the Supreme Court expressly declaring *in terms* that the power of Congress over interstate commerce is not only similar to but absolutely identical with the power of Congress over foreign commerce. Unless the Supreme Court reverses a multitude of decisions holding this absolute equality and even unity of the power of Congress over foreign and domestic commerce, the question is not open to debate. But under the power of Congress to regulate foreign commerce, Congress has prohibited the importation of goods made by convicts, and since the Supreme Court has held the power of Congress over interstate commerce to be as great as over foreign commerce, we can of course constitutionally prohibit *interstate* commerce in goods made by convicts. But if we can prohibit interstate commerce in goods made by convicts, of course we can prohibit interstate commerce in goods made by children, so far as our constitutional *power* is concerned.

The only argument against the exercise of this power is the old, moth-eaten argument, that if you grant the existence of such a power, it might be abused. It is said, "If you can do this, you can do much worse things—and therefore you cannot do this." But this argument was answered almost a hundred years ago by the Supreme Court of the United States in Gibbons vs. Ogden, the opinion being delivered by the greatest jurist of all time—Chief Justice Marshall. And the Supreme Court since that time has held, in a large number of cases, the same thing, to wit, "possible abuse of a power is no argument against its existence," to quote the exact words of the Supreme Court.

Chief Justice Marshall pointed out

what of course is obvious to everybody who thinks about it, that the remedy for the *abuse* of power is in the hands of the people at the ballot box. If we exercise this power foolishly, the people will punish us by retiring us from public life. Let us take some recent examples of this: Congress has the power, and accordingly has required interstate railroads to use the block signals. But if Congress can require railroads to use block signals, Congress could also require railroads to station men with red lanterns at every hundred feet of their lines. We have the power to do that very thing; but of course we cannot do it because it would be absurd. And yet, if the argument of the abuse of power, which is urged against the Child Labor Bill is valid, it would have prevented Congress from requiring railroads to use the block signals.

In conclusion, it is interesting to note that we have prohibited interstate commerce in insects—nobody objected; in "loose hay" on vessels—nobody objected; in uninspected meats, foods, quarantined cattle, gold and silver and a number of other articles—and nobody objected.

In view of the decisions of the Supreme Court, which are numerous and emphatic upon the power of Congress to prohibit interstate commerce in various articles; in view of the even more numerous decisions of the Supreme Court that our power over foreign and domestic commerce is the same, and that under the former we can prohibit convict-made goods and we therefore can do the same thing under the latter; in view of the large number of laws already passed prohibiting various articles from both foreign and interstate commerce, does it not seem strange that men should labor so hard to find that we have no power to prohibit interstate commerce in goods made by the murder of children?

WASHINGTON, D. C.

The Chosen Reed

BY JAMES HERBERT MORSE

With little circumstance of pomp arrive
The Kings of thought;
The echoes of their going out survive.
So Judah's mountains loved to fling
From crag to crag,
When kings were not,
The name of king.

It was their boast:—"Here ran his baby feet,
Beloved of God!
Our rivers paused amid their herbage sweet,
To amplify some haunted spring,
Where came his sheep
To sip and nod—
And he to sing."

The valleys sang:—"Here was the wonder bred;—
We knew him well.
The while amid the upland dews he led
To richer hights his father's flocks,
His merry harp
We learned to tell
Among the rocks."

They knew him only such, until he took
A smooth round stone
That slingers use, from out a running brook,
And stood against a people's host,
With sling in hand—
One lad alone—
And slew their boast.

The less we knew and prophesied the grace
That was to be,
The more we linger round the holy place—
Its cradle, when we knew it not,—
Some strange and sweet
Expectancy
Still haunts the spot.

Each bird that pipes—each dew-bespangled spray
Wins a new meed,
Because the feet of kings have passed that way—
Because the least that is, of choice,
May be, with God,
The chosen reed
Of purest voice.

NEW YORK CITY.

Aeronautics in America

BY AUGUSTUS POST

Secretary of the Aero Club of America.

ON January 1st a committee of the Aero Club of America made the tests preceding the selection of the city of St. Louis for the international cup contest next October. The committee found full confirmation of all aerostatic conditions desired. St. Louis is an ideal aeronautic port. It is far removed from the sea in every direction. The balloonist has the chance of hundreds of miles over land toward every point of the compass—a condition of the greatest importance, since the points in the contest are for the longest distance and the whole distance, as well as for the equilibrium in the air and the manner of landing. In St. Louis there will be abundant gas, free of charge to contestants. A starting point will be provided in Forest Park, a portion of which is to be enclosed so that there shall be no interference with the inflation of balloons. A St. Louis Aero Club was immediately formed, and this club is now negotiating for the balloon "United States," in which Lieutenant Lahm won the Bennett Cup last year and brought the races to America. This club will do all possible to encourage local participation; sums of money as second, third and fourth prizes are offered by various St. Louis organizations. With all of these favorable signs the committee is sure that it has chosen a suitable city. The contest will be held during the period of full moon in the month of October, probably about October 19. Fine weather, with a temperature of about 64 degrees, is to be expected at this season of the year in St. Louis. There are usually only three or four days of rain in the whole of October. The requirement of ten previous ascensions, two without assistance and one at night, will be made of competitors.

An ambitious precedent for the contestants is afforded in the balloon flight of John Wise, from St. Louis, July 1-2, 1859. This was the longest aeronautic journey ever known to have been accomplished in the United States, and held a record unsurpassed in the world until Count Henri de la Vaulx raised it in 1900, with his balloon flight from the Paris Exposition 1,300 miles into the interior of Russia.

The "Atlantic," Professor Wise's balloon, covered a distance of 1,150 miles in 19 hours and 40 minutes. It left St. Louis at 6.40 o'clock Friday afternoon, July 1, 1859, and landed at 2.20 o'clock on the afternoon of July 2 near the village of Henderson, Jefferson County, N. Y. The route taken included Pana, Ill.; Fort Wayne, Ind.; Fremont, Sandusky and Fairport, Ohio; Dunville, Canada West, and Niagara Falls. There were four voyagers—Professor Wise, of Lancaster, Pa.; John La Mountain, of Troy, N. Y.; D. A. Gager, of Bennington, Vt., and William Hyde, of St. Louis. The balloon contained 60,000 cubic feet of gas, and was equipped with 900 pounds of ballast.

This trip was an adventurous one. Wise, during the early part of the night, narrowly escaped asphyxiation from having fallen asleep with his nose immediately at the end of a pipe of escaping gas. The other three members of the party, who were in the lower basket, observed his silence, and Gager climbed in the dark, hand over hand, up into the basket, where he found out the trouble and with difficulty aroused his companion. About 2.40 o'clock in the morning the balloon came so near the ground that the bags of ballast thrown out could be heard as they touched the earth. In the early morning the city of Toledo was seen, and at 7.25 o'clock the aeronauts sighted Sandusky. They raced, at 9.30, with a steamer bound for Buffalo, and crossed Lake Erie in three hours. At noon the balloon was about midway between Buffalo and Niagara. Lake Ontario filled the balloonists with terror, for there was no more ballast left, and it seemed impossible to cross the lake with the balloon so low in the air. A storm was raging. But there was no alternative except to continue the course. Wise, Gager and Hyde climbed up into the

balloon, but La Mountain insisted upon remaining below, taking a most hazardous chance. To those above, the lower basket seemed at one time to dip into the lake. La Mountain's cap was seen upon the water. The balloon then, according to the record kept of the time spent covering the 190 miles across the lake, was speeding at the rate of 2 miles a minute. The fears for La Mountain were soon removed. "I'm all right," he cried from below. The balloon rushed on, now over land on the United States side, and scraping tree tops for the last mile of its flight. The grappling hook was torn off. A sycamore tree at last caught the craft, and the four men, uninjured, climbed out, 20 feet above ground. The balloon was in shreds.

Hoping to repeat or perhaps distance this notable feat, John Wise again ascended from St. Louis, September 28, 1879. This flight resulted in his death in Lake Michigan, so far as all the evidence points. The debris of the balloon was found on the surface of the lake, and the body of Wise's companion, George Burr, of St. Louis, was washed ashore. The remains of Wise were never found, but his relatives were convinced that he perished in the lake. This balloon rose with the disadvantage of bad weather and of an accident to the network of the balloon. In starting, the car crashed heavily against an oak tree, driven by the wind. The balloon continued in a northeasterly course. When above Alton, Ill., the aeronauts dropped some advertising hand-bills which they were to distribute. For about 70 miles northeast the route was traced, then nothing more was heard of it except that a brakeman near Chicago thought he saw it over the lake, about midnight.

The northward tendency of this balloon must be taken as an exception to all the probabilities when the balloon rises to any considerable hight. The likelihood is altogether in favor of winds due east.

About 100 experimental sounding balloons were sent up from St. Louis in 1904, 1905 and 1906, by Prof. H. H. Clayton and Prof. S. P. Fergusson, of the Blue Hill Meteorological Observatory, for the purpose of meteorological investigation. Mr. A. L. Rotch was responsible for these experiments. The balloons were six feet in diameter, and each parachute was conspicuously marked, the promise of a money reward bringing back almost every balloon sent up. Almost all of them went due east. One exception, the balloon landing at Iuka, Miss., January 25th, 1905, was interesting as showing the extreme velocity of the upper winds. It rose to a hight of six miles, and made the trip of over 200 miles in exactly two hours, from 2 to 4 p. m.

The balloon, "L'Orient," which was sent up on New Year's Day by the committee of the Aero Club of America, went eighty miles to Cliffdale, a small village eight miles from Pearl, Ill. The aeronauts making the trip were Alan R. Hawley and J. C. McCoy, directors of the Aero Club. The other members of the committee were Cortlandt F. Bishop, president of the club; Augustus Post, secretary, and Leo Stevens, an airship builder and navigator. With the committee also was Frank S. Lahm, of Paris, father of Lieutenant Lahm, and himself an experienced aerial navigator and dean of the French pilots.

"L'Orient" started at 1.30 p. m., rose to a hight of 1,800 feet, came down to 900 feet, then went back to 1,700 feet, after which it continued in very good equilibrium, the aeronauts making one more descent to see the prospect of landing, but rising again, as the place seemed unsuitable, and landing later at Cliffdale, as stated, at 4.30 o'clock. Eleven bags of ballast were provided and three were used. The direction at first was west, then north, following the course of surface winds. The day was an extremely mild one for January; at the balloon's greatest hight the temperature registered only 40 degrees above zero. The balloon did not rise to the swift upper currents available for a long flight, as in this case it was desired to land within a few hours, before dark. The test was principally to determine whether gas could be easily obtained. The situation in this respect was found to be very satisfactory. "L'Orient" was inflated with 35,000 cubic feet of gas in less than an hour. It was filled by the

Laclede Gaslight Company, in the southern part of the city, near the river.

Some of the "fun" of aerial navigation was experienced even in this short flight. As they were descending in Pike County, to land, Mr. Hawley and Mr. McCoy shouted down "Happy New Year" at the farmers who were abroad on the roads and in the fields. The people looked about them in amazement, never thinking that the voices might come from steel rails. They began to descend over Calhoun County, which happens to be the one county in Illinois without a railroad. When they saw only country roads threading the region, they threw out ballast and rose again. It is a serious thing to come down with the impedimenta of an air-vehicle, in a place where there is no means of heavy earth-transportation. As it was, in their second effort, when our aeronauts came down in Pike County,

AERO CLUB COMMITTEE IN ST. LOUIS, JANUARY 1, WITH LOCAL RECEPTION COMMITTEE.
Top row, left to right: D. C. Nugent, James E. Smith, Leo Stevens. Bottom row, left to right: J. C. McCoy, Cortlandt F. Bishop, Alan R. Hawley, Augustus Post.

above. The domestic animals, too, were aware of some disturbance, and became highly excited. As the balloon passed over a pond, some geese thereon squawked in wild confusion and fled to shelter. Among a flock of sheep the balloon's guy rope was trailing on the ground; these sheep were immediately dispersed hither and thither with all the sheep foolishness imaginable.

The railroad becomes an ally of the aeronaut. The men in "L'Orient" would have preferred to land a little nearer the they landed at a railroadless village and were obliged to take a stiff walk of eight miles in the dark to a telegraph station. They and their balloon arrived safely in St. Louis the next day.

This typical landing illustrates how easy it is, when one has time, for the aeronaut to become acquainted with the real life of the farmer. His opportunity is such as the city man can never know in any other way, for when such a novelty as a balloon comes down, the country people will crowd around, ask questions,

and in a little while become the best of friends with the visitor.

Then there is such an incomparable chance for viewing the landscape. From the balloon it spreads out before one like a painting. Nothing is hidden. In the automobile it is necessary to follow the conventional roads. The automobilist may look at the walls around some splendid estate, and he has the doubtful pleasure of imagining that that place may be laid out with lovely gardens and shrubbery and walks and fountains, if he could but see them. But the balloonist sees all, unhindered by fences and walls. He can go in a straight line, too, making better time than any earth-vehicle, and if he has a motor-balloon, he can take any direction. Even supposing a case in which the automobile went forty miles an hour and the balloon but twenty, it is probable that the balloon would reach a given point first, because it would make none of the deflections required by a winding road.

A man who never leaves the earth has a very limited idea of the beauty of large bodies of water. From near at hand, when he looks into a lake, the rays of light are so reflected that he can see only a few inches below the surface. But the flying bird and the balloonist look thru the clear water directly to the bottom.

Aeronautics will put an end to most of the maneuvres of war, making idle child's play of them. A spy of the enemy, in a balloon, could easily discern a submarine boat in the water, and moving along in his balloon he has simply to look down to discover the profoundest secrets, his adversary's defenses, where his stores are disposed, the strength of his fortifications and his armies.

The wonderful fascination of the sport cannot be exaggerated. Even the sphere of the balloon, as one looks up into it, is a thrilling sight. The gas is transparent, of course, and it seems as if one is carried along by an empty shell, merely floating thru the supporting atmosphere. Such a feeling of infinity comes upon the voyager as he never knows on earth. He is here detached from all things earthly. He is not sensible of any feeling of dizziness, possibly because of this detachment. There is a joy of conquest in personally realizing the solidity of the air and the power of man to sail upon it. There is an unexplored field of discovery. We know many facts about the other elements, earth, water and fire, and use them to our advantage. We have experimented with the properties of these, for pleasure and for profit, even to the making of diamonds and rubies with intense heat. But of the air we know almost nothing. To make charts of unknown currents, to measure the sustaining power of the atmosphere, to travel at a speed unknown to terrestrial travelers, to study the heavenly bodies from a moving observatory above the clouds, these are scientific achievements in a new field.

The bringing of the races to America will perhaps do for the balloon in this country what has already been done for the automobile. The air-vehicle is more delightful and equally as safe. Why should it not become as popular as the automobile? In Europe, especially in Paris, it is so simple a matter to ascend. One steps from a velvety lawn easily into the car, and parties of four or five are constantly flying over the city. It is no uncommon thing for eight or ten touring balloons to make ascents on Sunday afternoons. Ladies and children attempt the flights without injury; accidents are extremely rare. Plenty of balloons in this country and easy facilities for using them ought to be all that is needed to bring the amusement into customary use, for it can never be said that Americans are of less adventuresome temperament than Europeans.

New York City.

Literature

Tolstoy on Shakespeare

*Tolstoy on Shakespeare** is the title of a small but surprising volume of Shakespearean criticism, to which Count Tolstoy, his disciple the late Ernest Crosby, and George Bernard Shaw make contributions. Tolstoy's essay was called into being by his desire to contribute a preface to an article by Mr. Crosby, entitled "Shakespeare's Attitude Toward the Working Classes." Mr. Crosby's article, with an extract from a letter by Mr. Shaw, appears in an appendix. The three writers constitute a rare group of iconoclasts. Tolstoy aims to show unequivocally that Shakespeare has no dramatic ability; Mr. Shaw to show that he is not a philosopher; and Mr. Crosby that his outlook upon humanity was so narrow and so affected by class prejudice that he was entirely unable to see nobility of character, or effective dramatic situation, in the middle or lower ranks of society.

Of these criticisms, that of Tolstoy naturally attracts most attention. Accustomed as we have become to the curious independence and aloofness of Tolstoy's views in matters of political and social philosophy, we are nevertheless pretty well agreed that he is in literature the most commanding figure surviving in the present day. The lay reader, therefore, even recollecting the heterodoxy of "What Is Art?" willingly places himself in a receptive attitude.

When he was a young man of twenty-five, Tolstoy tells us, reading Shakespeare produced in his mind only bewilderment and "irresistible repulsion and tedium." He long debated whether he himself were senseless, or whether the senselessness lay in the adulation universally given to Shakespeare. To approach the problem as fairly as possible, he reread the plays at various times during the next fifty years in English, in Russian, and in Schlegel's German translation—with unvarying result. Finally, at seventy-five, his bewilderment vanished, and his conviction became clear that "our unquestioning belief in the glory of Shakespeare's genius is a great evil, as is every untruth."

Much of the present essay, in which he has embodied his reasons for this judgment, is occupied with a detailed analysis of "King Lear," chosen as the crowning instance of Shakespeare's alleged consummate mastery of the dramatic art. The chief conclusions reached in the course of this examination are that the actions of the characters in the tragedy are arbitrary and improbable, and cannot therefore appeal to our understanding or sympathy; as when Lear, on the impulse of a moment, curses his favorite daughter and disinherits her in favor of her hypocritical elder sisters, Goneril and Regan. Secondly, the speeches of the several characters in no case truly spring, as dramatic dialog must, from the proper personalities of the actors, or from the situations in which they are placed. The characters are "mere phonographs of Shakespeare" without individuality of their own. Thirdly, all the persons in the play speak an artificial Shakespearian dialect, void of individuality, which is pretentious and inflated when they mean to be impressive, and mirthless and dull when they mean to be witty. Lear's speeches in the storm scene on the heath are "incessant, pompous, raving." The words of the Fool in the same scene "serve no purpose." Finally, the characters "think, speak and act in a manner quite unconformable with the given time and place," *i.e.*, Britain, in the year 800 B. C.

These conclusions are such, moreover, declares Tolstoy, as every one "not under the influence of suggestion will derive from all the other extolled dramas of Shakespeare, not to mention the senseless, dramatized tales, 'Pericles,' 'Twelfth Night,' 'The Tempest' and 'Cymbeline.'" "Open Shakespeare wherever you like," he says, "you will see that you will never find ten consecutive lines which are comprehensible, unartificial, natural to the character that says

* TOLSTOY ON SHAKESPEARE. A Critical Essay on Shakespeare, by *Leo Tolstoy*; followed by "Shakespeare's Attitude Toward the Working Classes," by *Ernest Crosby*, and a letter from *George Bernard Shaw*. New York: Funk & Wagnalls Co. 75 cents

them." The older plays from which he borrowed his plots are better dramatic constructions than those which he has built upon them. His work has, in short, "nothing in common with art and poetry." Such power as Shakespeare does possess lies chiefly in his capacity of representing scenes expressing the play of emotion. The method is epic rather than dramatic, but the product is utterly lacking in the truth and sincerity of Homer.

We have no space in which to reply to these judgments; nor, perhaps, is such a reply required. The criticisms cited amount in the end to this: that Shakespeare is deficient in dramatic sense, and in realism. Fundamentally no doubt in Tolstoy's case they reduce to a matter of temperament and mental habit. Singularly enough the first of these criticisms is one that has been urged with especial force against the work of Tolstoy himself. In our opinion the reader of the plays may be left to determine both of the points raised for himself. To be sure, if it be true that the persons in Shakespeare's plays are "mere phonographs" of their creator, without characters of their own, one might properly seek the reason why it is so difficult to derive the tangible personality of the man Shakespeare from his works. A like difficulty does not exist in the plays of—say—Mr. G. Bernard Shaw.

No doubt such critical onslaughts upon our accepted standards of literary achievement, as those contained in this little volume, serve a useful purpose, if only by arousing us from a conventional and lazy acquiescence in fundamental matters of literary taste, which receive from us all too little consideration.

The Novels of Five Women

It is with real enthusiasm that we hail a new novel by Mrs. Steel, *The Sovereign Remedy*.[1] The title is unalluring, but the book is a beautiful story, beautifully told. It emerges quite evidently from a full mind, a wide experience and an appeased and noble outlook upon life. Without the vulgarity of adherence to any of the modern "isms," Mrs. Steel has overlooked the new theories as they passed in review, simplicity of living, the attempts to destroy the artificial, the conventional, the unworthy, and put essential truths in the place of the theosophies which are a cheapened reflection of philosophy. Her long residence in India, "where under the shade of many a tree men lived, and apparently lived happily, possessed of nothing but their souls," fitted her especially to judge of this modern influx of Eastern thought, and the very fact of her being a woman makes her more capable than Hardy, who has touched the same theme, to transcend the love of the mind and tell a story of the love of the soul, the highest love as yet recognized between men and women. In a short space, one can do no more than indicate the lyric rapture she has caught in writing of the Welsh hills in spring with their miraculous carpet of blue iris, the very "floor of heaven," and of the robin singing on the topmost twig of the scarlet-berried holly tree, singing of "the Beginning it did not remember, of the End it did not know." There is a touch of dreamland gilding the grimed reality thruout, and above all the note of the new consciousness, the thought men are most taking to heart today of "how all these little lives of ours work into one big Whole." One closes the book with a certain reverent gratitude for its beauty and its purity, and one knows, for the moment at any rate, that it is not the condition but the outlook, not the so-called fact but the Dream which, in the end, is the essential truth of life.

It is almost unfair to place another current novel close to one that stands so entirely alone as Mrs. Steel's, and yet Miss Jane Findlater has quite definitely the story-teller's gift, and she has hit, in the *Ladder to the Stars*,[2] upon a most poetic and attractive title. Every one remembers the tiny Blake drawing, so slight, so dimly executed and yet so universal in significance and appeal, from which she drew the suggestion. Miss Findlater tells the story of a young English woman of aspirations, unhappy in a lower middle class environment, who struggles and fails and struggles again and succeeds.

[1] The Sovereign Remedy. *By Flora Annie Steel.* New York: Doubleday, Page & Co. $1.50.

[2] A Ladder to the Stars. *By Jane Findlater.* New York: D. Appleton & Co. $1.50.

and becomes a famous novelist, beloved of a great genius, and in the end marries and settles down with that rather plump, heavy security which the thought of a good marriage always seems to inspire in the young English woman, however superior. Miss Findlater is none the less a born story-teller, a factor that one dare not discount. She knows her story well, and she knows her people, and draws the vulgar, convention-ridden, lower middle class with their dull and sordid lives, made up so exclusively of raiment and food, with a certain truthful if incisive cruelty.

Miss Alice Brown is one of the writers who has steadily made for "The Real Thing," she studied her craft, she industriously formed a style, she recognized her own field and appropriated it. It has been wittily said that Miss Alice Brown has exploited the jilted woman in every phase of her being. That is a cynical way of putting the fact that Miss Brown desired to study chiefly the birth and the growing into consciousness of the soul, and the people who are comfortably married are all too prone to sit down in their bodies and rouse them only for exigencies of raiment and meal-times. If one is doomed to read love stories, the unhappy ones are by all odds the most stimulating, and time has wearied us of the mere little roughnesses that beset the path before the ceremony. Miss Brown is at her highest when she expounds the doctrines of renunciation and of that love which asks not, neither receives reward, but like a natural jutting fountain, waters its own sources. Therefore, in the new book,[3] the "Cave of Abdullam" is the best and most poetic story, tho it is difficult to pass over "A Sea Change" and "The Pilgrim Chamber" without special praise. The people in the book are mainly earth creatures, dimly aware of, but in no wise intimate with their own mental processes, and they are handled with insight and unfailing charm.

One is reminded, in writing of Mrs. Mary Wilkins Freeman, of the *bon mot* of Heine anent a French poet, that he was "A young man with a very brilliant past." Mrs. Freeman is still a young woman. In quite early youth she invented a *genre* of her own and wrote two small volumes of short stories as unexcelled in their own field as are de Maupassant's in his very much larger and more important sphere. Mrs. Freeman seems to be one of those people born with a definite gift, entirely spontaneous and untrained, of telling with combined pathos and humor just what she has seen. Her short stories are a lasting delight and her novels an inevitable disappointment. The opening chapters of *By the Light of the Soul*[4] are descriptive, full of keen perception and interesting, but the development of the story is unconvincing, the morality twisted, and the Enoch Arden-like ending loses all the note of the inevitable which makes the beauty of the basic poem by the fact that the immoral and quite tragic situation is knowingly wrought by the heroine. Surely a soul does not come to birth by projecting its dearest treasure into a position both humiliating and illegitimate; by a livelong deception and by an almost blasphemous disregard of its own worth. The theme required a bigger philosophy of life than Mrs. Freeman could bring to bear upon the subject, and the end is lamentably unconvincing and unsatisfactory. We are neither glad nor are we sorry at the end, and we lay the book down perfectly certain that the heroine will some day be found out and that she will deserve her fate.

The Grey Mist[5] is a goodly volume to look upon, with its soft gray cover of misty lines and the beautiful illustrations by the author's own hand. Also we welcome with joy the little introductory poems heading the chapters and striking the keynote. It is an old-time practice, unhappily in much disuse, but still effective. The author knows the coast of Brittany, its people, its tides, its storms, and has told a tragic story with a wealth of poetic and picturesque vision. The book will bring back to those who know it very vividly the haunting charm of the shore, the fog-damped, dark escarpments of the cliffs at night, the furze-clad slopes of the inland, the pine woods, and over all the gray mist that closes at last over us all with pitying wings.

Babylonian Researches

A NEW volume has been added to the fine series of works projected to publish the objects found at Nippur by the expeditions of the University of Pennsylvania at Nippur.[1] Of this series there have appeared Volume I, parts one and two, by Professor Hilprecht; Vol. IX, by Hilprecht and Clay; Vols. XIV and XV, by Prof. A. T. Clay. Other works by Dr. Ranke and Dr. Fisher belongs to other series as do Dr. Hilprecht's more popular volumes. Reviews of this present volume are likely to devote particular attention to the unfortunate personal controversy as to Dr. Hilprecht's account of tablets said to have come from the so-called Temple Library, an embittered controversy in which Dr. Hilprecht was supported in the investigation by the trustees of the university, but in which the scholars were generally against him. We regret that this controversy has been brought into this Part, and that a fuller discussion is promised in the second Part. While the explanation and defense were imperative, they should have appeared in some other way, and not in a work of pure science. Dr. Hilprecht still asserts the existence of a Temple Library, and includes in it all the texts of this volume, but they come from various mounds at Nippur, excavated in different years, and include one tablet much discussed which Dr. Hilprecht now admits was purchased as from Abu Habba, but which he insists was stolen from Nippur.

But leaving these matters which should have had no place in the volume, we turn to its really valuable contents. There are here an unusually large number of the tablets which may be called the school exercises of a temple school. Of these Dr. Hilprecht has gathered as many as are in all other known collections. There are over thirty including multiplication tables, division tables and square roots. Other tablets have to do with the fractions of the number 12,960,000 = the square of 3,600 or the fourth power of 60; and 60 is double the product of the three first prime numbers, 2, 3 and 5; and 360 is the number of days in a year of twelve months. Professor Hilprecht finds this number, 12,960,000 central to the numerical calculations of these tablets, and with it he connects the Platonic doctrine of numbers which must have come from Babylonia thru Pythagoras. In a very interesting way he shows, thru the Platonic numbers, that the great number, the square of 3,600, represents days, which, reduced to years of 360 days, gives us 36,000 years, which was the "great Platonic year," and equally the Babylonian cycle.

The metrological texts are less interesting but have their value. More important is a single tablet containing a dynastic list of some of the kings of Ur and Isin, of whom the first in the list, Ur-Engur (usually called Ur-Gur), is assigned to some time between 2500 and 2200 B. C., which puts the elder Sargon between 3000 and 2700 B. C., and Hammurabi, the contemporary of Abraham, between 2000 and 1830 B. C. This brings down the latter's date much below the usual assignment; and we are interested to observe that the extreme antiquity which in his previous volumes Professor Hilprecht gave to the beginnings of Babylonian history is wisely reduced by several thousand years.

The Part is a decidedly valuable addition to Babylonian science. The work is done in a thoro and scholarly way with abundant credit to other scholars as shown by the multitude of citations. It is a credit to the university, and, without expressing ourselves again on the old personal matters involved, and which should be treated by him separately, those charges of misrepresentation in earlier writings should not be allowed to detract from the value of these scholarly researches.

To the somewhat numerous, mere popular books on the Bible and the Monuments, Dr. A. T. Clay has added another which deserves a creditable place with them, entitled *Light on the Old Testament from Babel.*[2] Other such works published of late years are C. J. Ball's "Light from the East," Dr. T. Nicols's "Recent Archæology and the Bible," Prof. Ira M. Price's "The Monuments

[1] THE BABYLONIAN EXPEDITION OF THE UNIVERSITY OF PENNSYLVANIA. Series A. Cuneiform Texts. Edited by *H. V. Hilprecht.* Vol. XX. Part I. Mathematical, meterological and chronological tablets from the Temple Library of Nippur. *By H. V. Hilprecht.* 4to, pp. xvii, 70, with 30 autographed plates and 15 phototyped plates. University of Philadelphia.

[2] LIGHT ON THE OLD TESTAMENT FROM BABEL. *By Albert T. Clay, Ph.D.* 8vo, pp. xvi, 437. The Sunday School Times Co., Philadelphia.

and the Old Testament," and Dr. T. G. Pinches's "The Old Testament in the Light of the Historical Records of Assyria and Babylonia"; and to these may be added Alfred Jeremias's *"Das Alte Testament im Lichte des alten Orients."* Dr. Clay is a productive student of the tablets brought from Nippur. As might be expected his book is a careful and trustworthy exposition of the chief topics in the relation of the Old Testament to the Babylonian discoverer. He treats in fifteen chapters of such subjects as the antiquity of man, the Creation, the Deluge, the period of Abraham, the Code of Hammurabi and the Mosaic legislation, the name of Jehovah, and the historical inscriptions till the time of Ezra and Nehemiah. The work is so treated that it scarcely at all duplicates the works previously published.

Another volume which partly covers similar ground[3] is by Professor Sayce.

It opens with a brief, but excellent, account of the method of decipherment of the cuneiform inscriptions, describes the nature of the inscriptions found, shows the relation of the Sumerians to Semitic people, that of the Egyptian to the Babylonian civilization, that of Palestine to Babylonia, the character of the Hittite people of Asia Minor, and describes the condition of Canaan before the Exodus. Like all of Professor Sayce's writings it is very suggestive, broad in treatment, and the conclusions sometimes rest on insufficient evidence.

Mr. Lau illustrates the rapidity of intellectual generation. He is the pupil of Drs. Gottheil and Prince, who are, or one of them, pupils of Professor Haupt, who was the pupil of Professor Schrader, who is still connected with Berlin University, and, tho in ill-health, younger than a number of other Assyriologists who might be mentioned. His volume on *Old Babylonian Temple Records*[4] is to be followed by a second completing the task. Ten years ago Columbia University bought 258 ancient inscribed tablets from Tello. They belong to the period from 2700 to 2580 B. C., when the kings of Ur of the Chaldees ruled Southern Babylonia. They are temple records, giving the account of payments to the temple of various sorts of produce, and sometimes sealed and dated. They are of value for the light they throw on the early civilization. Mr. Lau has beautifully transcribed the texts in the thirty-five plates, and has given the translation, or, at least, the substance of the texts. It is a fine piece of work, accurately done, and a credit to the university's scholarship; while it illustrates the importance to a university of having access to such original material for study. Perhaps the most valuable part of the work is the list of 291 syllabic characters in forty-one pages of autographed text, with references to their occurrence.

[4] Old Babylon Temple Records. (Columbia University Oriental Studies, Vol. III.) *By Robert Jubelt Lau, Ph. D.* 8vo, pp. viii, 130. Plates, 35. Macmillan Co. for Columbia University Press. $1.50.

A Woman's Heart. By Olive Ransom. (New York: Doubleday, Page & Co. $1.50.)

It is difficult to fancy a twentieth-century Abelard receiving letters from an American Héloïse; letters so quivering with intensity of emotion and with also a touch of classicism that would have suited well the Renaissance spirit. In *A Woman's Heart,* Olive Ransom edits such a series of letters, with sympathy and fidelity, making a companion novel to "The Lake," by George Moore. In the man's book we have the letters by the priest; in the woman's we are given, as we would expect, the woman's side of the correspondence. "The Lake," we felt, mirrored a man's heart, its moods, its mystery, its storm, its openness to Heaven; here we have a woman's heart laid bare with unsparing dissection. We do not say it is a morbid or overdrawn study; but we wonder whether, even to a priestly lover, toward whom the confession impulse may be stronger than to one less versed in psychological subtilties, a woman ever quite disclosed her inmost thoughts to such a depth? Morbid anatomy it may not be, but it is a self-revelation painful in its utter abandonment of all veiling defenses. Would the priest have loved Katherine more if she had not "given herself away" so supremely? is one of the questions awakened by the book, which tells an interesting story, altho its hold is purely psychical. The old arguments

against the theories and practices of the Roman Catholic Church, even here in America, are reiterated with amazing vivacity and freshness.

The Life and Genius of Nathaniel Hawthorne. By Frank Preston Stearns. Philadelphia: J. B. Lippincott & Co. $2.00.

The author of this new *Life of Hawthorne* comes to his task with some advantages over the ordinary biographer and critic. To a keen sympathy and with vivid admiration of the genius of our one great romancer he adds some personal acquaintance with him and his surroundings. He was a student in Harvard College, a friend of the son and an occasional visitor at the home, of the subject of this study, in those days when the returned ex-consul was tramping the woodsy ridge behind his Wayside domicile in Concord, evolving possibly the "Secret" of the mysterious Dr. Grimshawe, or perhaps arranging light and shadow for the new story, "Septimius Felton," soon to begin in the pages of the *Atlantic*, a story, however, destined to be cut short by the death of the magician. Altho a youth of eighteen could but touch the surface of the man of sixty, it was something to have looked into those marvelous eyes. After that period Mr. Stearns seems to have visited in person the haunts of Hawthorne, and to have followed up the bypaths laid open by all the writers of biography and reminiscence who have treated of the novelist and his work. The study of the literary output is close and the conclusions refreshing, notwithstanding an amusing tendency to homiletic "asides" and a sly indulgence in the sweet privilege of administering admonitory whacks on the heads of uncles and aunts who may venture to doubt that young pigs in the trough are necessarily all "innocent sucklings" of the true Shakespearean litter. There is little known of Hawthorne's early life before Bowdoin and his companionship in college with such men as Franklin Pierce, Bridge, Cilley and Longfellow, which is not taken into careful consideration in the author's study of surroundings. Little is added to what was already told in the Note Books or in Lathrop's early "Study" and Julian Hawthorne's later two or three volumes as to the life in Salem, Boston and Concord; less to what was known of the Liverpool consulate and the long residence in Italy. But many allusions in the short stories are brought home to the actual life and experience of Mr. Hawthorne—fastened on to him and his friends or his enemies, so to speak.

Pebbles

PROFESSOR—Are the Kaffirs vegetarians?
Bluff—The Heifers are, sir.—*Yale Record.*

MARK TWAIN was once asked by a charming girl to write something in her autograph album. The humorist looked thru the book and found the usual sentimental stuff, such as "Be good, sweet maid, and let who will be clever." Then he took a pen, wrote "Never tell a lie," and signed his name. This he carefully dried with the blotter, after which he added: "P. S.—Except to keep in practice."—*The Truth Seeker.*

FRESHMAN (meeting a professor in Subway)—Are those micrococci in that basket?
Professor—No.
"Spirogillimi?
"No."
"Saceromisæ cerivisæ?"
"No."
"Generatorsphorgetirimillinollinicciaan organisms?"
"No!"
"What are they, please?"
"Grapes."—*Yale Record.*

GIRLS I HAVE KNOWN.

THE liveliest girl I ever met
Was charming Annie Mation;
Exceeding sweet was Carry Mel;
Helpful Amelia Ration.

Nicer than Jenny Rossity
It would be hard to find;
Lovely was Rhoda Dendron, too,
One of the flower kind.

I did not fancy Polly Gon;
Too angular was she;
And I could never take at all
To Annie Mosity.

I rather liked Miss Sarah Nade;
Her voice was full of charm;
Hester Ical too nervous was;
She filled me with alarm.

E Lucy Date was clear of face;
Her skin was like a shell;
Miss Ella Gant was rather nice,
Tho she was awful swell.

A clinging girl was Jessie Mine;
I asked her me to marry
In vain—now life is full of fights,
For I'm joined to Millie Tarry.

—*Boston Transcript.*

Editorials

The Union Pacific Dividend Incident

FURTHER and searching inquiry is soon to be made by the Interstate Commerce Commission concerning the remarkable increase of dividends by the Union Pacific railway authorities in August last. A brief official record of the action taken was obtained at the hearing in January. Responsible officers of the Union Pacific will now be asked to testify about this transaction, which caused an extraordinary movement on the Stock Exchanges here and abroad, bringing enormous profits to some at a cost of considerable losses to others.

We recently analyzed the sale of $50,000,000 worth of Illinois Central stock to the Union Pacific by three of the latter company's directors and a banking firm, pointing to assertions in the press that the sellers realized a profit of several millions. This memorable increase of dividends is regarded by many as a transaction which shows how it is possible to enlarge "swollen fortunes" by leaps and bounds, without relying upon the comparatively slow growth that is derived from ordinary interest rates of 4 or 5 or 6 per cent.

It was expected by the public at the beginning of August last that the Union Pacific dividend rate would be increased (from 6 per cent.) and that a first dividend on Southern Pacific shares would be declared, owing mainly to a considerable increase of earnings. Having paid 4 per cent. for several years, the Union Pacific had increased its rate to 5 per cent. in October, 1905, and to 6 per cent. in April, 1906. The public reasoned that in August there would be a further increase to 7 per cent. and that the first dividend upon the controlled Southern Pacific might be at the rate of 4 per cent.

There was a meeting of the Union Pacific board on Wednesday, August 15. But, so far as the public could learn after adjournment, no action concerning dividends was taken. It was known, however, that the subject of dividends had been referred, at a meeting on July 19th, to the powerful executive committee, of which President Harriman is chairman. There was no announcement of dividends on Thursday. Therefore, according to common reports, some holders of the stock sold out and speculators made what are called "short" sales for a decline. Their action, however, did not prevent an advance of about $4 in the price during the two days. Somebody was buying the shares.

On the morning of Friday, the 17th, the unexpected announcement was made that the Union Pacific board had increased the company's dividend rate, not to 7 per cent., but to 10 per cent., and that an initial dividend on Southern Pacific at the rate of 5 per cent. had been declared. That day, in a crazy stock market, with enormous transactions (including purchases of more than 1,000,000 shares of the two Pacifics), the price of Union Pacific was increased $20, and at the close of business nearly $16 of this advance was retained. There was a gain of more than $5 in Southern Pacific. On Saturday there were further advances, with wild scenes on the Exchange. Monday (the 20th) saw a greater volume of business than had been known for some years, but the Pacifics ceased to advance. The explanation of expert observers was that the speculators who had been operating upon early and exclusive information as to the dividends were selling their holdings to a trustful public and taking their profits.

We shall not follow the course of the market after that date. But it may be pointed out that Union Pacific, which was quoted at $144 on July 19th (when the subject of dividends was referred to the executive committee), had risen to $161¼ on August 15th, was sold at $185 on the 18th, and touched $185¾ before the reaction on August 20th. After some vicissitudes, the stock sold at $195 in the first week of September, declined to $180 at the end of the year, and is now quoted at about $177. Southern Pacific advanced from $69 on July 19th to $92½ on August 20th.

At the hearing before the Commission

in January, it was shown by the records that action upon the dividends was really taken by the board on Wednesday, August 15th, but that the fact was withheld from the public at the suggestion of President Harriman until six absent members "could be notified." By resolution, the date of announcement was left to the discretion of the executive committee. On the following day this committee (Messrs. Harriman, Stillman and Lovett being present) decided to wait until Friday morning. Of course, it had been feasible to notify the absent members by telegraph on Wednesday. Speculators in Wall Street have been saying that delay was needed to facilitate the accumulation of stock for an "inside" pool before the great advance of price which would surely be caused by an announcement of the extraordinary and unexpected increase of dividends.

If one may trust the reports of the daily newspapers of New York at the time, there was a prevailing belief in and about the Stock Exchange that enormous profits had been realized by a pool in the interest of influential officers of the Union Pacific. In the headlines of one prominent and conservative journal were the words: "The insiders made millions; perhaps Harriman made $10,000,000." Another's headline was: "Brokers say Harriman alone won $10,000,000." In all the local papers, and in dispatches to papers elsewhere were discussions of the current gossip that pools made by officers of the company had taken great gains. Editorial articles in conservative financial journals were full of sharp criticism, evidently suggested by a belief that these stories about speculation in the shares, assisted by delaying the announcement of dividend increases, were true. It was pointed out by some that upon a pool of 400,000 shares of Union Pacific, accumulated before July 19th, there could have been realized a profit of from $30 to $40 a share before the end of August, or from $12,000,000 to $16,000,000; also that a profit of only $20 on such a pool completed some time after July 19th would have amounted to the comfortable sum of $8,000,000.

In view of the world-wide reports and comments of this character in the latter part of August, and the occasional repetition of them since that time, Mr. Harriman and his responsible associates should make reply to what is regarded by many as a charge of serious import against the financial management of a great American railway system. The approaching resumption of the Commission's investigation opens the way for such a reply, with all the explanations which may seem to be required. There was an opportunity for such speculation as the press reporters and critics have had in mind. But it does not follow that advantage of the opportunity was taken by officers who should have avoided speculation under such conditions. We hope the officers in question will show clearly in their statements before the Commission that they have had no interest in such pools and speculative operations as those with which the names of some of them have been connected in newspaper reports.

Mr. Mallock on Socialism

A RAPIDLY growing interest in Socialism, which seems to be about equally distributed among those who sympathize with it and those who fear it, is being freshly stimulated by the interesting lectures which Mr. William Hurrel Mallock is delivering under the auspices of the National Civic Federation. This organization, as some of our readers doubtless know, and all should know, is a body of eminent men representing capitalistic interests, the American Federation of Labor and the general public, and having for its objects a general exchange of differing views and a comprehensive study of industrial conditions. It was a happy thought of the Federation to import Mr. Mallock, long known as a brilliant and versatile writer on many themes. His lectures on Socialism have been given first at Columbia University. They will be repeated at Harvard and elsewhere.

President Butler, in presenting Mr. Mallock to his first American audience, introduced him as "a novelist." We are not quite sure that this designation is accurately descriptive. Only one of Mr. Mallock's novels—that very charming story, "The Heart of Life," is primarily art for art's sake. His other fiction, of

which "The New Republic" is best known, is social satire in story-book form. He has written much, however, that is not clothed in artistic disguise. His first important essay, "Is Life Worth Living?" was ostensibly a philosophical discussion. His most pretentious work, "Aristocracy and Evolution," professes to be the first true system of sociology ever published. In the judgment of its author it demolishes Herbert Spencer, not to mention August Comte, and builds the enduring structure which their genius was unable to raise. Mr. Mallock has written also statistical books on "Social Equality" and "Classes and Masses." He must be recognized, therefore, as a man of wide outlook, whose presentation of so large a subject as Socialism calls for respectful consideration.

Nevertheless, those who have awaited his lectures in the expectation of hearing something distinctly new, or of seeing the socialist discomfited, have undoubtedly been disappointed. Mr. Mallock has acquainted himself with the theories of Karl Marx and of the Fabians, and he has cleverly discharged the easy task of exposing their errors, both of premise and of logic. But he has not shown a thoro training in economics, or a due familiarity with the best economic literature of modern times. For example, justice to one of our most brilliant American writers, General Francis A. Walker, requires that the true source of Mr. Mallock's chief contention should be pointed out. The economists of Ricardo's day, and even those of John Stuart Mill's day, were in the habit of recognizing three productive factors, namely land, labor and capital. The major premise of Mr. Mallock's argument is the assertion that more important than mere labor is that peculiar gift which may vaguely be called "ability," and which in the industrial world finds expression in invention, including successful organization. Not only is this discovery of Mr. Mallock's not new, but for thirty years it has been a commonplace in the political economy class-room. It is the cardinal doctrine of Walker's epoch-making work on "The Wages Question," and of his economic text-books.

Nor has Mr. Mallock been more happy in his general conception of Socialism and its indictment of modern industrial society. Apparently, he has not followed the later developments of socialistic thought as set forth, for example, in the writings of H. G. Wells, John Spargo and James Mackeye. He is conspicuously in error in assuming that socialists wish to reward all men equally, irrespective of productive genius. If he wishes to tackle an essential socialistic proposition, he should tell us what objection he has to the contention that the mere ownership of capital, apart from any effort put forth by productive genius, is not an adequate ethical basis of income. If he should address himself to this task, he would discover that the most thoughtful and really serious criticisms of Socialism have been made in the very university where he put forth his unformed ratiocination. The one man who has really gripped this problem from an anti-socialistic point of view is Columbia's own distinguished economic theorist, Prof. John Bates Clark.

Mr. Mallock's lectures will neither convince the socialist nor undermine the individualistic faith of the non-socialist. The most just criticism that can be passed upon them is to say that their intellectual and moral quality is indistinguishable from that of his essay, "Is Life Worth Living?" in which he demonstrated to his own satisfaction that life is not worth living outside the safe fold of the Roman Catholic Church. Yet his lectures are bound to do a vast amount of good. They are stimulating. They raise questions. They make people think. And that, after all, is the main thing.

Newspapers' Sensations and Suggestion

Much has been said during the past week with regard to the possible evil effects of publishing the details of a sensational murder trial involving many criminal suggestions besides those of the murder itself. In spite of the fact that at the first glance most people would condemn the spreading broadcast of such material, there has been an unexpected division of opinion with another view shared by many good people that such publicity may be a source of good rather

than evil. The plea is, of course, that crime is held up as receiving its due reward even in this world and that the effect upon people's minds cannot but be to bring home to them the conviction that evil brings upon itself inevitably its own punishment in due time, and that this will surely be a deterrent from wayward courses. Many of the newspapers have insisted rather emphatically on this view, but, of course, they are interested parties and their opinion can have little weight. One of the arguments used by a prominent editor is the rather curious assertion that since so many people are deeply interested in the proceedings, it must be beneficial to them to have the opportunity to read them.

Such views look at but one side of the case. It is probable that if all men were perfectly normal there would be no good reason for not allowing them to gloat over all the criminal details of a case of this kind. If men were normal, however, there would be very little question of their caring to do so, since most of the interest in such criminal proceedings is due to a distinctly morbid curiosity. It is for this reason that the subject requires careful consideration on the part of all those who are interested in preventing crime. The most important thing in present day medicine is the influence of suggestion. Persons may be led to do many things that are quite disagreeable to them under ordinary circumstances by a series of suggestions. They may even be tempted to throw off morbid influences that are weighing them down and live a happier and more cheerful life, quite apart from many ills, from which they thought only a short time before that they were unescapable sufferers.

It is this question of suggestion that is most important in the matter of allowing people to read sensational details of crime of any kind. Whatever of natural abhorrence there may be from such evil is gradually lessened, and familiarity breeds contempt for the evil-doing hitherto so deterrent. This is true not alone for sexual crime, but for nearly all forms of criminality. It is well known now that suicides, as reported in the papers, constantly furnish suggestions for further unfortunate beings to put an end to their existence. If some peculiar form of suicide is given wide publicity in the newspapers, then others of similar nature done in imitation of it will usually turn up at various places thruout the country during the course of the next few weeks. If a new or unaccustomed poison is used, efforts are made to obtain this, some of them successful, and the result is further newspaper reports to be suggestive for still further victims, until the novelty of the procedure has worn off and it ceases to be strikingly suggestive or some newer method is reported which takes its place. This is not a matter of imagination or theory, but can be noted at any time if a little attention is paid to the collation of suicide statistics.

There is a general agreement now that the reason why suicides are increasing very rapidly among younger people during the last twenty-five years (the number of youthful suicides has more than trebled in that time) is that young folks between fifteen and twenty read the newspapers much more commonly now than used to be the case a generation ago, and are affected by these morbid sensational details to such a degree that whenever anything serious, or rather that they think serious, happens to disappoint them, they rather readily have recourse to self-destruction. Even more true than with regard to suicide is the effect of newspaper reports in the matter of the double crime of murder and suicide. These are not only increasing in number every year, but the average age at which they are committed is becoming less and less, because as students of the psychology of young folks declare, the suggestive influence of reading of previous cases finally overpowers the minds of those who have less mental resistance to the hardships and the trials of life, be they imaginary or real.

If the power of suggestion is so great with regard to murder and suicide where the natural abhorrence might well be expected to be an excellent protective, what is to be said of sexual crimes with regard to which there is an unfortunate leaning that constitutes one of the saddest features of poor human nature. There is no doubt at all that suggestion plays a large rôle in bringing about the commission of unusual crimes of this kind. It is idle to talk of the contempla-

tion of the punishment of such crimes as forming a barrier against them in the minds, especially of the young and of unstable individuals. Familiarity with them only enhances the morbid curiosity that tempts to abnormal experiences in such matters and undoubtedly predisposes to serious danger of yielding to even light temptation. All this has been well recognized by common sense before, but it is confirmed now by the advances in modern psychiatry. This furnishes the best reason why our newspapers should not give the details of crime, and especially not of sexual crime, for while to a few such reports may be deterrent, to the great many they will be an actual incentive—a suggestion that will tend to work itself out into actuality.

Child Labor and the Constitution

SENATOR BEVERIDGE this week defends in THE INDEPENDENT his bill to protect children against the greed of corporations engaged in manufacture. His bill proposes to do it by forbidding interstate commerce to child-made products. The purpose is good, and, on the face of it, the method seems adequate and proper.

But the Constitution is thrust at us. We are told that the bill interferes with the constitutional rights of the States to manage their own affairs and have free commerce with other States. We respect and honor the Constitution, but we do not like to see its provisions strained to protect individual or corporate oppression.

Constitutionally the right to forbid interstate commerce in child-made products goes on all fours with the right to control or restrict any other form of industry which exists under a State charter. For example, the Erie Railway has a New York charter, but it passes thru New Jersey and Pennsylvania. Accordingly, the United States law controls and restricts its powers, tells it to use safety appliances, and puts it partly under the control of the Interstate Commission. The New York Central Railroad is entirely within the limits of the State, and the national law has no control over it until it does its work beyond those limits. As Senator Beveridge shows, Congress in various cases has forbidden the passage across State lines of certain sorts of goods, not simply of lottery tickets dealt in by a company in New Orleans, but, for example, certain gold and silver ware, and uninspected foods and meats. Now, if it is constitutional to forbid the Meat Trust in Chicago to transport uninspected meats from one State to another—and such power is abundantly proved by numerous decisions of the Supreme Court—then there is no constitutional difficulty about prohibiting child-made products.

It is interesting to see the protest against the passage of the Beveridge bill in certain quarters, and especially in the Democratic South, on the ground that it interferes with State rights; and the Democratic party is supposed to be sensitive on State rights. But the Democratic platform of 1900 asked that this very power over interstate commerce be used for the annihilation of the trusts. Mr. Bryan, who was the candidate at that election, has not forgotten that fact, and he calls attention to it in *The Commoner* and asks:

> "If the power can be exercised to protect independent industries from the conspiracies of the trust magnates, can it not be used to protect the children from being dwarfed and stunted by early toil? The Constitution was made for the people, but the predatory corporations have converted it into a bulwark for the protection of all their schemes. . . . The children must be saved, and the Beveridge bill offers a safe and effective remedy for the cruel and barbarous system of child slavery which has grown up in this country."

We commend this utterance to Mr. Bryan's Southern friends, and we hope that they will not treat this pertinent reminder and advice as they did his recommendation for the public ownership of the railroads. That they called Socialism.

An Irish Bill

THE British Cabinet will present a bill for the establishment of a local parliament for Ireland, and the House of Commons will pass it, and the House of Lords will, if not frightened out of their prejudice, reject it. But the rejection will be one more of the sins of the Upper

House which prepare the way for its mending or ending. It may be delayed until after another appeal to the country, but an Irish Parliament is sure to come before long, for the country has been not a little educated since Gladstone's futile attempt.

Do our readers comprehend what a change an Irish Parliament will make in the British Constitution? It will be revolutionary. At present Great Britain has no written constitution, and nothing that corresponds to our principle of State rights. There stands no authority between the Imperial Parliament on the one hand and the city councils on the other, for the counties cannot be said to have legislative power. There is nothing in Great Britain that corresponds to the General Court of Massachusetts or the Legislature of New York State.

But there will be when Ireland has a Parliament, to be followed surely by Parliaments for Scotland, Wales and England. The privilege given to Ireland, Scotland and Wales will also ask. Ireland will then correspond, so far as local government goes, to one of our States, and its Parliament will correspond to one of our legislatures. Still further, there will then be a written constitution, for the law which devolves authority on the Irish Parliament and also limits its powers, will do precisely what our Constitution does, even if it be called simply an act. It will be as permanent as our Constitution, and will be held as sacred, and will be interpreted, as ours is, by the supreme judiciary.

It is a question for the future to determine what is the superior value of a written constitution. Great Britain has had none; France as a republic has none. But neither country has had to balance State rights against central authority, for there were no States and no State rights. What is sure to come in Great Britain is an argument for subordinate, yet self-governing, States, under a central government, and for a written constitution. And yet a written constitution, which can be amended with great difficulty, is a bar at times to progress, if not a menace. It compels amendment by strained interpretation by the courts, as we see in the interference with State authority by the interstate legislation of Congress.

We are not of those, however, who anticipate danger by the intrusion of the central government into the domain of State legislation. Amendment by interpretations will go no faster than the people desire and is best for the country. We deprecate such extreme language as we see in *The North American Review* in an article on what it regards as the threatened obliteration of State lines by the President and his Secretary of State. It says:

> "We now daily behold open and avowed subversions of those fundamental principles [of the Constitution] by neither ineffective 'political dreamers,' nor even a political organization, but by an active, able and resolute clique, which, under most aggressive leadership, holds absolute control of one arm of the Government, successfully coerces another, and insidiously endeavors to influence the court of last resort."

This is nothing less than wild ranting. If the Executive department "holds absolute control of one arm of the Government," that is precisely what the people elected it to hold and what the Constitution gives to it. It is not true that the Executive "successfully coerces" the legislative branch. We have just now in the new Santo Domingo treaty an example—and there are many—in which the Executive bows, as it should, to the will of Congress. Nor is it true, whatever criticism may have been made by the President, that he "insidiously endeavors to influence" the Supreme Court.

The American people have been taught to believe in constitutions. Neither the President nor Secretary Root would dream of trying to wean them from this faith. We are daft on constitutions. Not only does every State need a constitution, but every local society and every debating club must have one to quarrel over. So long as we choose to be governed and limited by a written Constitution it ought to be made not impossible nor very difficult to amend it, because with changed conditions we must have either amendment or forced interpretation. As to the danger and wrong of the latter we commend the reader to E. Parmalee Prentice's late study of "The Federal Power Over Carriers and Corporations."

The Theological Flurry in England

Our "Undistinguished Heretic" was anonymous, and yet he has made no small flutter by his "Confessions." We do not thank *The Westminster* for supposing him to be an editorial "fake." We do not thus deceive our readers. He is the genuine living pastor of a church connected with one of our principal evangelical denominations. The flutter which his confession of divergence from the creeds has made among our readers is small compared with the flurry created in England by the statement of his very liberal faith made by one of the most distinguished preachers of London, the Rev. R. J. Campbell, pastor of the City Temple.

To be sure, in the case of Mr. Campbell there can be no accusation of concealment and hypocrisy. The only moral question that is raised is as to whether he has the right to remain in the pulpit and fellowship of a denomination which is supposed to have a definite creed with which he disagrees. But there is a very general disagreement with his teachings, and those who defend him defend chiefly his right of liberty. That he teaches the spirit and character of Christ no one questions.

With Mr. Campbell's theology we do not so much make complaint, as with the philosophy which underlies his theology. It is all well to slough off the excrescences of theology, to show that this and that doctrine, of the Atonement, for example, or the decrees, is not in accord with the character of God; but it is another and bolder thing to attempt to make a new theodicy by striking at the very foundations and trying to create a new philosophy which can never approve itself to the common sense of the average man. Such is the philosophy which identifies body and mind, whether in a common physical substance, all matter; or whether it denies separate reality to matter, making it a phase or conception of mind. So the effort which Mr. Campbell has made to substitute "immanence" for omnipresence, and to identify God with man, must be to the ordinary mind meaningless. It declares man and matter to be nothing else than God partitioned off, and so this essential Pantheism undermines human responsibility, and, in the teachings of Mr. Campbell, very definitely eliminates turpitude out of sin; so that, as he says, the lowest vices and most hideous crimes are a blind and mistaken searching after the divine in us. We are not surprised that such teachings are sharply criticised, and that not only by conservatives, but by the most liberal of theologians. It is the philosophy they object to. It is not by such help that faith is supported. To save a tree you must not cut off its roots; it must be pruned otherwise.

Mr. Campbell says: "Our being is the same as God's, altho our consciousness of it is limited." Such a statement cannot possibly be proved, for it could be proved only by the consciousness, which is said to be limited. It is against all the sense we have, against our free will and our consciousness of sin. But Mr. Campbell has the courage to follow his doctrine of the identification of man with God to its most frightful extreme. To quote his language on sin is to condemn it. He is thus quoted in a sermon of a year ago:

> "Sin itself is a quest for God—a blundering quest, but a quest for all that. The man who got dead drunk last night did so because of the impulse within him to break thru the barriers of his limitations, to express himself, and to realize the more abundant life. His self-indulgence just came to that; he wanted, if only for a brief hour, to live the larger life, to expand the soul, to enter untrodden regions, and gather to himself new experiences. That drunken debauch was a quest for life, a quest for God. Men in their sinful follies today, and their blank atheism, and their foul blasphemies, their trampling upon things that are beautiful and good, are engaged in this dim, blundering quest for God, whom to know is life eternal. The *roué* you saw in Piccadilly last night, who went out to corrupt innocence and to wallow in filthiness of the flesh, was engaged in this blundering quest for God."

We trust that such language was a rhetorical extravagance which, altho the author printed it, he would not now defend; but it is the unguarded product of the fantastic philosophy which, in identifying God and man, identifies right and wrong, and comes to the insane conclusion:

> "To say of shame, What is it?
> Of virtue we can miss it;
> Of sin we can but kiss it,
> And it's no longer sin."

Mendeleef

Why did not the cable report to us the death of the Russian chemist Mendeleef, the most famous theoretical chemist in the world, a man whose prophetic discoveries rival the most astonishing forecasts of astronomy in the finding of the planet Neptune? It was Mendeleef who formulated the law which arranged elements in groups by their atomic weights, and told us where there were gaps that needed to be filled and foretold what the properties of the missing elements would prove to be. And gallium, scandium and germanium were found just as he had foretold, with their proper atomic weights and their properties, corresponding to those of aluminum, boron and silicon. When later the inert gases, argon, helium, etc., were discovered, they were found to fit exactly in places in the periodic scheme of Mendeleef's law. Some of his later and even more startling theoretical work cannot yet be verified, as his famous law has been by subsequent discovery, but as theory it is very interesting. In 1902 he published a remarkable essay in which he suggested that below the inert zero group consisting of the chemically inactive gases helium, neon, argon, krypton, and xenon, there are two elements not yet recognized having a lower atomic weight than hydrogen, and the lowest of the two he supposes to be the ether. He could not believe the ether to be really an imponderable fluid, but supposed it to have an atomic weight inconceivably small, and so high a velocity that its particles penetrate and pervade all other substances, so that its mass in a given amount of other substances could not be ascertained. Politicians and society people do not know much of Mendeleef, and few but the chemists paid much attention to him when, nearly thirty years ago, he visited this country, but his name will rank with the highest of the great men of the last century.

Freedom and License

The President would like to forbid the use of the mails to newspapers that print filthy and indecent details of court proceedings. A bill has been introduced into Congress empowering the President to exclude such matter from the mails. There is a great deal of public sentiment in support of such exclusion, and from the medical standpoint we have treated of this subject elsewhere, showing what is the effect of suggestion on weak minds and those not so weak. In Kentucky indictments have been brought against four newspapers which have violated the law forbidding the sale of any "obscene, lewd, disgusting, filthy or indecent book or newspaper," or any newspaper "principally made up of criminal news, police reports, or accounts of criminal deeds." Of course one must be careful not to infringe on the decent liberty of the press, but the court testimony of ravishments and seductions is not decent, and no decent family would willingly receive such reports into the home. Liberty of the press is good, but there is a limit to it, just as there is a limit to the nudity allowed in public places. There is the same difference between liberty and libertinism that there is between freedom and lawlessness.

The Loss of the "Larchmont"

Here is another case of a terrible fatality by the loss of a coast steamer plying from New York. The "General Slocum" was destroyed by fire, the "Larchmont" by a collision on a fearfully cold night. No one was found at fault or punished for the loss of the "Slocum" and probably no one will be for that of the "Larchmont." The reason is that the people that make the laws—that is, all of us—are to blame quite as much as those whose fault cost 145 lives. We have no suitable control or inspection of these vessels. It would be something if what inspection we have were strict and frequent, which it is not, but there is no assurance even that there shall be a plenty of life preservers. But there are other considerations. The "Larchmont" was an old and cheap boat, without watertight compartments, run at a cheap rate, and without experienced and competent crew. We know nothing about the competency or character of the officers, except that they were more successful in saving themselves than in saving their passengers. It does not seem to have occurred to the captain to have been the last to leave the vessel. He

could not have had the professional spirit of the German captain who, a few weeks ago, committed suicide when he had lost his steamer on an island in the West Indies. The crew were perfectly worthless, picked up from day to day on the dock. We need more laws providing how many able seamen shall be on every coasting vessel.

By the Favor of Schmitz

We can conceive of hardly a more humiliating condition politically than that which required the assent of the Mayor and School Board of San Francisco to the settlement of an international difficulty with Japan. They have held up the President, the treaty-making branch of Congress and Congress in both branches, and the action taken by the Senate and to be approved by the House, suggested by the President and Secretary of State, was made possible only because Schmitz and his fellows came on from San Francisco and permitted it. By the settlement on Monday approved by the House, after a treaty with Japan by which she will give passports only to a selected class of emigrants, the President shall have the power to exclude those having passports if Japan gives them indiscriminately, "to the detriment of labor conditions" in this country. On this condition, by the grace of Schmitz, San Francisco will let Japanese children under sixteen attend school with white children. It is a disgrace to our country that one city, or, rather, the labor unions in it, should be able to bring the country to the verge of war and then dictate terms of peace. If this is constitutional the Constitution should be changed.

The Brownsville Inquiry

The investigation of the Brownsville affair by the Senate Committee has been one-sided thus far, but it goes very far to show that the soldiers should have been tried by court-martial, where all facts could have been carefully tested. It looks very much as if not a single negro soldier fired a gun, and we shall be pleased if this is proved; not because we choose that others should be found guilty, but because the soldiers have had a better character than that borne by the Mexican and other white roughs in Brownsville. It is clear that Major Blocksom's investigation was very incomplete and unsatisfactory. It is testified that the guns were all accounted for and also the ammunition, and that the guns were all clean, and that it would have been impossible to clean them after half a dozen shots in less than fifteen minutes, and then with good light. There was no opportunity for the men to clean their guns after the firing, for they were all the while from that moment under the eye of their officers, and so situated that it was impossible for them to clean the guns before they were put in their racks and locked up, after which came the inspection, and all were found in clean condition. The witnesses have apparently satisfied every member of the committee that there was no opportunity to get any surplus ammunition, and no cartridges were missing. The testimony also shows that empty shells and exploded cartridges could easily have been secured, and that plenty of Mexicans and others wore the khaki uniform. The conviction grows that others than soldiers "fired up the town," and their bullets whizzed over the soldiers in camp. Certainly the soldiers have made a good impression by their testimony thus far.

The Suffragettes

That respectable English women should be so lacking in sense that they should imagine that they would get the suffrage by making a riot is past American comprehension. We cannot imagine the leaders in the movement here of a generation ago, or those of today, storming the Capitol, fighting with the police, and begging to be taken to prison. That does not look like the decent ways of Lucy Stone or Mrs. Stanton or Susan B. Anthony. That is not the way that female suffrage has been gained in Kansas, Colorado, Wyoming, Idaho and Utah. In those States the women have debated the matter before the people, have appealed in legal ways to the legislatures, have acted like law abiding citizens as well as ladies, and have won their point. But in London they have in a great crowd tried to force their way into the Houses of Parliament, have beat themselves against the gates, have de-

clared that if they could force the police to arrest them and send them to prison, then Parliament would grant their wishes. This is quite another thing from the passive resistance which had its influence in the last British elections. Those Non-conformists did not fight the police; they simply refused to pay a part of their assessed taxes, and went to jail quietly. With these wild women it is a case of mob craze, which reminds us of the "rout that made the hideous roar" on the banks of the Hebrus when Orpheus perished at the hands of mœnads.

The American Bible League is distributing to the press long extracts from a lecture by Prof. George F. Wright, in which it is said:

> "In the realm of archeology Hommel and Sayce, two of the most eminent authorities, were compelled by their studies to abandon the destructive school and become defenders of the Old Testament traditions."

We know well that Professors Sayce and Hommel are far from being "destructive" critics, but we would like to have our attention called to the evidence that supports the position implied by the statement that they have "become defenders of the Old Testament traditions." We do not recall any proof that they defend the historicity of the Garden of Eden, the creation of Adam and Eve, the Fall, the antediluvian patriarchs, the Flood, or the escape of Lot from Sodom and the death of Lot's wife.

The South Carolina legislature has voted to end the State dispensary for the sale of liquors, and will put in its place the excellent local option law which has done so much good in the States where it is in operation and which can be executed by public sentiment. Other States have, at one time or another, Massachusetts, for example, confined the sale of liquors to State agents, but with narrow restrictions, while the South Carolina dispensary sold liquor to anybody that wanted it. This question of State monopoly, whether that in South Carolina or in Russia or Sweden, makes drinking easy, invites scandals and corruption, and we have probably seen the last of it in this country.

It ought, by this time, to be clear to the blindest that the French Government does not desire to overthrow Christianity or the Catholic religion. It is simply determined fully and definitely to separate the Church and the State. It does not desire to shut the faithful out of the churches, but desires that they shall have the full use of their places of worship to conduct religious services just as they please. So the Government accepts one after another the requests of the bishops that they may fasten their authority and exclude the laity from all rights of property or worship. If the Government were the enemy of religion it would look sardonically on the result.

This time, once more, as in the Philadelphia case, it was a model old man, who had no vices, who was a prominent churchman, too much trusted to be watched, that has gambled in investments and robbed the New Britain bank of an immense sum. Even Presbyterian elders and Baptist deacons need watching as well as the humbler employees for whom we provide cash registers or who are required to ring up the fares. This does not mean that proved character is no safeguard, but it does mean that even that may fail, and that the haste to make sudden profits is enough to cause the fall of the most esteemed.

We have received from Lieutenant-Commander William S. Sims, of the United States Navy, a long article which we regret we cannot print, in reply to Park Benjamin's article, "The Shout for 'Big Ships,'" in our issue of January 31st. Commander Sims controverts Mr. Benjamin's points serially, and particularly meets statements which he regards as traversing his personal good faith in his reply to Captain Mahan. As he wishes his article published in full or not at all we are hardly at liberty to say anything further than that he appears to show that he took no advantage of Captain Mahan in this matter.

Insurance

Embezzlements in 1905 and 1906

EMBEZZLEMENTS during the year 1906, compared with 1905, as indicated by figures given by the Fidelity Department of the Fidelity and Casualty Company of New York, are as follows:

	1906.	1905.	Increase.	Decrease.
Banks and Trust Companies	$12,835,215	$6,816,729	$6,018,486	.....
Benevolent Associations	365,538	542,869	.....	$177,331
Public Service	1,734,720	1,950,272	.....	215,552
General Business	2,376,298	1,272,635	1,103,663	.....
Insurance Companies	141,979	55,835	86,144	.....
Transportation Companies	240,866	136,824	104,042	.....
Court Trusts	255,553	798,667	.....	543,114
Miscellaneous	933,540	1,049,705	.....	116,165
Net increase, $6,260,173.	$18,883,709	$12,623,536	$7,312,335	$1,052,162

It will be seen that the aggregate amount of defalcations in 1906 exceeds that of 1905 by almost 50 per cent. It offers at least one argument in the negative to the oft repeated query, "Is the world growing better?" There must have been some truth in the recent statement of a Massachusetts bank commissioner when he said that there was, on the average, a case of bank defalcation for every day in the year. As Mr. Cleveland says, defalcations do occur with "astounding frequency."

Cheap Life Insurance

JOHN M. TAYLOR, the president of the Connecticut Mutual Life Insurance Company, of Hartford, Conn., in his report to the members of his company for 1906 writes in part as follows:

"Many men who know nothing of the business of life insurance, which involves the interests of twenty millions of the American people, and nothing of the responsibilities of its administration, have, within the last two years, filled the world with their vociferous preachments about *'cheap life insurance.'* What is it? It is the insurance that, when age comes on apace or death knocks at a man's door, has nothing to pay, and nothing to say to the summons but charity for the family and insolvency to the estate. It is the insurance which has been had in the assessment companies which mark the long and tragic history of the attempt to insure men's lives without a reserve and at an increasing premium with increasing age. It is the insurance to be had in the multitude of mushroom companies springing up on every hand, with specious promises 'special contracts,' subsidiary annexes, and limitless expenditures, sops of stock and bonuses and official positions, with demagogic appeals to cupidity and ignorance, and certain of ultimate disappointment and disaster to all save their ingenious and persuasive exploiters and promoters. The only cheap life insurance is SAFE life insurance; and that which is both cheap and safe cannot be created by statute, nor made good by theories or expedients."

THE Metropolitan Life Insurance Company of this city has purchased all of the industrial business of the Columbian Life Insurance Company of Boston, Mass. About sixty thousand policies and $7,000,000 were involved in the transaction.

GAGE E. TARBELL has offered his resignation as second vice-president of the Equitable Life Assurance Society to take effect on March 1st, and the resignation has been accepted. Mr. Tarbell has a record of twenty-five years of service with the Equitable. He will join with Timothy L. Woodruff in Long Island realty development.

THE Circuit Court of Toledo, Ohio, has affirmed the Common Pleas Court decision that insurance cannot be collected by the heirs of a beneficiary who is responsible for the death of the person insured. This decision was handed down and announced last week in the case of James Mack, Sr., against the Ladies of the Maccabees of the World. Mack's son, James Mack, Jr., killed his wife and subsequently committed suicide. His victim carried insurance in the order of the Lady Maccabees in favor of her husband. A suit was instituted by the elder Mack as the next heir of his son to collect the insurance on Mrs. Mack's life. It was held by the court that the beneficiary in his killing the insured party, deprived his heirs, as well as himself, of any rights to the insurance.

Financial

The Currency Bill

From the Senate's committee on Finance the two amendments to which we referred last week were reported on the 12th, attached to the House bill which provides for an increase in the number of gold and silver certificates of small denominations. The limit for withdrawals of national bank circulating notes in any month is increased in one of these amendments from $3,000,000 to $9,000,000, and not to $12,000,000, as was at first proposed. In the other, the existing restriction concerning the deposit of current customs revenue in the banks is removed. While no provision is made for any temporary increase of circulation at times when conditions call for it, the propositions are steps in the right direction, and they ought to be enacted at the present session.

A Curious Case

There is much that is mysterious and unexplained in the disappearance and defalcation of William F. Walker, treasurer of the Savings Bank of New Britain, in the Connecticut city of that name. At last reports, the bank's loss was $565,000, and there was to be added about $50,000 of the funds of the Connecticut Baptist Convention, of which the missing man was treasurer. Walker was last seen in New York. Telegrams bearing fictitious signatures but probably written by himself were received from New York in New Britain on Sunday, the 10th, saying that he had been killed by a street car. To those who had known him for many years it seemed incredible that he could have been dishonest or could have indulged in speculation. He was sixty-three years old and a veteran of the Civil War, and for thirty years he had been treasurer of the bank. The son of a Baptist clergyman, he was himself deeply interested in religious affairs. A deacon of his church in New Britain, he had for many years been superintendent of its Sunday school, and in that office had been accustomed to advise young men that they should avoid speculation. In his habits he was apparently most exemplary. He lived modestly and simply, devoting substantially all of his time to the bank, his family, and several religious or philanthropic organizations of which he was secretary or treasurer. For a time he kept a horse for family use, but his economical tendencies soon led him to dispose of it. His annual vacation was brief and inexpensive. Evidently this is no ordinary case of defalcation and flight. According to the published reports it seems inexplicable to his family and his business associates except upon the supposition that he suddenly became insane. All the missing securities were in the bank three months ago.

....The dividend of the Chicago People's Gas Light and Coke Company, which was cut down when the price of gas was reduced by legislation to 85 cents, has been restored to the old rate of 6 per cent.

....At the recent listing of the stock of the Mackay Companies (which controls the Postal Telegraph and Commercial Cable companies) it became known that this corporation is the largest stockholder in the American Telephone and Telegraph Company, and has a considerable interest in a large number of the subsidiary Bell companies.

....Records were broken by the United States Steel Corporation in the December quarter and also in the full calendar year. Net earnings for the quarter were $41,744,764, making $156,619,111 for the year, or a sum exceeding the previous record (1902) by $23,000,000. Another record was broken by the unfilled orders on hand at the end of the quarter, these amounting to 8,489,718 tons.

....Charles W. Morse recently offered about $20,000,000 to the New York, New Haven & Hartford Railroad Company for its steamship lines, which he desired to add to his large coastwise combination. The company's directors, on the 9th, by unanimous vote, declined the offer, upon the ground that the steamship lines were essential to the symmetrical development of the company's system.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Roosevelt's Address at Harvard

The President had a busy day in Cambridge and in Boston on the 23d. In the morning he acted as godfather at the christening of the son of a Rough Rider. At Harvard University he met several of his classmates, attended receptions, delivered a long address, and in the evening was present at the initiation of his son as a member of the Porcellian Club. At the beginning of his address at the Harvard Union, his remarks about athletic sports were sharply at variance with the recently published opinions of President Eliot. The latter had said that it would do no harm to discontinue football, basketball and hockey at the University. Basketball was "too rough." It was the duty, he added, of colleges which had "permitted monstrous evils to grow up" in connection with athletic sports to "purge themselves of these immoralities and to help the secondary schools to purge themselves also." Mr. Roosevelt, commending the athletic spirit at Harvard because it was essentially democratic, urged that intercollegiate sport should be encouraged, and continued as follows:

"As I emphatically disbelieve in seeing Harvard or any other college turn out mollycoddles instead of vigorous men, I do not in the least object to a sport because it is rough. Rowing, baseball, lacrosse, track and field games, hockey, football, are all of them good. Moreover, it is to my mind simple nonsense, a mere confession of weakness, to desire to abolish a game because tendencies show themselves or practices grow up which prove that the game ought to be reformed. Take football, for instance. The preparatory schools are able to keep football clean and to develop the right spirit in the players without the slightest necessity ever arising to so much as consider the question of abolishing it. There is no excuse whatever for colleges failing to show the same capacity, and there is no real need for considering the question of the abolition of the game. If necessary, let the college authorities interfere to stop any excess or perversion, making their interference as little officious as possible and yet as rigorous as is necessary to achieve the end. But there is no justification for stopping a thoroly manly sport because it is sometimes abused, when the experience of every preparatory school shows that the abuse is in no shape necessarily attendant upon the game."

Athletics were good, he added, "especially in their rougher forms," because they tended to develop courage. We could not afford to turn out college men who would shrink from physical effort or from a little physical pain. But he would not be understood as excusing that perversion of athletic sport which would make it an end instead of merely a means in life. Study was even better than athletics. The President spoke of the need and value of productive scholarship, and then turned to a consideration of the duty of college graduates as citizens. "If your education and the pleasant lives you lead here," said he, "make you so fastidious and overrefined that you cannot do the hard work of practical politics, then you had better never have been educated at all. The weakling and the coward are out of place in a strong and free community":

"Like most other things of value, education is good only in so far as it is used aright, and if it is misused or if it causes the owner to be so puffed up with pride as to make him misestimate the relative values of things, it becomes a harm and not a benefit. There are few things less desirable than the arid cultivation, the learning and refinement which lead

merely to that intellectual conceit which makes a man in a democratic community like ours hold himself aloof from his fellows and pride himself upon the weakness which he mistakes for supercilious strength. Small is the use of those educated men who in after life meet no one but themselves, and gather in parlors to discuss wrong conditions which they do not understand, and to advocate remedies which have the prime defect of being unworkable. . . . The educated man who seeks to console himself for his own lack of the robust qualities necessary to bring success in American politics by moaning over the degeneracy of the times instead of trying to better them, by railing at the men who do the actual work of political life instead of trying himself to do the work, is a poor creature, and, so far as his feeble powers avail, is a damage and not a help to the country."

Much good, he said, had been done to the people of the Philippines during the last few years, "not by those who merely indulged in the personal luxury of advocating for the islands a doctrinaire liberty which would have meant their immediate and irretrievable ruin," but by men "who faced facts as they actually were, doing the hard and often disagreeable duty of the moment."

State Rights and Corporations

Mr. Roosevelt then directed attention to "the great questions which group themselves around the control of corporations in the interest of the public." There had been, he said, a curious revival of the doctrine of State rights in connection with these questions "by the people who know that the States cannot with justice to both sides practically control the corporations, and who therefore advocate such control because they do not venture to express their real wish, which is that there shall be no control at all." Honest and fair dealing railway corporations would gain and not lose by adequate Federal control. Those who invoked the doctrine of State rights to protect State corporations "in predatory activities" were as short-sighted as those who once invoked it to protect the slave-holding interest:

"The States have shown that they have not the ability to curb the power of syndicated wealth, and, therefore, in the interest of the people, it must be done by national action. Our present warfare is against special privilege. The men—many of them, I am sorry to say, college men—who are prompt to speak against every practical means which can be devised for achieving the object we have in view—the proper and adequate supervision by the Federal Government of the great corporations doing an interstate business—are, nevertheless, themselves powerless to so much as outline any plan of constructive statesmanship which shall give relief. I have watched for six years these men, both those in public and those in private life, and tho they are prompt to criticise every affirmative step taken, I have yet to see one of them lift a finger to remedy the wrongs that exist. So it is in every field of public activity. State rights should be preserved when they mean the people's rights, but not when they mean the people's wrongs; not, for instance, when they are invoked to prevent the abolition of child labor, or to break the force of the laws which prohibit the importation of contract labor into this country; in short, not when they stand for wrong or oppression of any kind, or for national weakness or impotence at home or abroad."

He enumerated the achievements of the nation in the last ten years, in legislation, in executive action, and otherwise. "In all these matters," said he, "there have been some men in public life and some in private life whose action has been at every point one of barren criticism or fruitless obstruction." All the credit for the good that had been accomplished belonged to those who had done affirmative work. In conclusion, he urged college men to be "doers rather than critics of the deeds that others do." They should take the lead in every fight for civic and social righteousness. This they could do only by taking their places among their fellow-men in a spirit of thorogoing democracy, in order that they might feel and sympathize with their hopes, their ambitions, their principles, and even their prejudices.

Philadelphia Reformers Defeated

At the election of city officers in Philadelphia, on the 19th, the reform ticket, supported by a fusion of the City Party and the Democrats, was defeated. Congressman John E. Reyburn, the nominee of the Republican party, commonly known in Philadelphia as "the organization," was elected mayor by a plurality of 33,000 over William Potter, candidate of the Fusionists. Colonel Potter is a Republican and was Minister to Italy some years ago. For a Prohibition ticket 405 votes were cast, and the Socialist candidate for

mayor received 1,680. While the reformers failed to elect a successor to Mayor Weaver, they made gains in the city Council, increasing the number of their representatives in the Select branch by two and in the lower chamber by fifteen. But in either branch they are still far from holding a majority. It is admitted by the defeated party that the election was fairly conducted. Representatives of the party say that a considerable number of Democrats voted for the Republican nominees. Among the explanations given by the newspapers in sympathy with the reform party are these: That Colonel Potter had only recently come over from the "machine" to the support of the reform movement, that he was nominated by objectionable political methods, and that sharp attacks upon the old ring and its supporters were discouraged in the campaign by those in authority. There was dissension in the reform ranks. Rudolph Blankenburg, a reform leader, publishes a long statement, in which he speaks of the effect of ambition, jealousy and clamor for office among the reformers. He also asserts that the office of Postmaster of Philadelphia was offered to Colonel Potter by a representative of Senator Penrose prior to his nomination for mayor and when he was chairman of Mayor Weaver's advisory board. This appears to be confirmed by Colonel Potter, who says: "Had I been willing, I should now be holding high office under the 'organization.'" Mr. Blankenburg also asserts that John C. Winston, chairman of the Committee of Seventy, held private conferences with James P. McNichol (Republican leader, partner of Boss Durham, and defendant in the filtration contract suits) concerning the organization of the Council.

Senator Smoot Retains His Seat

The long contest concerning the title of Senator Reed Smoot to his seat came to an end on the 20th, when the Senate, by a vote of 28 to 42, refused to pass the resolution providing for his exclusion. Nine Republicans voted against the Senator from Utah and three Democrats supported his claim. On the preceding day Mr. Smoot addressed the Senate in his own defense, saying that he was not a polygamist, that he never had been one, and had had only one wife. He had taken no oath, he added, which was inconsistent with his oath as a Senator. He owed to his church no allegiance which could interfere with his allegiance to his country. In the course of debate on the day when the final vote was taken, Mr. Dubois asserted that Mr. Smoot's cause had been supported by the President. "He wants him seated," continued the Senator from Idaho. "You have got the Mormon vote, my friends on the Republican side. But it has cost you the moral support of the Christian women and men of the United States." Among those speaking in behalf of Mr. Smoot was Mr. Foraker, who said:

> "No case whatever has been made that will justify us in either declaring the seat vacant or expelling the Senator from Utah. Reed Smoot has proved a better character than any other Senator here has a right to claim. He is so good a man that I almost doubt him. He has no vices. He does not drink, smoke, chew or swear, and he is not a polygamist."

The galleries were crowded with women, among whom were representatives of the organizations which have protested against the retention of Mr. Smoot in the Senate. It is understood that the President, in a letter to Senator Knox, commended the latter's recent speech in support of Mr. Smoot's title to his seat. For this reason the President has been sharply criticised by representatives of some of the organizations which have demanded the exclusion of the Mormon Senator.

Labor Questions

Owing to the opposition of the Democrats the passage of a bill resembling the Senate's (La Follette) bill concerning the hours of railway employees was prevented, on the 18th, on account of certain provisions which, it was asserted, would enable railroad companies to evade the requirements of the measure. Mr. Williams said the bill as it had been reported from the committee was a snare and a humbug. Five days later, the bill was brought forward with modifications which satisfied Mr. Williams and his associates, and it was passed without dissent. It forbids the employment of a workman for more than sixteen consecutive hours, and provides for the hours of

rest.——Cornelius P. Shea, president of the teamsters' union, and fourteen of his associates have been acquitted on their second trial, in Chicago, for conspiracy at the time of the great strike of the teamsters in that city. At their first trial the jury disagreed, seven members voting for acquittal.——A wage increase of from 10 to 15 per cent., ordered last week by the Frick Coke Company, affects 21,000 men and amounts to about $1,500,000 a year. Similar action by other coke companies will probably increase the number affected to 60,000. Among the wage increases made since January 1st are the following: Western Union and Postal Telegraph Companies, operators in the principal offices, 10 per cent.; about 60,000 textile workers in and near Philadelphia, from 10 to 15 per cent.; conductors, trainmen and yardmen of the Southern Railway, from 6 to 25 per cent.; about $400,000 a year to employees on the street railways of New York City.

Immigration from Japan

The Immigration bill, including the amendment relating to the exclusion of Japanese, became a law on the 20th inst. This amendment had been opposed by the Democrats in the House. On the following day it was announced that in an official message by cable to our Government, the Government of Japan had expressed its unqualified approval of the legislation in question and its entire satisfaction with the results of the recent conferences and negotiations. Replying to guarded criticism in the Tokio newspapers, the Japanese Foreign Minister has pointed out that the action taken by Congress is clearly within the provisions of the treaty of 1894. Critics should remember, he says, that this treaty was the price of the abolition of foreign consular jurisdiction in Japan. Immigration into Hawaii, where there is ample room, he adds, is not restricted. Secretary Root cabled the provisions of the new law to the Governor of Hawaii, for the information of Japanese there intending to sail for San Francisco. Japanese in the islands have sent protests to President Roosevelt and the Foreign Office at Tokio. The agreement reached at Washington concerning the treatment of Japanese school children in San Francisco provides that the public schools shall be opened to all children of alien races who are under the age of sixteen and can speak English, and that special schools shall be established for others who are unable to speak this language.

War in Central America

In defiance of the advice or warning given by the United States, Mexico, Costa Rica, Salvador and Guatemala, war is now in progress between Nicaragua and Honduras. The first battle was fought on the 18th, and other engagements have followed. Honduras asserts that the peace negotiations were terminated by an invasion of her territory by Nicaraguan troops. At last reports, the Nicaraguans had gained some advantage and were marching upon the capital of Honduras. It seems impossible to ascertain the cause of hostilities, but one explanation of the disturbance is that President Zelaya, of Nicaragua, desires to form a union of the Central American republics by force. Honduran revolutionists are serving with his army, and they were concerned in the recent quarrels about a strip of disputed territory on the frontier. The decision of the King of Spain as to this strip of land appears to have been rejected. It is expected that the five Powers whose advice was ignored will renew their attempts to make peace. Our Government may offer to intervene as an arbitrator.——In the first week of February General Antonio Paredes landed on the coast of Venezuela, his purpose being to promote a revolution against the Castro Government. On the 12th he and seventeen men who accompanied him were captured by Castro's troops and taken to Barrancas. There, on the 19th, all of them were lined up in front of a wall and shot. In the party were two Americans, John Godski, of Pennsylvania, and Thomas Lovelace, of Maine. Paredes was about forty years old. He opposed Castro in 1898, and was imprisoned for three years thereafter. His American wife, who was Miss Florence Hutchinson, of Chicago, had obtained a divorce from him.

Briand and the Pope Apparently no progress has been made during the week in the settlement of the French Church controversy. M. de Selves, Prefect of the Seine acting for the Government, has been conducting negotiations with Coadjutor Archbishop Amiette, representing Cardinal Richard and the Pope, over the details of the proposed leases of the churches to parish priests. Premier Clemenceau, altho having no confidence in the success of M. Briand's efforts at compromise, gave him his opportunity and M. Briand defended his policy before the Chamber of Deputies in a powerful speech. He declared that it was unworthy of Republicans, or free thinkers, not to respect the faith of millions of their fellow-countrymen. The object of separation was disestablishment, not persecution. Liberty of worship, whether Catholic, Protestant or Jewish, must be respected. The Catholic Church was not like any other sect. It had seen fit to forfeit churches, seminaries and rectories of which it might now be in possession, but this did not prevent the Government from recognizing the right of Catholics to worship, and the Government therefore intended to keep the Catholic churches open for Catholics and for no one else. The Minister said that the Church was sufficiently humiliated in being forced to solicit leases of the churches, and that to exaggerate the victory of the State would be to perpetuate religious quarrels. M. Briand's action was criticised by the extremists, who objected that he was practically renewing the Concordat by thus negotiating indirectly with the Pope. In spite of this the Chamber gave him a vote of confidence by ten to one. The ecclesiastical authorities still object to two clauses in the form of lease proposed by the Government. One is the clause which provides that the parish priest as lessee shall be responsible for keeping the church building in repair, and the other is that prohibiting members of the dissolved religious orders or any foreign priest from being parties to the contract. The Vatican considers it unfair to impose upon the parish priest the duty of making structural repairs and holds that it is an interference with freedom of worship that monks may not be parish priests. Since the seminaries of France have been suppressed it may be necessary, it is said, to eventually obtain foreign clergy. At present there is a deadlock between the national and ecclesiastical authorities and both parties refuse to reopen negotiations.

Papal Degrees Pius X has just raised to the rank of a University the Dominican College of St. Thomas at Rome, with the right to give university degrees; and this does not please the German scholars, who anticipate that the standard will not be equal to that of the German universities, and there is, says the *Fremdenblatt*, a movement on foot to compel all enjoying such degrees, if used in Germany, to annex the word *Rome* to the degree. Similar measures have already been taken against another Dominican university, that of Freibourg, in Switzerland. Outside of Rome there are but three Papal universities, Louvain (Papal and Royal), Freibourg and Washington. Two others, London and Dublin, which died in birth, are echoes of the days of Newman and Manning. It is curious, moreover, with all their power and influence and reputation for scholarship, that the Jesuits have not only no university, but not even a professor's chair in the three Papal seats of learning above mentioned.

Austro-Hungarian Politics The coming elections to the Reichsrath, the lower House of the Austrian Parliament, are of especial interest, because the Deputies are to be elected for the first time by popular vote. Up to ten years ago the Reichsrath was based entirely on the principle of class representation. There were four *curiæ* or electoral classes—the great land owners, the chambers of commerce, the towns and the country districts. In 1896, as a concession to the demand for popular suffrage, a fifth *curia* was added and a small proportion of the House was elected by direct vote of the whole people. The manner of voting, whether direct or thru electors, by secret ballot or open declaration, varied with the province, and the districting and representation were so contrived as to bal

ance the different races and classes. All this complicated and illogical system is now abolished. The Reichsrath voted for universal suffrage on December 1st. The Upper Chamber was reluctant to pass the bill, fearing the ultimate loss of its own power, but a few weeks later, under pressure from the Crown, it acceded to the reform, after safeguarding its own interests by securing the passage of a law restricting the number of life peers to 180 to prevent the swamping of the Chamber with new peers for the purpose of forcing thru legislation. The new electoral law confers the suffrage upon all men above the age of twenty-four who have been for one year in the same district. Since one-third of the population cannot read or write, there is no educational qualification imposed. Voting is by secret ballot, and a majority is required. In order to prevent race conflicts a certain number of representatives are assigned to each race, including the Jews, according to population and tax-paying capacity. For example, those who are registered as Czech voters can vote only for Czech candidates. The apportionment of Deputies among the several races has been fairly done in most cases, but the Ruthenes are deprived of their due representation in the interests of the Poles, whose votes were necessary to pass the bill. The party which is expected to make the greatest gains is the Clerical Anti-Semites or Christian Socialists, under Dr. Lueger. The Germans, who formerly dominated the House, will be reduced to an ineffective minority.——The Hungarian Cabinet, composed of a coalition of Magyar nationalist parties which got into power after a fierce struggle lasting several years, is now in trouble owing to the exposure of the corrupt practices of one of its members, Geza Polonyi, Minister of Justice. He was first charged by a Deputy of his own party, Zoltan Lengyel, with having abused his position as a member of the city council of Budapest in order to obtain, at the cost of the town, advantages for various industrial concerns in whose behalf he had appeared as counsel in the municipal court. Kossuth, as leader of the Independence party, championed the cause of Polonyi, and he was "whitewashed" by the executive committee of the party. But Lengyel reiterated the charge and added new and worse accusations, finally bringing the affair to a crisis by publishing in *facsimile* a letter written by Polonyi to Baroness Schönberger at Vienna, asking her to procure secret information as to the intentions of the Court. The Baroness is a lady of bad reputation who had led an adventurous life before securing a title by marriage, and it appears that Polonyi had agreed to pay her $10,000 to act as a spy on the Austrian Court for the benefit of his party then seeking power. This money Polonyi seems never to have paid. As soon as the affair was published the Baroness was expelled from the capital by the police "as a menace to public morals." Polonyi attempted to shield himself by the statement that Count Julius Andrassy, Count Albert Apponyi and other leaders of the coalition party had known and approved of his method of obtaining information, but all his colleagues, with the exception of Kossuth, turned against him, and he was forced to resign. Before resigning his position as Minister of Justice, however, he took advantage of it to institute libel proceedings against Lengyel. Dr. Günther, a follower of Apponyi, has been appointed Minister of Justice.——Ninety Ruthenian students in the university at Lemberg refused to take the oath in the Polish language, and, when refused admittance until this formality was complied with, sacked the grand hall, destroying furniture and punching holes in the portraits of the rectors. When imprisoned they joined in a "hunger strike." After three days the medical inspectors declined to be responsible for their lives and they were released.

The New Duma

The election of members for the next Duma has proceeded far enough to show that it will be even more radical than the last. Of the 518 members, the 410 who have been chosen are classified as follows:

Monarchists	75
Moderates	35
Progressives	23
Constitutional Democrats	74
Left party	152
Nationalists	40
Indefinites	11

The Constitutional Democrats will form a strong center party in favor of forcing

the Government to rule constitutionally by a responsible ministry, but they will not be able to control the radical Left, whose object is to use the Duma as a free platform of the revolutionary movement. It is expected that the Government will refuse to make any concessions to the Duma, and, upon the first manifestation of a disposition to overstep the narrow limits prescribed for it, it will be dismissed. The revival of anti-Jewish riots in Odessa and Warsaw has led to the suspicion that the Government would welcome an outbreak of disorder at the present time as an excuse for postponing indefinitely the assembling of the Duma. The Union of True Russians, a reactionary organization, has apparently had a free hand in Odessa for some weeks, and the plundering of Jewish shops and the beating and killing of Jews on the streets have become common occurrences, which the Governor, General Kaulbars, has made little effort to stop. The grain exchange and the universities have been closed, and the theaters and restaurants are deserted. The foreign consuls of the city have protested to their ambassadors against the prevailing lawlessness.

Boers Win in the Transvaal

The first elections under the new constitution granted to the Transvaal by the present Liberal British ministry has resulted in an overwhelming victory for the Boers. The Het Volk, the Boer party, will have thirty-seven votes in the Lower House of the Transvaal Legislature, which gives them a majority of five over all other parties combined. The Progressives, the opposing British party, will have only fourteen representatives. The other eighteen members are Nationists, Laborites and Independents, who have allied themselves with the Boers in the present campaign and will vote with them on most issues. Sir Richard Solomon was leader of the Nationalist party and made his campaign on the issue of the people against the capitalists, attacking the mining corporations as detrimental to the real interests of the people of the country. In opposition to this Sir Percy FitzPatrick claimed that the Progressives stood for the development of the resources of the Transvaal and that their defeat would ruin the financial prospects and industrial prosperity of the Rand. The new ministry of the Transvaal Colony will have as its Premier General Botha, one of the most successful of the Boer commanders in the war, and General Smuts and Advocate DeVilliers, who held offices in the South African Republic, will have the positions of Colonial Secretary and of Justice in the new Cabinet. The other Ministers are also members of the Het Volk. The Boers, however, will not have their own way in the Government, because the Upper House is for the present appointed by the Governor instead of being elected by the people. It contains a large majority of Englishmen moderate in politics. All bills relating to the natives must receive the approval of the British Secretary of State for the Colonies. The first and most important matter to be settled is the importation of Chinese laborers for the mines, to which the Boers and their allies are opposed. General Botha has made the following announcement of the future policy of his Government:

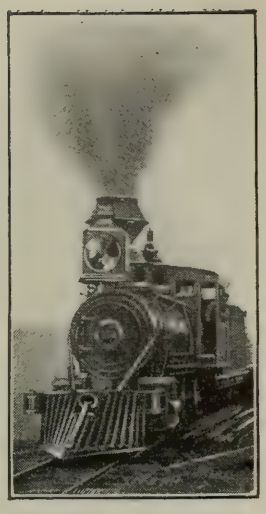
"British supremacy will be safer in the hands of the Boers than in those of cosmopolitan capitalists. We have fought and suffered grievously, more than anybody else in this country. That is past, and no one is so foolish as to want it over again. The questions of the flag and of supremacy have been settled for all time. They are both now outside politics. We are now concerned with our domestic affairs. Having got free government, our natural desire is, and our sole endeavor will be, so to govern that the country shall prosper and the two races be drawn together. At Vereeniging I signed the treaty of peace. I then solemnly accepted what is so dear to you —your King and your flag. They now are our King and our flag.

"People talk about our hostility to the mines. There is no such hostility. We simply object to the men who run the mines also controlling the running of the country. Had I wished ill to the mining industry as such, I, more than any man, had the fullest opportunity during the war of harming the industry by wrecking the works along the Witwatersrand reef. I recognized then, as I recognize now, that my people must look to the mines for help, and, as I protected the mines then, so shall I see that they are not injured now. This talk of wholesale Chinese repatriation regardless of consequences is nonsense. I say emphatically that nothing shall be done to embarrass the mines so far as unskilled labor is concerned. We want to restore confidence in the country. Could we do that by crippling or hampering the mines?

"We want to pursue a just and liberal policy

in regard to education. It is an accepted principle that English shall be the compulsory language."

Reaction in China



The reformers who are trying to bring China in line with modern civilization have received several very decided set-backs recently, and it is evident that the conservative forces are still too strong for them. When the new Board of Communications was established to have charge of steam navigation, railways, telegraphs and postal service, and placed in charge of progressive men educated in foreign countries, it was expected that in this department at least progress could be made, but now the Board of Communications is practically broken up. Of the three men who headed the board one had died, another is seriously ill and anxious to resign, and the third, Tang Shao-yi, a Cantonese and a graduate of Columbia University, has been censured by an Imperial edict for self-sufficiency and the employment of unsuitable subordinates. The "unsuitable subordinates" referred to were the first and second secretaries of the board, who were experts in railway matters. One of them was Shih Chao-Chi, a graduate of Cornell University, who, in consequence of the excellent examination which he passed in Western science, was received in audience by the Emperor. Tang Shao-yi has resigned his directorships of the Shanghai-Nanking and the Peking-Hankau railways to the Board of Communications. His plan for the construction of the Canton-Kau-Lung Railroad has been ratified by the Emperor. The road will be constructed by China with British capital and British engineers, and is to be completed in three years. Chinese students, who have returned to their native country after having studied in Japan, are being subjected to official persecutions by conservative authorities. Many of them have been arrested and some beheaded on the charge of disloyalty and suspected treason. Some Chinese officials are impeding the efforts of foreigners to relieve the famine.

Shipwrecks

There have been a succession of disasters at sea unusual in number and extent even for this season of the year. On the morning of February 21st the Rotterdam mail steamer "Berlin," running from Harwich to Hook of Holland, was wrecked at the entrance of the latter port. A violent gale had prevailed during the whole voyage from England to the Continent, which the steamer had successfully weathered, but just at the entrance of the narrow channel she was carried by the force of the wind and waves against the breakwater. The "Berlin" was a steel steamer of English build, twelve years old, and was in charge of one of the most experienced captains of the service. She carried 143 persons, all of whom perished except fifteen. The steamer struck on the rocks at the entrance of the river Maas and broke in two within a short time, the after part remaining upon the rocks. Only one man got ashore, and for thirty hours the Dutch lifeboats strove in vain to reach the wreck, but they were kept back by the high seas. Finally the boats succeeded in coming close enough to the wreck to rescue all persons who jumped into the water. Three women still remained upon the wreck. Prince Henry, Consort of Queen Wilhelmina, was active in leading the rescue party, taking an oar himself in the small boat, and caring for the comfort of the victims. It was forty-three hours before the three women still surviving upon the wreck were reached by a Dutchman, Captain Sperling, who swam thru the surf and, climbing the breakwater and vessel, lowered the women down by a rope into the boats. They were found huddled together for warmth among the drowned passengers, one of the women holding the dead body of her child in her arms. They had had only a few bits of food during the two days of suffering and exposure.——The Austrian Lloyd steamer "Imperatrix," bound from Trieste to Bombay, ran, on the evening of February 22d, on a rock near Cape Elaphonisi, on the Island of Crete. There were 150 persons on board and only a few of them are known to have been saved. The vessel sank very soon after striking.——The French cruiser, "Jean Bart," which went aground on a reef on the West Barbary Coast in a gale, was completely lost. The men were all landed without loss of life and some of the provisions and armament were saved from the wreck.

The Conditions of Train Acceleration

BY JAMES C. BAYLES, M. E., Ph.D.

[Owing to the frightful wreck on the New York Central Railroad last week and the railroad accidents all over the country, whose remarkable frequency seems to be at last exciting the whole American people, the following article by Dr. Bayles, a civil engineer and a railroad official of much experience, is most timely. —EDITOR.]

THE startling frequency and seriousness of train wrecks is one natural result of premature train acceleration. The constant public demand is for more rapid transportation. As one road tries to meet this demand other and competing roads feel that they must do so. Sometimes a reduction in the running time of trains is forced prematurely by a noticeable diversion of business. Sometimes it is decided upon to attract new business. Whenever announced it meets with public approval. On the other hand, train retardation, however necessary in the judgment of those responsible for the safety of train service, is regarded as showing parsimony and lack of business enterprise. In the balance sheet of a year's operation an occasional wreck appears less costly than traffic diversion would be; consequently, from the point of view of the board room of a railroad company, prudence and conservatism of life and limb do not seem attractive, if paid for in reduced gross earnings. This does not mean that any railroad management would deliberately incur the risk of wreck for mercenary reasons. It does mean, however, that in the effort to accelerate relatively slow trains, and still more those classed as fast, rules are adopted and enforced which are not conducive to safety, and great risks are taken with what is known to be an improper equipment. Briefly to consider this important subject from the point of view of the engineer may be of interest at a time when a great deal of hysterical newspaper discussion only serves to confuse counsel.

Everything being as it should be, it is perhaps as safe to run fast as slow. No attainable speed is "reckless" if every detail of plant and equipment is perfectly adapted to it. That is, the several classes of engineers and mechanics whose work enters into the appliances for transportation must co-operate to attain the admirable result sought by the deacon in building his one-hoss shay, and "make one part as strong as the rest." In theory this seems entirely possible. To a limited extent it is also possible in practice, as was shown in the preparations for the high-speed tests with electrical propulsion on the little experimental road at Zossen, Germany. In a large way it is at present impossible in practice. Much of the knowledge which is needed to make it possible has yet to be gained from experience and experiment, and after it has been gained and recorded it will be a long time—many years, at least —before it can find application all along the line.

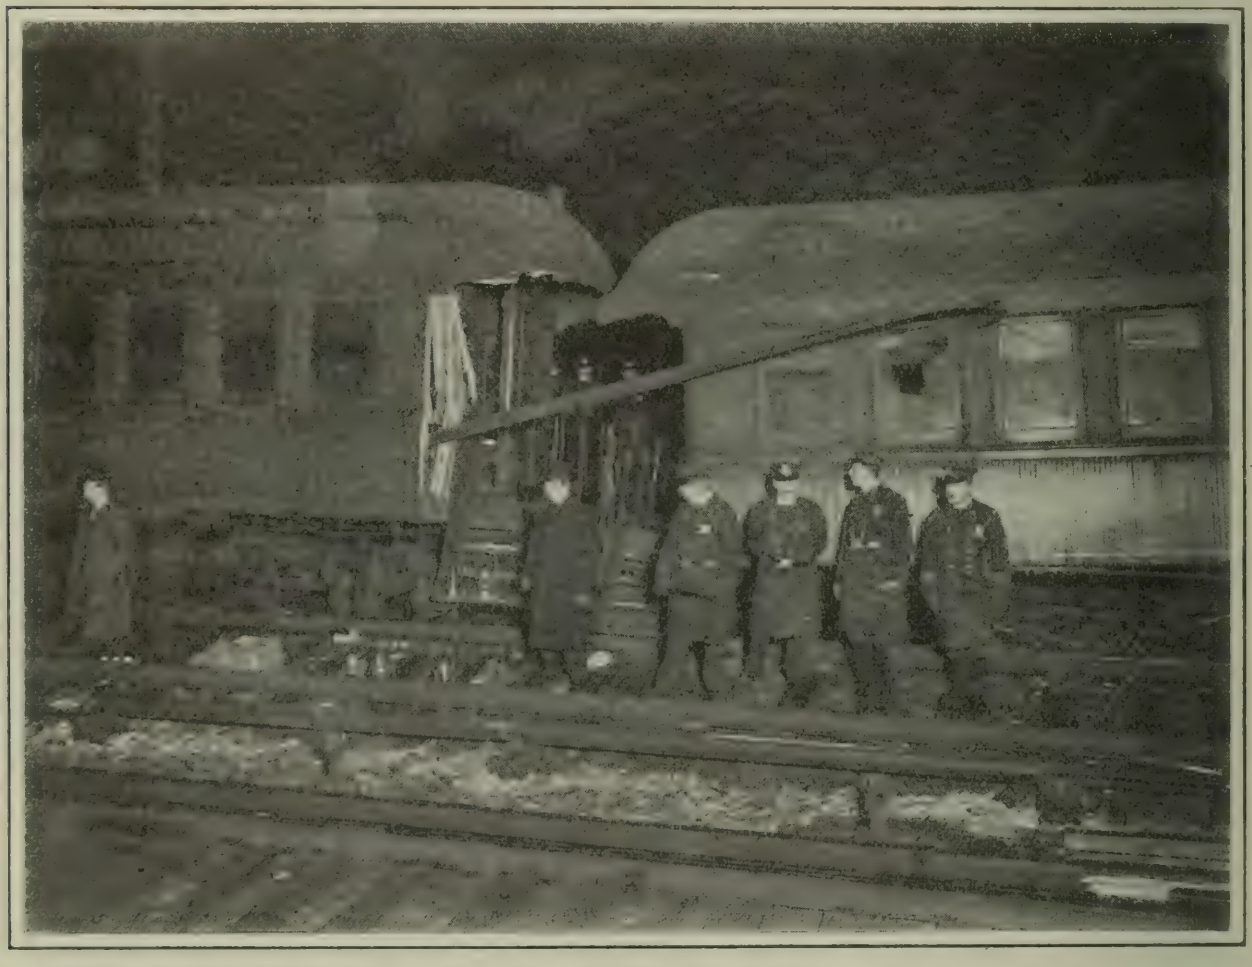
It is a safe generalization that in the present state of the art the average train speed is somewhat beyond the point which would be tolerated if only safety to life and limb were considered. This is shown by the fact that eighteen bad wrecks have been recorded since January 1st, all to fast trains. Admittedly, the safety line has advanced materially within the past ten years, and even within five years. In another ten years it may be found that running at sixty miles an hour is as safe under proper conditions as running thirty miles at the present time; but if this is true it is likely to be because a costly experience of wrecks and casualties has taught us that the par-

able of new wine in old bottles has an application much wider than has usually been given it. Old cars can be run on old roadbeds, laid with relatively light rails spiked to partly decayed ties, and over bridges much lighter in their parts and more infirm of construction than would now be approved, only about as fast as average experience up to this time has warranted. A very little acceleration would send millions of dollars' worth of property to the scrap pile and crowd the cemeteries with untimely tenants. It was one of the humors of the Zossen speed tests that no one was permitted to ride on the trains if married and with a dependent family, unless his life was insured to as near its full value as the Emperor deemed necessary. This was prudent, but not very much was said about it in the newspapers.

Experience has made it clear that every step in train acceleration must be prepared for by beginning at the bottom and working up. If any one item is overlooked or neglected, it locates a weak link in the chain which fixes the limit of its strength. The shocks and strains of train movement, tho unequally distributed, may be assumed to increase in geometrical ratio as speed is increased in arithmetical ratio. Of course this is not an accurate statement. As a matter of fact, the exact data needed to fix the ratio cannot be had, since it cannot be known just how strong anything is at a given moment until we break it, and having done so we can only guess how strong something much, but not exactly, like it may be. Nor can strains be measured in train movement. A thousand accidental causes may suddenly increase them above the limit of even liberal calculation. In this field of investigation pure mathematics will often lead to mistaken conclusions, largely because so many factors of every problem must be assumed. Knowing this much, it is evident that to prepare for material acceleration with such trains as are now acceptable to the traveling public, we must start at the very bottom and build

TYPE OF ELECTRIC MOTOR IN USE ON NEW YORK CENTRAL RAILROAD.
Picture shows the make-up of the wrecked train.

our roadbeds in the best possible way, practically regardless of cost per mile. Our rails must be of heavier section and better quality than the average Bessemer output, and we must find some way of more securely holding them in position. The highest available skill must be applied in every detail of bridge design and construction—and just here we encounter a difficulty in the ominous fact that the state of the art in iron metallurgy and rolling mill practice does not permit more than an approximation to uniformity in bridge material. Hence a very large factor of safety must be allowed for, since a bridge surely strong enough to carry any static load likely to be put upon it might very well not be strong enough to resist the shock of a 100-ton locomotive drawing a train of passenger coaches leaping upon it at the rate of sixty or more miles an hour. Of switches, signals and the like there is more to be said than space could be found for. They must be perfect in construction and inerrant in operation—qualities difficult, if not impossible, of attainment unless they can be made "fool-proof."



Assuming, however, that we have a permanent way of ideal and scarcely attainable excellence, we have but made a beginning in our preparations for safe speed acceleration. Heavy and powerful engines are required with driving wheels of large diameter. These may be had more easily than almost anything else needed. Cars must be built in which the greatest attainable strength shall coincide with the least possible dead weight. To build a practicable passenger car which will hold together at, say, sixty miles an hour, for as many hours as it must be run to earn its cost, is a problem which when studied is found to be complicated by conditions which must be traced back to the ore mine, the blast furnace, the steel works, the rolling mill, the foundry, the blacksmith's shop, and so on. Consequently,

Portions of the victims, shoes etc., are to be seen in the foreground.

even for the purpose of argument, we must assume ideal rolling stock.

This brings us to the problem of operation. The first conclusion to be reached would seem to be too obvious to need discussion. The fast train must have the right of way over every other train or it will be so delayed as to be taken quite out of that classification. Schedules are so arranged as to give this in theory; in practice it is not possible to insure it with a mixed traffic of express trains, way trains, freight trains, milk trains, newspaper trains, etc., complicated by drawbridges, grade crossings and the like. If everything worked out just as it was planned, the task of the train dispatcher would be a very simple one; but in railroading the unexpected continually happens. From causes unavoidable or avoidable, as may be, but apparently not to be anticipated or guarded against, every railroad has to be operated by telegraph. If one train is a minute behind its schedule it throws the whole system into more or less confusion. All sorts of accommodations and expedients have to be resorted to on imperfect knowledge of the facts, and no knowledge at all of the reasons. Sometimes telegrams are misunderstood, but not often. It much more frequently happens that the instructions wired from the division superintendent's office are not exactly those he would have given if better advised. In railway management good luck and good management have almost come to be regarded as synonyms. Nothing is better known to those who manipulate the telegraph keys in railroad offices than that during much of its daily run a very fast train is fairly comparable to a 12-inch projectile fired across New York without aim. Such a shot may pass between sky-scrapers, avoid steeples, go harmlessly over roofs and come to ultimate rest in a sand bank in the suburbs; but even the adventurous speculators of London Lloyds would not

THE THIRD RAIL AS IT PENETRATED TWO CARS AND CAUSED IGNITION OF WOODWORK.
Photographed at 4 a. m., after cars had been raised

insure that result of its flight for a less premium than one hundred guineas per cent. Nothing is, or, in present conditions of mixed traffic operation, can be, quite ready for the "flyer," and when it passes safely every track walker, station master, switchman and crossing guard gives a sigh of relief and thinks about something else.

To provide for such train acceleration as the public has learned to expect and demand, one of the first and most essential requirements is a corps of railroad servants so vigilant, so intelligent and so conscientious that every man of it will do exactly the right thing at the right time. If such a staff could be recruited it could be held together and its efficiency maintained only by large wages and short hours. This suggestion need not be elaborated. It would carry the discussion wholly outside the domain of political economy, within which questions of labor and wages are supposed to belong.

If this summary of the chief factors in the equation of high railway speeds is correct, it warrants certain very definite conclusions. That it is correct from the point of view of the engineer is shown by the following extract from a conservative and intelligent news report of observations connected with the recent disaster to the White Plains Express of the New York Central service:

> Statements made yesterday by Assistant District Attorney Smyth, after his investigation, seemed to indicate the possibility that the electric motor going at high speed at the curve was too much for the strength of the rails and shoved one of them out of place. Coroner Schwannecke said that he thought the rail which was knocked out of place had not been properly set. The railroad officials, in a statement issued in the afternoon, said that they had not learned the exact cause of the derailment. They added that there was evidence that a break in one of the wheels of the motor car occurred at the point of derailment, as pieces of the broken wheel were found there. In almost the same place a rail broke, but it was impossible, they said, to determine which of these two things caused the derailment.

In this instance there was no misplaced switch, no obstruction, nothing noticeably wrong. The speed was simply higher than roadbed or rolling stock were equal to, and it is a fair presumption that every part of the new electrical installation and equipment were as good as could be provided. The facts in this and a hundred other like cases would seem to show that it is much easier to accelerate train movement beyond the point of safety than to get ready to do it safely. But that does not advance us much, unless it be to make it clear that high speed is not simply a question of going fast and faster. It has economic and sociological aspects as well. For example:

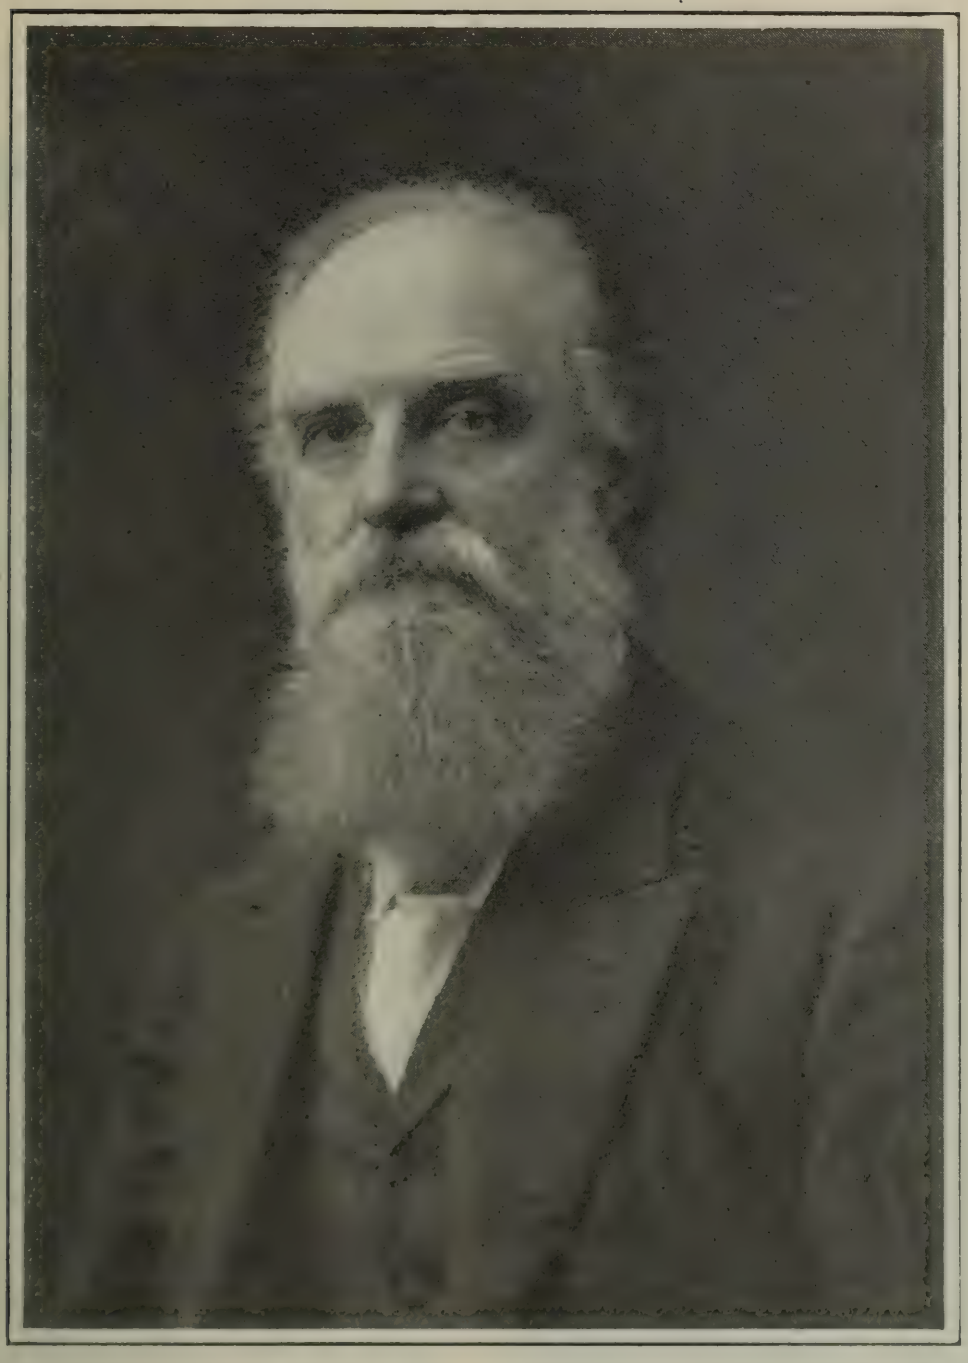
The public demands greater speed in train movement than can now be made with even average safety.

Enterprising railroad managers are anxious to meet this demand for business reasons.

Both traveler and railroad manager are willing to "take chances," altho both know it puts life and limb in greater jeopardy.

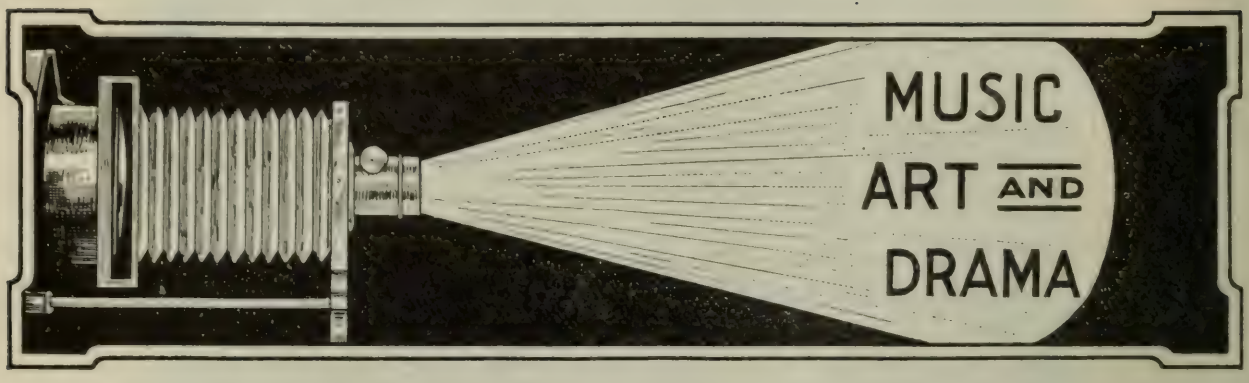
So long as danger is avoided, by however narrow margins, fast trains are patronized to the limit of their capacity and often "booked" long ahead, and few take the slower trains unless they must. When a fast train is smashed, with the usual consequences, the incident is soon forgotten. The world makes news very fast. Passengers still want to go as quickly as they can be carried and railroad managers want fares.

Meanwhile, it is only just to assume that the conscientious railway manager is impelled by considerations of self-interest, if by no higher motive, to bring his roadbed, permanent way and equipment up to the standards fixed by continually advancing requirements, but he never quite accomplishes this. Strengthen his chain as he may, there remain many weak links, some of which he knows to be weak and others of which he knows nothing. Years of time and millions of dollars of expense would be required to prepare for what he wants to do today and hopes to improve upon tomorrow. Having what is little better than the proverbial choice between the Devil and the deep sea, he must do the best he can with the facilities at his command and "chance it."



Speculation as to whether the conditions of modern life demand such economy of time as would excuse unsafe speed, and whether, whatever its advantages, it is worth what it costs, is no part of the duty of the engineer, as such.

New York City



Alexis Aladyin

ALEXIS ALADYIN is best known as the leader of the Peasant Party in the last Russian Duma. His parents were poor to the point of misery. But the boy attended the local schools, and determined to go to college. He studied medicine at the University of Kazan, which was near the annual famine belt, and Aladyin saw much and failed to keep his opinions to himself. Even then he began to speak too loud. When he went up for his examination he was informed that it would be useless. The faculty had determined that he might not continue his studies. Undaunted, Aladyin turned to the faculty of science. He managed to stick to it for three and one-half years. Then came the final expulsion. He went at once to the outskirts of Kazan, there to labor among workingmen. He organized trade unions. He dwelt upon the value and necessity of education. At last he was arrested, and received a sentence of four years in prison, solitary confinement, followed by eight years of exile in the frozen North, in the Government of Archangel. He succeeded in escaping across the frontier into Germany. Later he went to Brussels and then to Paris. Then he crossed to England. At Toynbee Hall, the great social settlement, in the heart of Whitechapel, he gave lectures. When the famous manifesto of last October was issued, Aladyin was the first to return to Russia. He came to St. Petersburg via Finland, and during the December strike was one of the leaders. When the Duma electors began to be talked of, his villagers asked him to accept their nomination. He at once formed an electoral committee, but upon receiving secret information to the effect that he might be "taken" at any time he again went away. When again he returned to the capital he found himself elected to the Duma as a Deputy.

Nicholas Tchaykovsky

NICHOLAS TCHAYKOVSKY is one of the few remaining figures of the Revolutionary Movement in Russia in the early 70's—1870-75, as described by George Kennan in his remarkable book. He is sometimes called the "Father of the Russian Revolution," because he was the founder and the soul of the mother organization of so-called "Tchaykovtzi," from which sprang later on quite a series of successive revolutionary organizations, terminating in the famous duel between the terrorists and Emperor Alexander II. He was one of those young men and women who gave up their lives of comfort and pleasure in the early 70's to live and work among Russia's disinherited toiling millions. He suffered imprisonment on several occasions for his work as social reformer and political agitator, and at last was forced into temporary exile abroad. This brought him in 1875 to the United States, where he lived the life of a farmer for two years in a colony near Cedar Vale, Kan. Then he migrated to Philadelphia—mostly on foot—in order to work as a laborer and a ship carpenter at a shipyard at Chester. About a year later he returned to Europe to resume active participation in the revolutionary movement of his native land. As it was impossible to return at once to Russia, he settled in London, which has been his headquarters since 1880. He is now sixty years old, and has a grown family. For several years he has represented his party—the Social Revolutionary Party—in England and elsewhere, and has visited Russia from time to time "on business." In Russia, among all progressive people, the name "Tchaykovsky" stands for absolute moral integrity. This was the reason for his being delegated to the United States to arouse public protests against the barbarous inhumanities committed by the Czar's clique against the Russian people and to promote sympathy for the cause of Russian liberty.

Grand Opera

When Mr. Conried became manager of the Metropolitan Opera House he tried to introduce a useful reform, so far as New York is concerned, by giving Philadelphia a separate season of two or three weeks, instead of one weekly performance thruout the whole metropolitan season—an arrangement which the singers and players detest. The Philadelphians, naturally enough, demurred, and the change was not made. It is said that Boston has expressed a desire to have Hammerstein and his company once a week *à la* Philadelphia, in place of a week's operatic gorge; but inasmuch as Boston is three times as many hours from New York as Philadelphia, it is not likely that this plan will be carried out.

MARIO SAMMARCO,
As Rigoletto, at the Manhattan Opera House.

The Metropolitan Company's visiting list this year includes Boston, where eight performances will be given in Easter week. The tour opens in Baltimore on March 25th. Other cities to be visited are Washington, Chicago, Cincinnati, St. Louis, Kansas City, Omaha, St. Paul, Minneapolis, Milwaukee, Pittsburg. The repertory will include "Salome," four of Wagner's operas, "Aïda," "Madama Butterfly," "Tosca," "La Bohême," "Faust," "L'Africaine," "I Pagliacci" and "Haensel and Gretel." Of the prominent singers four will not go on tour—Sembrich, Cavalieri, Burrian and Rousselière. The fact that the Baltimore season begins on March 25th does not mean that the Metropolitan will be closed on that date. Mr. Conried has a big company, and while some of his singers are busy in Baltimore, the German contingent will do a second Nibelung cycle in New York. "Parsifal," also, will probably have another hearing at the Metropolitan.

The lovers of Wagner's operas have had some cause for discontent—not so much qualitatively speaking as quantitatively. In the days of Jean de Reszké, Wagner ruled the roost. He preferred the Wagner operas to the others, and that settled it, for whenever he sang the

house was full, and Mr. Grau, tho not a Wagner enthusiast, was obliged to let the petted tenor have his own way. Now we have Mr. Caruso as dictator. He sings two French rôles tolerably well; the rest is Italian. Had Mr. Knote been here, there would have been a counterweight, but Burrian's voice has not fascinated New Yorkers, while Burgstaller has but a limited repertory.

Nor were there any prima donnas to come to the rescue. Both Madame Ternina and Madame Morena were prevented by throat troubles from crossing the ocean, and Madame Nordica had meanwhile accepted an engagement at New Orleans. Luckily Mr. Conried succeeded in persuading Madame Gadski to join his forces, and thus it was made possible at last to produce "Tristan and Isolde" to a crowded house; for this most Wagnerian of all Wagner operas is more popular here than even "Lohengrin" and "Tannhäuser." Madame Gadski had never sung the rôle of Isolde before, but she had worked hard at it for two years, and she sang it beautifully and with passion, altho some of the sarcastic, angry passages of the first act were not brought out with sufficient force. The love music of the second act was sung exquisitely by her and Mr. Burrian, who at last demonstrated that he can also sing softly.

The Puccini cycle culminated in the first Italian presentation of "Madama Butterfly," which was a gala event. The composer superintended the rehearsals, but did not conduct. The orchestra left something to be desired in the matter of nuance, but otherwise the performance was superb. With such singers as Caruso, Scotti, Reiss, Mühlmann and Homer in the rôles, respectively, of Pinkerton, Sharpless, Goro, the Bonze and Suzuki, great possibilities were provided and realized; but the center of interest was Geraldine Farrar in the rôle of Chio-Chio-San, the deserted Japanese wife, waiting for her faithless American husband.

By way of offset to the Puccini cycle, Mr. Hammerstein has been presenting to the patrons of the Manhattan Opera House a series of Meyerbeer nights, including a revival of "Dinorah," with its silly story, but theatrically effective music—an opera affording Madame Pinkert rare opportunity for displaying her really remarkable facility in florid song. But the great attraction at the Manhattan has been Madame Melba. Every time she sings the house is crowded to the doors, and the sale of tickets for the standing room has to be stopped. Mr. Hammerstein persuaded her to give up her concert tour, and he has, of course, re-engaged her for next year. There are rumors of engagements offered to some other eminent Metropolitan artists; even Mr. Caruso has threatened to consider proposals unless his nightly emolument is made $3,000, or double what he now gets.

MELBA
At Manhattan Opera House.

Mr. Hammerstein has some more interesting operas up his sleeve, including "Lohengrin," which everybody is anxious to hear as interpreted by Mr. Campanini, and the "Hélène" of Saint-Saëns, in which Madame Melba, who created the title rôle at Monte Carlo, will appear. His season is now an assured success, and there is no doubt that he will have another next winter. It is a wonderful achievement for one man. Mr.

Hammerstein is not only a good business man but also an excellent judge of voices, the latest proof of this being the engagement (to replace Renaud) of Mr. Sammarco, a baritone with an exceptionally beautiful voice, who has created a sensation.

Some New Light Operas

It would be insulting, as a matter of course, to head this section of our mensal review "Some New Operettas," for it is well known that the purveyors of "comic operas" and "musical comedies" get red in the face when their works are called operettas. Why the diminutive should be resented in this case it is not easy to see. Baker's "Dictionary of Musical Terms" defines an operetta as "a little opera, with reference either to duration or style of composition. The text is in a comic, mock-pathetic, parodistic, or anything but serious vein; the music light and lively, in many cases interrupted by dialog." There is surely nothing insulting about this, but it is significant that when Mr. Upton wrote his book on the plots and the music of the stage works of De Koven, Sousa, Luders and their European colleagues he prudently chose the title "Standard Light Operas." We follow his example to keep out of trouble.

There was a time when Reginald De Koven was as much in vogue here as Puccini is just at present. When the managers insisted on degrading operettas more and more to the level of vaudeville, he honorably abstained from yielding to their wishes. In the autumn, with the aid of Mr. Henry W. Savage's forces, he attempted to bring back light opera of the "Rob Roy" kind. His librettist, however, handicapped him, nor is the music of "The Student King" as freshly melodious as that of his earlier operettas (*sit venia verbo*).

More satisfactory in every way is the successor of this work at the Garden Theater, "The Little Michus," the composer of which is no less a personage than M. Messager, one of the directors of the Paris Opéra, the composer of the grand opera "Le Chevalier d'Harmental," the comic opera "La Basoche," and the charming operetta "Veronique," one of the daintiest and most delightful productions that have ever come from France. Perhaps "The Litle Michus" falls a trifle short of it in merit, at least in the first act; but as a whole it is, with the exception of "Veronique," the most entertaining light opera that has come across the Atlantic in years, and no one who loves good music and likes to laugh should fail to see it. The plot is based on the mixing up of two girl babies in a bath-tub, with the result that no one knows which one is the daughter of the famous French general and which the daughter of the provision merchant and his wife, who have taken charge of her. Mr. Graves, of London, who enacted the part of the General, took his place at once among our leading fun-makers, and Mr. George Fortescue also made a hit.

DR. A. S. VOGT,
Conductor of the Mendelssohn Choir of Toronto.

One of the favorite American fun makers, Mr. De Angelis, on the other hand, came perilously near failure with his latest production at the Manhattan Theater, entitled "The Girl and the Governor." It was not his fault, by any means; he was irresistibly funny, as usual, in the droll septet-serenade and

wherever else the librettist gave him a chance; but these chances were too few, and the music, by Julian Edwards, did not make amends, altho there were several tuneful numbers which the audience eagerly redemanded. Mr. Miron, in the guise of a South American medicine man, made a sensation with his incantation. Mr. De Angelis impersonates the Governor of a Spanish port, who tries to win the affection of a shipwrecked English girl, who plays the shrew to escape his attentions, as her heart belongs to an English officer.

"The Rose of Alhambra" is another recent production that calls for mention, at least for the sake of its music, which is by Mr. Hosmer, and much of which is obviously charming, altho the company which sang it in New York is, with some exceptions, inferior to that which did it elsewhere. The exceptions were Misses

EMIL PAUR,
Conductor of the Pittsburg Orchestra.

Agnes Cain Brown and Greta Risley. The plot is slim and dim, and the dialog not overfunny.

"The White Hen" is a pleasing musical comedy by Roderic C. Penfield and Gustave Kirker, and affords Louis Mann another opportunity to shine as a star, and to bring his familiar and often amusing dialect to the fore. The music is bright and sparkling, being the best that M. Kerker has written in a long time. The chorus shows the admirable effects of good training. The real, live donkey which figured in "The White Hen" scored heavily by means of intelligently wagging his ears at every opportunity.

A Musical Triumph for Canada

Enthusiasm almost without precedent filled Carnegie Hall on the evenings of February 12th and 13th, when the Mendelssohn Choir of Toronto and the Pittsburg Orchestra gave two joint concerts. The orchestra and its conductor, Mr. Paur, while they acquitted themselves with credit, especially in the ninth symphony of Beethoven, were not the main objects of this enthusiasm; New York has better things in that line; but what astonished and delighted everybody was the way the Canadian choir sang Liszt's "Thirteenth Psalm," Gounod's cantata "By Babylon's Wave," the final choruses from Wagner's "Meistersinger," and other things. It was electrifying.

Who has not at some time or other dreamed of a body of singers selected and trained as carefully as the members of a permanent orchestra, producing effects altogether beyond the reach of the usual chorus of amateurs? England has such "vocal orchestras," as one might call them, and so have a few German cities; but New York has none, wherefore the song of the Canadians came as a revelation. The conductor, to whom most of the credit is due—Mr. A. S. Vogt—is a Canadian who was educated in Germany. Apart from his personal gifts, he has a method which explains his success. He limits the choir's membership to 220, and the constitution of the society requires that the chorus disband after each season's work, and that a complete reorganization be made annually. In this way superannuated singers are easily eliminated. The choir has been in existence eleven years. It is to be hoped that its visits to the metropolis will become annual; such concerts are as refreshing as spring breezes.

Recent Concerts

The fact that the musical season is already approaching its last quarter is rather startlingly brought to mind by the announcements that the last of the eight sets of subscription concerts to be given by the New York Symphony Orchestra under the direction of Mr. Walter Damrosch is to take place on March 9th and 10th, and that the last but one of the eight sets of Philharmonic concerts occurs on the first two days of March. One of the two rival opera houses also closes its portals next month; so that the field will be left mostly to the solo skirmishers and the givers of charity concerts, who are usually put off by the managers to the last moment, for the obvious reason that charity begins at home.

After a tour of the West Mr. Damrosch returned to New York and gave a concert which contained an interesting novelty by an American composer—"The Festival of Pan," by Professor Converse of Harvard. It is a composition suggested by a reading of Keats's "Endymion," and hovers between absolute and program music in the romantic fashion associated particularly with Robert Schumann. It is a well written piece, and indicates that the musical department of Harvard seems likely to hold its own on the creative side also, altho John K. Paine is no longer among the living. Mr. Damrosch's last program contains a composition which has been most unjustly neglected since Theodore Thomas left New York—the Scherzo Capriccioso of Dvorák, one of the most melodious and exquisitely orchestrated works of the "Bohemian Schubert."

American music has been considerably in evidence this month. At the last concert of the People's Symphony Orchestra, Mr. Arens conducted two excellent productions of our soil, the "Melpomene" overture of Mr. George Chadwick and a "Southern Fantasy" by W. H. Humiston. Mr. Chadwick's overture, like Converse's piece just referred to, is concerned with the spirit of its subject—the Muse of Tragedy—without being real program music. Tho obviously influenced by Wagner and Liszt, it is one of the most original orchestral works ever written in this country.

While Mr. Chadwick, who is the director of the New England Conservatory in Boston, has long been favorably known as one of the few American composers whose works have crossed the Atlantic, Mr. Humiston is a new comer. He is a native of Ohio, a pupil, on the organ, of Clarence Eddy, and in composition of Edward MacDowell. The audience was so much pleased with his "Southern Fantasy" that it called him out four times. What was more significant still was the obvious enjoyment the musicians derived from the work while they were playing it; significant, because it showed that Mr. Humiston knows how to write "gratefully" for the orchestral instruments, and has a musical story worth telling. His "Fantasy" is based in part on two themes borrowed from the plantation song as exemplified by Stephen Foster; but these borrowings are of slight importance compared with the melodic and harmonic contributions from the composer's own creative faculty.

At the Philharmonic concerts Mr. Safonoff continues to abash those who took it for granted that he would be great in Russian music only. He has shown himself, on the contrary, remarkably international in his taste and capacity. If he failed to arouse the same frenzied enthusiasm with the third symphony of Brahms as with the "Pathetic" of Tchaikovsky, there is perhaps good cause to suspect that the reason therefor lies not entirely in the conductor. Brahms may be an intellectual giant, but he is dry; and what arouses enthusiasm is emotionalism, as embodied in Tchaikovsky *par excellence.*

An interesting novelty at the fifth Philharmonic was the lyric suite of Edvard Grieg, which made so agreeable an impression that one of the numbers was redemanded. The suite consists of four of Grieg's pianoforte pieces, opus 56, which Anton Seidl arranged for orchestra. Grieg was greatly interested in the discovery that these pieces ("The Shepherd Lad," "Gangar," "Nocturne" and "March of the Dwarfs") were suitable for such a setting; but Seidl's orchestration was somewhat too Wagnerian, in

his opinion, to suit the style of his music, so he rescored them in part, and now they make a most welcome addition to the scant list of the great Norwegian's orchestral works. Having had, for nearly forty years, only one lung to breathe with, he has not felt sufficiently energetic to undertake a lengthy symphonic work. However, the world is none the less pleased with his short musical poems, and what he has written for orchestra is distinguished by rare beauty of coloring.

At the sixth Philharmonic Schubert's ninth symphony was on the program, and of that also Mr. Safonoff gave a reading instinct with romantic charm.

Soloists of note have been few and far between of late; they are waiting for the operas to move on. Notice must be made, however, of a recital by Mrs. Fannie Bloomfield-Zeisler, who used to be called the Sarah Bernhardt of the piano. She is somewhat less fiery now, partly owing to the effects of a serious illness, from which she has just recovered; but she is still a most entertaining pianist, full of temperament, and able to tell a musical story in a style of her own. Her enchanted audience made her repeat several of her numbers. At the end she played the well-known Schulz-Evler arabesque on Strauss's valse melodies (not the "Salome" Strauss, but the Waltz King) about half as fast as Rosenthal plays this medley. It was an odd whim, yet the result was delightful—it brought out the dainty, graceful, poetic features which raise the waltzes of Johann Strauss so high above the level of ordinary dance music.

A unique place among musical entertainments is held by the Concerts of Old Music given by Mr. Sam Franko every winter. This year there has been only one, Mr. Franko having been kept busy as leader of the violins at the Manhattan Opera House. The program included works by Fasch, Holzbauer, Pergolese, Grétry and Haydn, all of the eighteenth century. In these days of monster orchestras and monstrous music we need something of this kind to hold the balance; that is, we need to hear the simpler works of the old masters played by a small band in a small hall, in order to convince ourselves that there are in music other things worth looking at beside skyscrapers. There are many who derive more pleasure from a Haydn symphony or an operatic selection from a Grétry opera than from the symphonic poems of R. Strauss and those Mahler symphonies which take up the time of a whole concert. Mr. Franko's concerts are being duplicated in the cities of Germany, where they are even more cordially welcomed than here.

In connection with this movement it is of interest to hear that that valiant champion of antique instruments, Mr. Dolmetsch, is busy in Boston trying to graft onto the modern piano some of the good qualities of the medieval clavichord and harpsichord.

Architectural League

The Architectural League, the Woman's Art Club and the Salmagundi Club have all had their annual exhibitions during February.

That of the Architectural League was, as always, the interesting conglomeration of studies and completed works in the allied arts, which makes this exhibition the most widely instructive to layman and art students of any held during the year. There were an unusual number of careful studies and restorations of ancient monuments of the deepest interest, including those of the Panthéon at Rome by Chedanne of Paris, of the Cathedral of Florence by Duquesne, both of whom had also studies of other Italian monuments. Marcel of Paris showed restorations of the Hotel Bourgthéroulde at Rouen, and there were many drawings of Greek monuments by W. F. Price; of Italian churches by W. L. Bottomley, and studies of mosaics in Sicily and Italy by W. L. Harris. These, with some modern English cottages by Dunn and Watson of London, and the many competitive drawings for the Peace Palace at The Hague gave the exhibition an international character.

Of buildings more immediately interesting to New Yorkers, the McKim, Meade & White design for the Pennsylvania Railroad terminal on Manhattan, Freelander's model and drawings of the Importers and Traders' Bank, Howell's and Stokes's Chapel of St. Paul at Co-

OBVERSE AND REVERSE OF ADOLPH WEINMAN'S MEDAL FOR LIVE SAVING ON RAILROADS.
As Shown at the Architectural League Exhibition.

lumbia, and Allen & Collen's design for Union Theological Seminary—another of the monumental structures rapidly covering Columbia Heights — all show the continued building activity of the time. Such designs as that of Donn Barber & E. T. Hapgood for the Connecticut State Library and Supreme Court Building; Cram, Goodhue & Ferguson's Cathedral for Halifax; and the many decorations for buildings thruout the country, of which photographs are shown, give us a chance to judge of the fact that this building activity is not confined to one locality. North, South, East and West, the Americans are reaching out for beauty.

Of the decorations shown, that by Blashfield for the Baltimore Court House, in which is "Washington Laying His Commission as Commander of the Army at the Feet of Columbia," is sane and quite beautiful, tho one rather wishes that this painter would not give us so many of these vast canvases, and would go deeper in each. Howard Pyle's "Landing of Carteret" for the Newark Court House is a big, highly colored illustration. Kenyon Cox's lunettes for the Iowa State Capitol do not err in this direction, but in that of triteness. Turner's decorations for St. Andrew's Church on the West Side suggest mosaics. Elliott Dangerfield's "Magnificat" for St. Mary the Virgin's looks interesting in the photograph. Of a different character from any of these is the gay ceiling decoration by Schaettle, with its whirling, airy figures. There are many small panels of much charm—three by Albert Herter for an artist's studio, called merely "Painting," "Sculpture" and "Architecture," are exceedingly clever and original. A design for a window in a tomb in Brooklyn, by Hugo Ballin, is very charming in composition. Most of the other windows are of a good average.

Monuments of a more purely sculptural character were few here. Parts of the McKinley Monument, by McNeil, were shown. Good realistic work without much inspiration. A photograph of the Quadriga on the Minnesota State Capitol, by French and Potter, looks impressive. The best bit of sculpture in the exhibition was a medal by Weinman for "Life Saving on Railroads," to be given by the Government. He showed also the panels for the front of the Morgan Library in Thirty-sixth street.

McKim, Mead & White's design for the Prison Ship Martyrs' Monument in Brooklyn is in the best of taste and truly monumental. A feature of the exhibition was a group of fourteen drawings illustrating the work of Stanford White.

The President's prize of a bronze medal for a decoration went to J. M. Lichtenauer, and the Avery prize of $50 to Lilian Link for a door-knocker in bronze.

Textiles, pottery, book-covers, etc., were as numerous as ever.

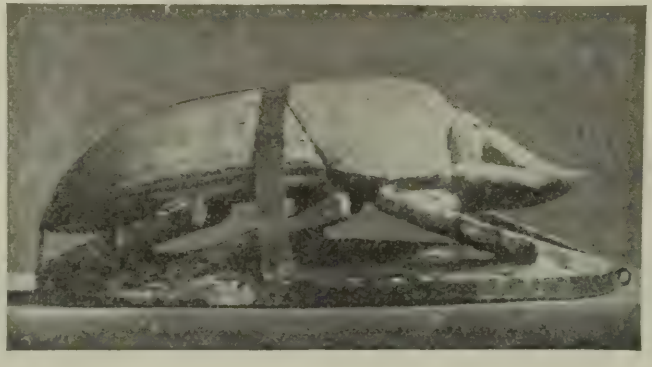
Outside of New York, the month brought two exhibitions of paintings, at which were seen more good things together than our winter Academy exhibition produced. Of greatest interest was

the first important exhibition held by the Corcoran Art Gallery at Washington on somewhat the same lines as that annually held at Philadelphia and now open there. A fine group of Sargents included the splendid canvas of the "Four Doctors," painted for Johns Hopkins and shown at the last Royal Academy. Nine pictures were bought for the permanent collection of the Corcoran Gallery. They are Shannon's "Girl in Brown," Shurtleff's "The First Snow," Redfield's "Delaware River," Homer's "Light on the Sea," Horatio Walker's "Ave Maria," Wilton Lockwood's "Peonies," Mary Cassatt's "Woman and Child," Childe Hassam's "Northeast Headlands," Groll's "Land of Hopi Indians." The gallery may also buy Metcalf's picture "May Night," which took the gold medal and the Clark prize of $1,000, and Dougherty's "Land and Sea," which we reproduced last month.

The other prize winners at Washington were Frank Benson, who won the silver medal and $500 for his "Against the Sky"; Redfield, who won the bronze medal and $250 for a landscape at Philadelphia; the Temple gold medal went to Metcalf also for his "Golden Screen." Sergeant Kendall's "Beatrice" was bought by the Temple Fund Committee, Ernest Lawson's "River in Winter" was judged the best landscape, Marion Powers won the $300 Lippincott prize and Mary Smyth Perkins the Mary Smith prize of $100.

Mr. Macbeth's two exhibitions since the last art notes have been of the works of Paul Dougherty and Charles H. Davis, while Mr. Montross has given us three men in his two exhibitions—Edmund Tarbell alone, and T. W. Dewing and D. W. Tryon together. Both dealers report excellent sales. Seven of the Dougherty's were sold, and this, with the admiration given to his "Land and Sea," must make this painter feel himself well

WASHINGTON LAYING HIS COMMISSION AS GENERAL AT THE FEET OF COLUMBIA.
For the Baltimore Court House, by Edwin Howland Blashfield, shown in the Architectural League Exhibition. From photograph by Shaefer & Son, Baltimore, Md.



established in public favor. He well deserves his success, and among the twenty canvases in his exhibition several were as good as the "Land and Sea"—which is saying a good deal.

Davis is always tenderly lovely and an annual sight of his work is a treat.

Tarbell's fresh air and glowing light appeared in twenty-five canvases. Each year now he gives us a new interior that is a masterpiece of technique. "The Girls Reading" was sold at this year's exhibition for $3,000.

Both Dewing and Tryon are masters now and in their very different ways give us pleasure in color and design that cannot be had except among their things. Dewing is the more original, but Tryon goes very deep in his landscapes.

Of foreign pictures and "Old Masters" we have had a chance to see many excellent examples in the early English exhibition at Ehrich's, and at the Fischoff sale, where French, Dutch and English works of an excellent character are to be sold February 22d and 23d at the Waldorf.

A SCARAB OF SETI I.

All over the country the art teachers of the schools and the directors of museums are conferring, with a hope of making the museums more directly useful to the public. A very active agent in the stimulation of the movement is that very able little weekly, the *Art Bulletin*, published by the American Art Annual at 20 West Thirty-fourth street. It should be read by all interested in the increase of the influence of art in America.

The Boston Museum of Fine Arts, thru a bequest of Mrs. Martin Brimmer, has recently received and placed on exhibition in the First Egyptian Room a scarab of very unusual size and workmanship, some account of which appears in the Museum's current bulletin. The newly installed scarab belongs to the reign of Seti I (circ. 1326-1300 B. C.) in the nineteenth dynasty. It is of a greenish-blue faïence and measures 11.3 cms. by 7.8 cms. A very unusual feature, apart from mere size, is the curious so-called "harness" for suspension which appears in the accompanying illustration. This "harness" is of electrum, or "pale gold," and is carried around the scarab's base, while a second strip, passing transversely across the back, is met by a third band that runs lengthwise along the line of the wing covers. This scarab differs essentially from the more conventional forms, in which base and body form one solid piece, in that the beetle is raised on its legs above the base, as if in the act of walking, which alone makes it very remarkable. The face of the scarab was once gilded, and some traces of the gold leaf still adhere. The usual inscription is lacking, but in its place is a series of eighteen cartouches bearing the name and prename of Seti alternately repeated. Seti I was the father of Rameses II and was one of the greatest monarchs of antiquity. Many monuments to him are found from Palestine to Nubia. The Seti scarab now in the Boston Museum is perhaps the most remarkable specimen of this class of objects in the world.

The February Exhibition at the Grolier Club was concerned with engraved portraits of actors of olden times. The catalog contained 190 numbers. Many old-time celebrities were represented in line, stipple, mezzotint, aquatint and otherwise. Many of the engravings included in this showing were executed by F. Bartolozzi, some by C. Turner, and many by other contemporaneous artists after famous paintings by Sir Joshua Reynolds and other masters. Nell Gwynne is represented by several portraits in various rôles. Garrick, Siddons, Mrs. Cibber, Colley Cibber, Fanny Kemble, Ann Oldfield, Margaret Woffington and other old-time actors and actresses were reproduced in portraiture, if not in

wit, at this very interesting club showing.

The exhibition of engravings by early German masters, held at Keppel's February 9th to March 9th, was notable for the strength of the Dürer collection, which was included. A print of St. Eustace of the second period, from the collection of Pierre Mariette, signed on the back and dated 1667, deserves especial mention. The impression was singularly sharp in every detail, and was printed on High Crown paper with very wide margins. This print was a splendid example. The other Dürers included "St. Christopher," "The Holy Family with the Locust," "The Prodigal Son," "Adam and Eve," "The Night," "Death and the Devil," "The Last Supper," and "Christ Appearing to St. Gregory." One example of Lucas Cranach was a unit in the exhibition. Several examples of the work of Lucas of Leyden were included, as well as several prints executed by Heinrich Aldegrever.

The prize cover competition held by the *Woman's Home Companion,* in which cash prizes aggregating $3,500 were offered for five cover designs, is concluded. The jury, consisting of Sir Casper Purdon Clarke, director of the Metropolitan Museum of Art; Robert J. Collier, of *Collier's Weekly;* Will H. Low, Alexander W. Drake, of the *Century Magazine,* and I. H. Chapin, of *Scribner's Magazine,* awarded the prizes as follows: First prize, $1,500, E. Stetson Crawford; second prize, $1,000, Louise Cox; third prize, $500, H. C. Wall; fourth prize, $250, Blanche Greer, and fifth prize, $250, Herman Pfeifer. Nearly 5,000 designs were submitted during the competition, a number coming from England, France, Japan, Canada and the West Indies. The winner of the first prize, Earl Stetson Crawford, lives in New York, but was born (1877) in Philadelphia. He studied under Whistler, Bouguereau, Ferrier and Puvis de Chavannes, in Paris, and was a pupil of the Pennsylvania Academy of Fine Arts. His specialty in art work is mural decoration. *The Woman's Home Companion's* cover design is notable, inasmuch as it affords the first instance where a single prize of $1,500 has been offered for magazine cover designs.

Drama

The Marlowe and Sothern plays and the appearance of Miss Ellen Terry are the most important events of the month in New York dramatics.

In our last review of the drama we discussed "John the Baptist." Since then Mr. Sothern and Miss Marlowe have brought out "Jeanne D'Arc," "The Sunken Bell" and some of Shakespeare's plays. "Jeanne D'Arc," of course, centers around the most romantic woman in history, and naturally the Maid of Orleans is the principal character. Even Mr. Sothern as the Duke D'Alencon takes an almost insignificant rôle. The play is rather a series of pictures from the life of Jeanne D'Arc than a connected, logical drama. Percy Mackaye, the playwright, is ambitious enough to emulate the blank verse and diction of the time of Shakespeare, and the product is not nearly as bad as might have been expected. But Mr. Mackaye has made an outrageous concession to the supposed demands of the modern audience when he permits Jeanne D'Arc, who is in prison and about to go to the stake, to undergo a love scene with the King's brother. The play is wonderfully acted, marvelously staged, and Miss Marlowe as the Maid of Orleans appears to her best advantage, especially in the girlish phases of Jeanne's career. The play has received unstinted praise from the critics, and yet, if it were not produced by the best theatrical company in the United States, we doubt if it would cause the slightest furore.

Certainly those critics who prophesy that the poetic drama is about to have its innings once more can adduce many points in favor of their view, among which would be the fact that "The Sunken Bell" is received with much more favor now than when it was first presented in America many years ago. This is a decidedly encouraging indication of the advance in public taste, for "Die Versunkene Glocke" is one of the most abstract as well as beautiful of modern German dramas. Hauptmann's symbolism is undeniably involved and difficult, especially to us who have not as children been fed on Teutonic fairy lore, but it is not necessary for one to have worked out a recondite theory of its meaning in order

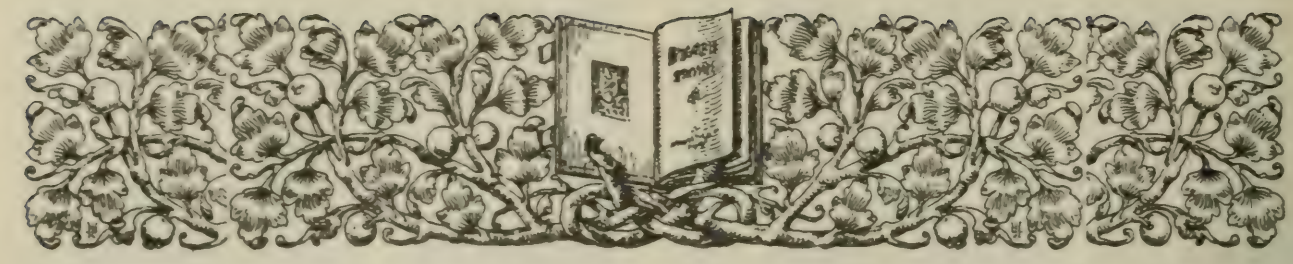
to enjoy the play and to be impressed by it. Fortunately the players had a version that is a real English poem, the translation by Charles Henry Meltzer, and the lines were on the whole well delivered. Especial praise must be given to Mr. Buckstone's elocution in the Nickelmann's description of the ringing of the bell under the water. Its intonations will always be in our ears as we read it. It is a great pity that he could not have also given the similar passage in the last act, probably the finest in the whole poem. Mr. Eric made the satyr a very real and natural personage, and Madame Le Moyne gave an interesting interpretation of Old Wittikin. Miss Kruger was not nearly so successful in the part of Magda as in that of Herodias. It is unnecessary to say that the fullest use was made of the opportunity for beautiful stage pictures.

It is like meeting an old friend, long absent, to see Miss Ellen Terry on our stage again. Thousands of people who know nothing about her except that they have seen her act regard her with the tenderness felt for an old friend rather than the admiration felt for a great artist. Surely no actress in our time has such a hold upon the popular heart. She has been playing in New York for several weeks, and, although it cannot be denied that she has grown a bit older than when she was here before, there is no change in the faultless art, the matchless voice, the gracious sense of sunniness and light, the eloquence of every movement of her arms and exquisite hands, which long ago made her inimitable. It is a pity that on her present visit she should not have appeared in better plays. She began with one of Bernard Shaw's paradoxes and finished with two other plays, "The Good Hope" and "Nance Oldfield." The first of these is one of the best and truest studies of coarse Dutch fishing folk life we know of. But the theme is hard and repulsive. A mercenary ship owner sends the ship, "The Good Hope," to sea, which every one in the place knows to be rotten and unseaworthy. Most of the lads living in the place ship on her and all are lost. Miss Terry is the widowed mother of two of the crew, whom she urged and forced to go because of her poverty. Her part has no charm of any kind, and indeed it has no distinction. Miss Terry might as well have appeared in any other part in the play. "Nance Oldfield," on the other hand, is a play in which Miss Terry's best art is shown, and in which she long since achieved a notable success; but it is, after all, only a farce, and a rather insignificant farce at that. She should give us, before leaving the country, some of her really great parts, such as Viola, Portia, and, best of all, Queen Henrietta in "Charles I." No English actress living has surpassed her acting in that play.

"Captain Brassbound's Conversion" was written by Bernard Shaw expressly for Miss Terry, and the part of Lady Cecily certainly fits her. Since it was written the play has been doubled in significance by being enacted in actuality by Raisuli and his troupe of real Moroccan bandits. Unfortunately for Perdicaris, he had no Lady Cecily Waynflete along with him, but our Yankee blue-jackets responded to their cue and came to the rescue like the book. In Miss Terry's company the best actor is Mr. Elton, who takes the part of the London hooligan to perfection. Mr. Carew, who is highly praised by the general public, seems to us to carry reserve and self-control to the point of stiffness and monotony.

It is a pleasure and a surprise to find a lively farcical comedy like "All-of-a-Sudden Peggy," which depends for its hits on real humor and not on horseplay, innuendo and epigram. Miss Henrietta Crosman makes the most delightful of Irish girls and we do not wonder that all of her associates forgive her when her "suddenness" in decision puts them into embarrassing positions. The whole company play evenly and well.

"Genesee of the Hills" is an adaption of Marah Ellis Ryan's story "Told in the Hills." It is a conventional melodrama wherein everything happens like clockwork and all turns out well in the end, as we knew it would. Even the two villains have a chance to redeem themselves by showing their good qualities. The play is rescued from mediocrity only by admirable staging and good all-round acting. Miss Galloway is a typical garrison girl we have met at several frontier posts.



Sydney Rosenfeld's "The Aero Club," as produced at the Criterion Theater with Lulu Glaser in the leading rôle, is

a pleasing and amusing comedy. A complication that is incidental arises because the balloon in which the operator and the girl are the only passengers remains 3,000 feet above the earth over night. This paves the way for a mustard foot bath and other elements of realism that constitute unusual stage business. In "The Aero Club" Miss Glaser was audacious and clever.

A play now being given in New York in an unpretentious way, *Liebelei,* or "The Reckoning," is of unusual interest, because it represents a dramatic type quite new to us in this country. The author, Arthur Schnitzler, has made himself conspicuous even among the younger Viennese writers for his bold disregard of the conventionalities of literature both as to matter and manner. He breaks away equally from the method of Scribe and that of Ibsen, from the climacteric plot and from symbolic introspection. Almost all the tricks that we call theatric are eliminated.
Miss Katherine Grey is the star, tho that term cannot be appropriately used in this type of play.

JAMES CAREW AS CAPTAIN BRASSBOUND, ELLEN TERRY AS LADY CECILY WAYNFLETE IN "CAPTAIN BRASSBOUND'S CONVERSION," AT THE EMPIRE THEATER

A Nut for Psychologists

BY THOMAS DE QUINCY, JR.

HAVING had rugged health over a lifetime of more than fifty years, I was suddenly stricken with an illness which, in a few days, became grave, and then as suddenly turned to recovery. During the critical period—having no notion that it was critical—I was so little incommoded that, finding myself wakeful at night, I asked of my physician permission to read. This was reluctantly granted, provided I made my literary fare accord with the extremely innocuous diet to which I had been restricted. Hence the selection of a novel of Mr. Anthony Trollope—I mention this to show that no mental excitation sufficient to account for what follows was occasioned by reading.

I should also add that while I am generally familiar with the theosophical conception of the astral body and with stories like Du Maurier's "Peter Ibbetson" based thereon, I have made no study of psychical phenomena. And probably because my professional work has always demanded exact reasoning and rests on physical science, I have had little interest in metaphysics, or in whatever things there may be in heaven and earth undreamt of in the Baconian philosophy of works. These, from my viewpoint, have always seemed "beyond the reaches of our souls"; and, anyhow, nothing had occurred immediately prior to my illness to attract my attention to them.

Three weeks having elapsed since the crisis, I find myself fully equal to my regular mental work. While the impressions hereafter noted—or whatever else they may be called—doubtless were nothing more than a sick man's delusive visions—the Horatian *"aegri somnia vana"*—nevertheless, they have remained during this interval clear and unaltered, so that it seems reasonable to assume that they are now independent of my physical state.

At about the middle of one night—things then threatening their worst—I closed Mr. Trollope and decided that being ill, altho it had for me all the spice of novelty, was nevertheless a bore; that the confinement of it and the fever heat were disagreeable, and that I had been shut up long enough. Then ensued the following colloquy between two Me's.

First Me—"Well, if you don't like it, why do you stay here?"

Second Me (Seeing nothing unreasonable in the suggestion)—"How can I help it?"

First Me—"You needn't; just go."

Second Me—"Go? Where?"

First Me—"Anywhere."

Second Me—"Nonsense!"

First Me—"You don't understand. *You* go; *I* stay here."

Myself (Very wide awake)—"What silly stuff this is. Temperature must be getting up." (Trollope resumed.)

A few minutes later I remembered that on a very hot summer's day I came north from Paris in a stuffy car and found delightful coolness on the beach at Scheveningen, Holland. Then:

First Me—"Why don't you go *there?*"

Second Me—"To Scheveningen?"

First Me—"Certainly. You can do it. It won't hurt you. Try!"

Thereupon I found myself on the roadway of the Scheveningen terrace about ten feet from the curb of the outer sidewalk and not far from the Kurhaus I walked to a settee facing the shore. There was a fresh breeze off the North

Sea and the low surf came in bristling with sharp little whitecaps. There was nothing hazy or dreamlike in my surroundings. Everything, even to details, was perfectly clear. The endless Bath chairs, like toadstools on the beach—the stone cubes in the revetment of the terrace—the noise of a cart rattling over the pavement—distant music—the ubiquitous peddlers of postal cards—the tracery of the ironwork of the pier and the flags fluttering—I felt the cool salt air in the very depths of my lungs; as the sense of revival grew, the first thought that formed itself was:

"Well, you did it, didn't you?"

And then, with this conviction of accomplishment, I reverted to the sick room across the Atlantic and enjoyed the contrast. No impression is more definite than that I remembered at that time the circumstances of my coming there and wondered over them.

I arose to walk, and found my underpinning weak—as I expected. I recalled the doctor's prohibition of exertion, and decided to stroll slowly past the long line of shop windows and amuse myself by looking into them. I had been so long confined that I wanted mind employment and to move about, now that I was refreshed. I came to the restaurant in front of and under the Kurhaus. I entered it merely to sit down and then pass thru it to the shops on the other side, for I was getting a little tired. I asked of a passing waiter the position of the nearest door leading to the arcade. He paid no attention. I tried another. He seemingly neither saw nor heard me. I walked across the room, put out my hand to open what seemed to be the sash of a glass door, and my hand went thru it. I then passed thru the closed door and stopped on the other side and thought about it. I distinctly recall gazing somewhat vacantly into a window full of millinery while thus engrossed. I got as far as concluding that to move thru solid matter in any such way as that I must be an ether vibration; but did not pursue the reflection because I again recollected the physician's warning; and besides, it occurred to me that whatever brain power I had must be divided between the two Me's, and as I had only a part of it immediately available, I could not reasonably expect it to make safe, logical deductions.

I resumed my stroll—occasionally crossing the roadway to rest on the seats on the terrace edge, and gaze out on the water, and northerly to the long perspective of the dunes. Near the end of the side walk I found a book shop. The door was open. The stock obviously of old books was arranged partly on shelves, which lined one side of the room, and partly on a long table where the backs of the books were uppermost. A middle aged man—I have since tried to recall his face, but in vain, altho it was then clear—evidently the proprietor, sat near the table reading. He returned my "Bon jour"—and spoke in French of the delightful weather. As I turned to the books on the shelves he said: "Better look along the table. There is more there to interest you."

I began at the end of the row and read the titles. They were all strange to me, and I recollect but one—"The Poetical Works of Jane Ryan." There were eight octavo volumes, bound in dark blue leather with small conventional gilt ornaments on the backs. I took up the first volume and opened it at a biography of the poet from which I read that she had attained great celebrity and that her fame had been steadily growing for the last half-century. To the proprietor I said:

"This is queer. I thought I was fairly familiar with English literature but never before have I heard of Jane Ryan or seen anything of her works."

"Naturally," he replied, "they never were written. That is true of all the books on the table. They contain nothing but thoughts which might have been given to the world by their authors, but which never were."

I glanced at the books on the shelves but of these the titles, mainly French, were old acquaintances. I don't know why I noted particularly a Dutch translation of Macaulay's essays. At all events I attempted to take down a volume of it and my hand went thru it. I could not even grasp it. In the effort to do so I found that I could carry my hand as freely thru the rows of books, as thru the closed door in the restaurant. Like Macbeth's dagger, they were evidently not sensible to feeling as to sight. But yet

the books on the table were not thus. Those I could move and handle. I suppose I must have looked astonished, for the man laughed.

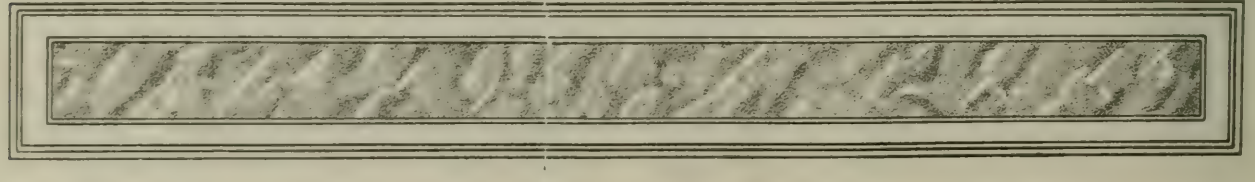
"Of course, you cannot move the shelf books," he said. "You have no control whatever over the transference of matter. You could not displace even a grain of dust."

Just then I remembered that to the waiters whom I had addressed in the restaurant I had seemingly been inaudible and invisible.

"How is it," I demanded, "that you can converse with me?"

"Why not," he said, "I am as you are. I am ill and bed-ridden in one of the hospitals of The Hague. I left a person in charge here. You see he is absent. I expected neglect and it preyed on me—for all my livelihood is this shop—so I came."

The differentiation of his motive for being there and mine established itself definitely enough and started a train of thought—but the partial brain refused to follow—and again I feared over-exertion.



I bade him farewell. Outside, I tried to recall having seen that shop before. Altho I recognized readily three or four other stores I could not do so—nor so far as I know is there any old book shop in Scheveningen. The sense of bodily fatigue was now increasing. I passed thru one of the side streets to the tram station and began to debate whether I had better return to The Hague by the old Scheveningen road under the trees or by the new route along the Canal. This was the only time that I lost sight of the preceding circumstances, since I evidently supposed that I was residing at The Hague and had come thence to the seashore. The next instant I corrected this. I recall the sense of relief as I remembered that there was no reason for going anywhere but home.

"Barchester Towers" was still in my hand, closed with my finger marking the place. The bedside light was bright and there was no sensation of waking up. I was simply there. The incidents which had just happened were perfectly vivid. I thought them over in the present surroundings without any notion of incongruity, any more than I would have had had I actually walked into an adjourning room, taken part in some event and returned. There was no break in the continuity of the physical fatigue. In this respect I felt exactly the same as I did in the tram station in Scheveningen.

But the bored feeling had gone. I was cool and sleepy. And when I awoke in the morning my recovery had begun.

"Never tell thy dream," sagely remarks Epictetus, "for tho thou thyself mayest take a pleasure in telling thy dream, another will take no pleasure in hearing it." To that wisdom I subscribe. But the point here is not the dream which was quite rational as dreams go, but the fact that at no time during the whole of it was the closest scrutiny and criticism of every happening relaxed. From the moment I apparently arrived at Scheveningen to the instant of leaving it I believed that I was observing phenomena and trying to understand them. In every instance I carried this thought-search to the limit of such brain power as I had, at the same time recognizing that this was below normal, and fearing to overtax it. As I have already indicated, the knowledge of the circumstances in which I came to Scheveningen steadily persisted, with the single lapse at the end, and that instantly corrected. And the progressing sense of physical fatigue seemingly bridged the physical conditions. Finally the evidence of the medical chart of bodily temperatures indicating the turning point exactly coincides with the period of the dream.

Such is the story of what seems to be a somewhat singular "false creation" proceeding from the heat-oppressed brain.

American Law in China

BY LEBBEUS R. WILFLEY

[A few months ago Judge Wilfley was appointed Judge of the United States Court for China, largely, it is thought, because of his fearless work as Prosecuting Attorney in the Philippines in disbarring unscrupulous lawyers who would take retaining fees and then abandon their cases, and in suppressing newspapers printing libelous publications against the United States Government. Some of these disturbers of the peace, particularly the former class, have fled to China, and Judge Wilfley has had to execute his reforms over again by making strict rules as to the character of the attorneys permitted to practice in his court. Since the following article was written he has held examinations and disbarred seven of the nine American attorneys practicing in Shanghai, with the consequence that a storm of protest has arisen. It is understood, however, that that was just what Judge Wilfley was sent to China for and that President Roosevelt heartily approves of his course. Mr. Wilfley is a native of Audrain County, Missouri, and is a graduate of Central College, Fayette, Mo., and of the Yale Law School. He was made Prosecuting Attorney in the Philippines in the spring of 1901, and in 1904 was appointed by President Roosevelt to be a delegate to the Universal Congress of Lawyers and Jurists at the Louisiana Purchase Exposition. This article was obtained as an interview.—EDITOR.]

THE creation of the United States Court for China by Congress at its last session is a unique experiment in the history of our judiciary. It grows out of the commercial necessities of the situation, and is based upon the principle of extra-territoriality which is now in force in China by virtue of our treaty relations with that country. Our trade with China in recent years has grown enormously, to such extent, in fact, that our consuls-general, who were formerly clothed with judiciary functions, are now no longer able to attend to both their judicial duties and the regular business of the consulates. Therefore, in connection with Secretary Root's reform of the consular service thruout the world, in China this court has been established. It is designed to be a tribunal of the same dignity and character as our own regular United States courts. The court will have jurisdiction to try all cases, civil and criminal, formerly tried by the consuls-general, except small cases, of which the consuls-general still have original jurisdiction.

Our treaty with China provides that in all cases where an American is the defendant he may take his case before the American consul-general, or, as is now ordered, into this new court.

I find that many Americans do not understand the broad application of the principle of extra-territoriality which gives the United States authority to establish a court of its own in the Empire of China. This may be briefly explained. It is a doctrine of international law that a nation has jurisdiction over the person and property of foreigners who sojourn within its territory, and is responsible for the acts done in its boundaries in which foreign nations or their citizens are affected. This right, which international law recognizes as belonging to the sovereign states, China has partially surrendered in the treaties which she has made with Western nations. According to these treaties, the person and property of foreigners in China are exempt from her jurisdiction, and are no longer subject to the operation of Chinese law. An American, for instance, is under the protection of his own flag, and his property is specially guarded by the laws of his own country. Our laws themselves, no less than the administration of them, are fundamentally different from the Chinese. This surrendering up by China of her sovereignty and ceding it to Western nations is expressed within the term extra-territoriality.

The laws enforced by the United States court which I am to establish will be the revised statutes of the United States, and in cases where these statutes are inadequate, the principles of the common law of admiralty and equity will apply. An appeal lies from this court to the United States Court of Appeals for

the Ninth Judicial Circuit, and from that court to the Supreme Court of the United States.

The court consists of a judge, a district attorney, a clerk and a marshal, all of whom have been appointed by the President, and are now in China, with the exception of myself. The judge is appointed for a period of ten years, at a salary of $8,000 a year. The district attorney (Mr. Arthur Bassett, of Paris, Mo., who has been for four years in the Philippines as assistant attorney in the Bureau of Justice) receives a salary of $4,000 a year. The salaries of the circuit clerk and of the marshal are each $3,000.

JUDGE L. R. WILFLEY,
Of the United States Court for China.

I shall organize the court immediately upon my arrival in China. Shanghai, of course, with its large foreign concessions, the commercial center of China and the great distributing point of that country, will be the headquarters of the court, but provision is made also for the holding of regular terms at Canton, Hankau and Tientsin, and special terms shall be held in other treaty ports whenever necessary. The official title of the court is "The United States Court for China" and the judge is "Judge of the United States Court for China."

Great Britain has for about half a century had its own court in China. This is presided over by a chief justice, and is arranged on a scale somewhat less elaborate than the United States court will be. There is also the "mixed court," presided over by a Chinese official, to which cases are taken that have a foreigner as plaintiff and a Chinaman as defendant. Two days in the week are given to cases with American defendants, three days to those with English defendants, and the remaining day to other foreigners. In the mixed court the foreigner's protection lies in the presence of an "adviser" from the consular force of his own nation, who sits with the Chinese judge and has the right to protest against any decree which seems to him unjust.

But with faith in the future one can see a great commercial outlook for China. The nation is in a state of upheaval. No one can predict just what may result, and there may be most radical changes. Should a constitution be granted and a revised code of laws be introduced, with an incorruptible judiciary, a currency reform and a greater advance in scientific teaching in the schools, China could take her place among the most progressive nations. There is no doubt that the yeast of the Occident has been firmly implanted in the country. Who can tell in how many directions it may eventually work? It is not entirely imaginative for the man of middle age today to expect to live until extra-territoriality in the sense in which the term is now employed shall have become a thing no longer necessary in China.

ST. LOUIS, MO.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Senator Knox

EVER since he rather suddenly emerged from his Pittsburg law offices to be United States Attorney-General, at the call of President McKinley, Philander C. Knox has been among the watched ones. It's a case of "Pleasure's all mine," for Senator Knox as little needs watching as almost anyone in public life—in spite of all the charges of corporation and railroad complications to the contrary. Senator Knox has not spent much time denying them for the simple reason that he never denies anything; but he did say, the other day, that he never had anything to do with the great steel combine and was never attorney for the Pennsylvania Railroad. Of course that atmosphere of childlike innocence which always envelops him is not strictly indicative, and it is dangerous to be deceived thereby; nevertheless I firmly believe that when Senator Knox puts himself to the inconvenience of denying anything he does it with the conviction that he is simply saving the other fellow from making a fool of himself. We watch him simply because it is refreshing and entertaining. Physically as well as politically it is refreshing. When he is as old as Senator Hale he may be as crabbed and austere. There are indications pointing that way—more than there were about "Bub Hale," over at the House end, not so many years ago. But Hale is seventy-one. Knox is only fifty-

ATTORNEY GENERAL PHILANDER KNOX.

six by the calendar and less by ordinary observation. As yet he retains the spice of life—variety. You know precisely what Hale will do, how he will do it, what he will say, how he will say it. You're not so sure of Knox.

Knox is a small man—exceptionally small; small as Hale; almost as portly; and between them there is not more than the possibilities of fifteen years' development, in inherent, unapproachable pomposity. There is this to be said of Knox, that it is not artificial. It is altogether unconscious. He has solid shoulders and a full chest. He stands and walks like a naval officer on parade—merry ones about the Senate say that he has to, to keep in balance the massive head he carries on his shoulders.

That head is a study. It attracts attention instantly and holds it almost to a breach of courtesy. It has been called a Napoleon head. Perhaps. It is broad and deep, with a high crown and big, bulging forehead from which the black hair is beating a successful retreat. The face under the forehead is good to look at, but suggestive of other things than the massive dome. It is a smooth-shaven, delightfully clean and open face, narrow and long, delicately put together, exceptionally fair and free from wrinkles. There is so much room inside the thinking chamber that apparently there has been no occasion for thoughts to furrow canals outside.

Knox is one of those phenomenal readers with a capacity so far beyond the comprehension of common folk that no tale is too vast to be believed. As he never denies anything there is no use asking him if it is true, but he is credited with reading every daily paper of importance published in Pennsylvania, every periodical published anywhere, every new novel of any value, the Washington newspapers and the *Congressional Record*, besides everything new in law matters and all that is necessary to accomplish his quick, complete and comprehensive grasp of the various topics of debate which he handles with such equanimity. There's doubtless more truth in it than in some stories. There's absolutely no fiction in the fact that he is one of the brainiest men in the Senate.

No one doubted Knox's ability. He had given too good evidence of it in the Department of Justice, under two Presidents. But when he slipped from the Attorney-Generalship into Quay's Senatorial shoes, that air of innocent egotism about him caused some of the standard Senators to smile. They did not realize how purely natural it was to him—as natural as it is for him to be the best dressed man in Washington. They thought he was banking on having been Attorney-General. They whispered about what would happen. The Senate is a mighty leveller. For a time Knox felt the pressure, but what he was was so innocently unintentional that he couldn't take the hint. He didn't take it. He has been just the same every day, ever since. Nor did it take him long to assume a position among the most influential whose hands are on the helm of our Ship of State. Later, when he was offered a seat at the Supreme Bench and instantly declined it, no one wondered. His ambition was for power, and the Senate was the place for him.

What he has already accomplished, in the world as well as the Senate, was evident in the way the country sat up at attention the other day when Senator Knox came out in favor of Reed Smoot's retaining his seat, in one of the strongest and most effective speeches he has ever delivered. Anathemas came rattling all over him immediately from the earnest women everywhere, who had gone daft in their determination to strike obsolescent polygamy thru unpolygamous Smoot, making the Senate turn him out whether it had the right to or not. The venerable chaplain of the Senate, Rev. Edward Everett Hale, put the truth in a nutshell when he said of Knox's speech:

"I listened with great interest and thanked him for having made it. It presented the issue in proper form and I agreed with what he said. It is my opinion that an erroneous impression of the Smoot case has gone abroad, and that many good people have wrong ideas of it. I am glad Senator Knox corrected these mistaken ideas."

Senator J. C. Burrows

The Smoot case reached its climax at last on Wednesday. It has dragged long enough, but by that means it has received almost unlimited attention—and cost the country a lot of money. For three years the Senate Committee on Privileges and Elections, with Senator Burrows as

chairman, has been hearing every witness that could be called and examining an almost inconceivable amount of testimony. For three years Reed Smoot has been kept on the anxious seat, with hundreds of thousands of excellent women waxing furious against him for no reason but that he was a Mormon, while the Senate Committee, under the guidance of Senator Burrows, has been seeking and sifting to find out whether the Constitution gave them authority to comply with the voluminous demands and expel innocent, agreeable and wholly unoffending Smoot.

If the people could only have seen it in the right light, as Dr. Edward Everett Hale says, they would have realized that all the memorials, petitions and applications they have been hurling at the Senate were wretchedly out of place—little less than criminal contempt of court—for it was only as a court that the Senate could consider the charges. They should have presented their evidence and rested there. This deluging the Senate with petitions and then filling the press with anathemas and threats against all who held views to the contrary has hurt their influence. They will see it so some day.

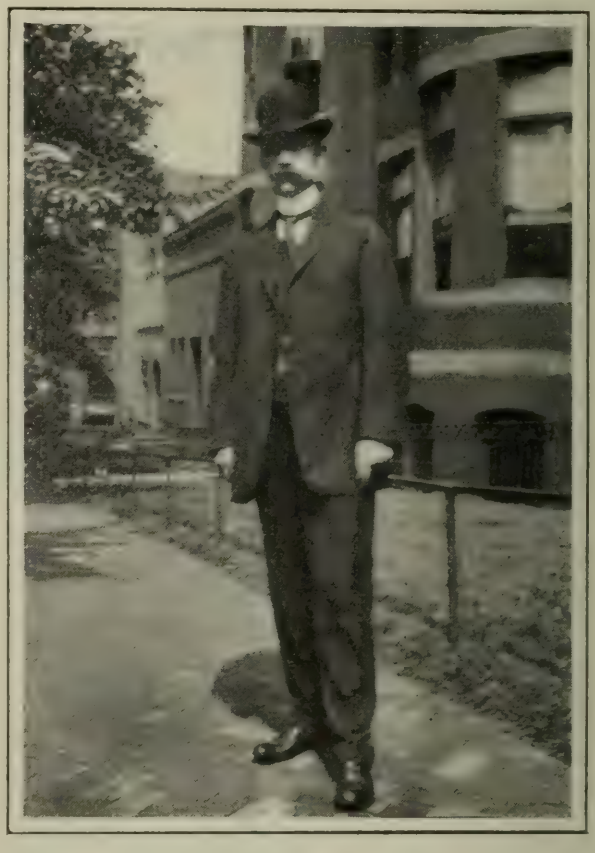
They could have found no better advocate of their theories and wishes than the Hon. Julius Cæsar Burrows, of Michigan. Of all the Senate he had inherent —almost pre-natal—antagonism against all things Mormon, which incited him to leave no stone unturned to carry out the effort. Sylvester Smith, the notorious Mormon who was finally expelled from the Mormon Church for grave irregularities, was brother of Senator Burrows's mother. She doubtless believed in her brother and considered him a victim of Mormonism; so that almost from birth, from his uncle and his mother, Senator Burrows must have heard all that there was to hear against the Mormons. It is a bit of the sarcasm of destiny that the nephew of the expelled Mormon should sit in judgment to expel a Mormon Senator.

But Senator Burrows is a just man. A man whose sterling integrity no mortal could impugn. He is built on honest lines—upright and downright. He shows it in every inch of him. He is seventy years old, and his white hair and full white beard indorse it; but nothing else. He is a large man, with broad shoulders and full chest, with eyes that are quick and keen and a voice as strong and clear as it used to be when he was an officer, back in the Civil War. He stands as straight as he did then, and has the strong, quick swing of the soldier about him yet. He never bends from the conscious dignity of his past and his present, but he is one of the invariably courteous and cordial men you are always glad of an excuse to meet. He has democratic

SENATOR J. C. BURROWS.

appreciation of the constitutional equality of men, and a smile and hearty handshake for whoever comes. In return one instinctively trusts Senator Burrows and believes in him.

Burrows is an able man and an eloquent speaker. It is not often that the Senate hears him, for he is not one of those who jump up and fire, no matter what, the moment a target is set up. He waits till he has something to say, and says it in a way to command attention and carry conviction. No man in the Senate speaks to better listeners. When he opened—and when he closed—the Smoot case every chair in the chamber



was filled, and many were drawn over from the House. He has a masterly command of English and spoke with the courage of his convictions—tho it was a hard task, for Reed Smoot has not a better friend on the floor than Burrows, of Michigan. He is too just a man not to appreciate the personal qualities of the Senator from Utah, and he freely acknowledged them in that speech, when for three hours and a half he held undivided attention to his eloquent and rhetorical recital of the conclusions he drew from the long investigations. It was one of those pictures which will never fade—one of the graphic, almost tragic, memories of the Senate. He faced Smoot squarely thruout, and Smoot sat with his eyes fixed on Burrows from the beginning to the end. A few feet from Smoot sat Edward Everett Hale, in his black, flowing robes.

Burrows's speech was as strong as could have been prepared upon the subject, and as effectively delivered. It might not have changed the result, but if two or three of the bitter, vindictive tirades which followed had been left out, the case against Smoot would at least have stood much stronger. The venomous slashing which Smoot and Mormonism received later, with such evidently sinister motives, did all that was possible to mar the dignity and force of Senator Burrows's presentation.

Reed Smoot

The man who has called out the eloquence of Knox and Burrows and a dozen more, the memorials and petitions of hundreds of thousands, and three solid years of investigation, is as retiring, unobtrusive, inoffensive and friendly a man as could be found. He is certainly a man of phenomenal self-control, too, or he never could have sat thru all the gratuitous attacks and insults of the past three years with that imperturbable courtesy and ready-to-meet-you-halfway cordiality unruffled. I have had to know Smoot rather well thru these years, and have often talked with him confidentially on matters that most interested him, and whatever else ought to be said or ought not to be said, this at least he deserves: I never heard him say one word indicative of ill feeling or resentment. I doubt if any one has known him to bite back, however grave the temptation or good the opportunity.

It is not because he is incapable. Some have said that he was not the caliber of a Senator. Well, there are a goodly number more in the sacred chamber today who have never yet betrayed any adequate excuse for being there, and who distinctly lack Smoot's obvious reason for it: that he has been so much an issue himself, ever since he assumed the toga, that he has had little opportunity, and has always doubted the propriety of

SENATOR REED SMOOT.

making himself evident in other issues. The fact that he has been under constant uncertainty as to his right to be there and been looked upon by his colleagues —more emphatically by the public—almost as a usurper, has handicapped even his manner of moving about the Senate corridors.

At home he proved himself an energetic and successful business man. In the Senate he has at least won the respect and friendship of the great majority on both sides, for good qualities which he has thus far been able to exhibit—which is saying a good deal, un-

der the circumstances. For years now he has been pointed out and stared at as the wild and wicked apostle of the Mormon Church, who had stolen into the Senate and was to be kicked out again. It has not been inspiring to growth in statesmanship.

Personal contact with Smoot fails to disclose apostolic terrors quite as much as any lack of Senatorial timber. Apropos, I hear that a delegation of ladies was assailing Senator Proctor, in the Marble Room, demanding that he denounce Smoot, when the tall, thin, pleasant-faced, good-foreheaded Utah man came silently, timidly down the room. Senator Proctor beckoned, and as he came up said, in his thunderous voice:

"Ladies, this is Senator Smoot. Let me introduce him."

The ladies gasped and shuddered, while Smoot bowed pleasantly and smiled. He always smiles if one is half willing to have him. One of the ladies gathered herself together and said, truly, perhaps:

"We were telling Senator Proctor about a memorial hall we want to erect."

Smoot listened politely as she described it. When she finished he slipped a twenty-dollar bill into her hand, saying: "It seems a very worthy object. Thank you for giving me the opportunity to contribute." With another smiling bow he disappeared.

No one claims that Reed Smoot has ever anything but frowned upon polygamy. To see his wife would be sufficient evidence without more. She is a charming, delightfully cultivated little woman, with rosy cheeks and laughing eyes. One would think her something short of thirty, but the first you know she is talking of her six children, the oldest a six-foot boy of twenty, the youngest a little girl who says: "I wants to go where papa works and tell zose men he is just ze bestest papa zat ever lived."

I fancy she is right. Smoot looks and talks like a man whose home life is what it should be. He is forty-five years old, born and college bred in Utah. He has a good face and particularly good eyes. He has had a stormy passage of it thus far, but he has qualities of greatness, which may yet develop, if there is truth in what a wise man once said about one being greater who bridled his tongue than one who took a city. He has the reputation in the Senate of being an honest, earnest, conscientious man. He shows it; and, as such, credence should be given by the world to his sworn statement before the committee that there was nothing in any oath which he had taken or vow he had made in the Church which could conflict with his duties as a citizen or a Senator. The final vote on his case last week—42 to 28—shows that the Senate is with him, and he will hold his seat.

WASHINGTON, D. C.

The Will o' the Wind

BY M. C. SKEEL

WHEN the wind was dancing, as the wind will dance,
With rustle and whistle o'er hillock and lea,
I said, "I will leave all our meeting to chance;
I'll seek no lover wherever he be."
So I closed my eyes and I backward turned,
And the breeze was fair in my blinded face,
Then all in a moment it whirled about
And blew me straight to the trysting place

O hither, thither, whither, and blow, wind, blow,
From north to south, and from Spain to Ind;
But never, never, never may the wisest know
How to reckon with the will o' the wind

The wind blew roughly, as the wind will blow,
He called me false, and I said "Farewell!"
He vowed far away to the East to go,
And free himself from my heartless spell.
But the wind roared out from the stormy east
And tost him back to the waiting shore;
Lo, while I sorrowed and love increased,
It blew him in at my cottage door.

So hither, thither, whither, and blow, wind, blow,
From north to south, and from Spain to Ind;
Yet never, never, never may the wisest know
How to reckon with the will o' the wind.

WESTERVILLE, OHIO

Literature

The Spanish Inquisition

THE third volume of Dr. Lea's monumental work* appears at an opportune moment. From it the "Undistinguished Heretic," whose confessions, in the issue of January 10th, have aroused so much discussion, may learn what would have been done with him had he lived in Spain three hundred years ago. Some chance word, some expression of sympathy for those theologically without the pale, would inevitably have been reported to the argus-eyed guardians of the faith; there would have followed an arrest as mysterious as if the earth had opened her mouth to swallow him up, like the impious Korah of old. The walls of Spanish prisons were thick, the silences interminable. The accused was not told the precise charge against him; enough that it concerned the faith. He was left to search his own heart and confess all his doctrinal shortcomings, to the saving of his soul. But this confession brought no relief, for the inquisitorial process must always take its appointed course. He must inevitably undergo torture; if pleading innocence, to test his sincerity; if admitting his guilt, to induce him to betray all confederates and sympathizers. The interests of the accused were in the hands of a so-called advocate, pledged to drop the defense if personally convinced of his client's guilt; by the middle of the sixteenth century he had become a salaried official, whose chief function was to urge the prisoner to confess fully. With sham counsel, the alleged culprit entered on a trial, often conducted at great expense of time and foolscap, and always paid for out of confiscated estates. He was confronted with no witnesses; he was not even told who they were; nay, during a great part of the life history of the Inquisition the evidence for the prosecution was mutilated in order to prevent, if possible, the defendant from inferring the identity of the witnesses. Presumed guilty until proven innocent, the prisoner's interests were safeguarded only by his judges, and these, however conscientious they might happen to be, "habitually served as parties to the prosecution." Thus the odds were long against acquittal. The system was such that even if, under the pangs of ingeniously graded torture, the victim did not confess crimes he had never committed, he was liable to go to the stake as a *negativo*—one who persistently denied the charge of heresy preferred by witnesses to him anonymous. Hence might occur grim travesties of justice. If the *negativo* would but admit his guilt, his merciful executioners would see to it that he was garrotted before he was burned; but cases are recorded where evidently the accused abhorred from the bottom of his orthodox soul the heresy for which he had been brought to bar, and preferred slowly roasting alive to going before his Maker with the lie upon his lips. In contrast with this style of procedure, our own cumbersome jury system, with the thousand loopholes where the guilty may escape, seems well-nigh ideal; and even the publicity of the yellowest of yellow journals would appear to be a boon.

In fairness to the Inquisition Dr. Lea shows that its methods compare favorably with those of Spanish secular courts, that in some ways it was more humane than the older Episcopal and the younger Roman inquisitions. It is made equally clear, however, that the Spanish tribunal was, when abused, a formidable engine of graft and of irresponsible oppression; it was so easy to shut a man up in secret prison, to confiscate his property, and thus to ruin his family for generations: for the kin of a heretic were tainted, just as were the descendants of Jews.

One is apt to imagine that the chief business of the Inquisition was to ferret out Protestants. Dr. Lea has compiled statistics which prove the contrary. So thoroly did the organization do its work during the short Lutheran scare of the sixteenth century that Spanish dissent was nipped in the bud; subsequent arrests are chiefly those of Huguenot and Anglican traders and sailors. In the sixteenth and seventeenth centuries the se-

* A HISTORY OF THE INQUISITION OF SPAIN. *By Henry Charles Lea.* In four volumes. Volumes I-III. New York: The Macmillan Co. $2.50 each.

cret adherents of Judaism and Islam were far more numerous than were the Evangelicals. Among the moral offenses of which the tribunal took cognizance were solicitation in the confessional, and the assertion that fornication is not a sin; the latter was a very common heresy in the district of Toledo about 1600. In later periods the number of trials for sorcery increases, a part of the great witchcraft delusion. Between 1721 and 1727 the Judaizers are the chief object of persecutions, for the barbarous expulsion of the Jews in 1492 had induced many feigned conversions. Among the saddest chapters of religious fanaticism and race hatred is the fate of the converted Jews and Moors, here graphically depicted.

Dr. Lea points out the effect of the Inquisition on the national character. Not alone on works of art did a strict censorship revenge itself. Rigid rules hedged in the printers, and the supervision of literature was made complete by requiring that all packages of imported merchandise be searched for concealed books. All works brought into the country had to pass the inquisitors. The Spanish intellect was further protected by prohibiting study at foreign universities, with the exception of one or two Catholic centers such as Rome. Spain became a hermetically sealed hothouse of orthodoxy. Independent thinkers had to pass their days in silence and conformity, and must have found splendor of ritual but a sorry substitute for the freedom of spontaneous faith. In place of courage and confidence, there was a brooding cloud of suspicion, cruelty, race hatred. With the hardening of heart went a progressive induration of intellect, which made void the literary promise of the sixteenth century: "the arts and sciences were neglected, commercial and industrial progress was rendered impossible, and the character which Spain acquired among the nations was tersely expressed in the current saying that Africa began at the Pyrenees."

The narrative, based on most painstaking combination of sources scattered for the most part among the archives of Spain, is not always light reading. The frequent occurrence of detail and technicality is more than compensated for, however, by the concreteness and vividness of many an incident of high dramatic worth. Written in the impartial spirit characteristic of the author's earlier publications, this is the crowning achievement in the career of the octogenarian who is generally recognized on the Continent as second to no other American historian.

Musical Culture

Such a book as Daniel Gregory Mason's *The Romantic Composers*[1] shows the extent to which musical appreciation has become part of the general equipment of educated men and women. This series of essays, tho they would be both serviceable and satisfactory to the professional musician, are quite intelligible to the average reader, and will find their best public among concert-goers who wish to get the most out of their concerts. The introductory chapter, on "Romanticism in Music," treats the movement in this art as expressive of the romantic spirit of art in general, and thru this, of the human spirit that colored the civilization of the period. He shows the change from the almost purely objective art of pre-Beethoven composers to the subjective attitude of the Romanticists, to whom music stood as the supreme medium for the expression of human personality, and in a discussion both sane and sympathetic shows not only the immense possibilities of music as an expressive art, but brings out clearly the limits of its power. His discussion of program music in particular, and his forecast of present day tendencies will be especially helpful to the conscientious concert-goer.

This treatment of music as an expression of humanity gives vivacity to the six sketches that follow, of Schubert, Schumann, Mendelssohn, Chopin, Berlioz and Liszt, in which the personality of the composer is treated as it affects his music. These sketches, partly biographic, partly critical, will give to the average music-lover a much keener sense of values in the music of these composers. The brief musical illustrations are well chosen, and in speaking of them Mr. Mason employs little of the termin-

[1] The Romantic Composers. By *Daniel Gregory Mason*. New York: The Macmillan Co. Pp. 351. $1.75 net.

ology of the art. *The Romantic Composers* is intended to be read after the author's "Beethoven and His Forerunners" and before his "From Grieg to Brahms," the whole making a series of studies of composers and their music from Palestrina to the present day.

Oliver Huckel's version of *Tannhäuser*,[2] like his earlier settings of "Lohengrin" and "Parsifal," is intended to give the music-lover a better grasp of Wagnerian art by presenting the words of the music-drama, always of immense importance in the Wagnerian art-scheme, in a worthy poetic setting. Instead of the bold and jerky translations of the libretto books, Mr. Huckel presents a metrical version of the story of the play, reproducing the dialog and describing the action and circumstance. It is no great poetry, but it is dignified thruout, and reflects to a considerable degree the spirit of the original. The Foreword shows how from the three sources at Wagner's disposal — the old "Tannhäuser" myth, the "Wartburgkrieg" and the legend of St. Elizabeth—the poet's genius created a work of such tremendous ethical significance—a drama of mankind. The type and binding are restful and beautiful.

The author of *The Ethics of Wagner's Ring of the Nibelung*[3] is confident that she has discovered in the Ring Cycle "a logical and coherent ethical doctrine." She regards it

> "as presenting a panoramic picture of the evolution of the human consciousness struggling to free itself from the hampering conditions of self, until at last, selfless, it is lost in the Divine will."

In proof of this she retells in prose, and it must be admitted prosaically, the complete story of this drama of gods and men, and gives her interpretation of its complex symbolism. She does not profess that it is Wagner's interpretation, and the reader will not be apt to find it his own, but he will at least be drawn to think about it, and so, by getting more meaning from it, he will give to the music more power.

Famous American Songs,[4] by Gustav Kobbé, tells about everything one can in reason wish to know about some dozen native airs, ranging from "Home, Sweet Home" to the "Songs of the War." There is information not only about the composer and the conditions under which the song was written, but, wherever it has appeared under interesting circumstances, they seem to have been recorded in this pleasant and light-running book. It ought to be of value in the preparation of club papers, and it certainly does bring the forgotten composers of our American folk songs, such as Dan Emmet, who gave us "Dixie," to where we can feel a sense of direct personal gratitude.

Among the books for the musician's library ought to be mentioned the new and enlarged edition of Upton's *Standard Operas*,[5] which gives in a few pages just what the ordinary person wants to know about the plot and composer of an opera that he is going to see.

There are few singers in the world who could not profit at some point from a careful study of Mr. Henderson's recent book *The Art of the Singer*.[6] He is not a teacher of singing, but one of the oft despised class of music critics; yet he has devoted twenty-five years of earnest study to his subject, has observed the methods of many teachers, has heard and studied the work of the famous singers of the period and, best of all, has received from such pre-eminent singers as Jean de Reszke, Marcella Sembrich and Lillian Nordica information of the highest value and practical demonstrations of inestimable worth. He gives definite directions concerning fundamental breathing, tone formation and the various steps in voice culture. The student is warned against any supposed mystery in the art of singing. The importance of naturalness and ease in breathing and producing tones is emphasized. The earlier steps in the training are followed by instructions for the acquirement of agility, which comes alone by judicious practice, and while this is not the day of

coloratura singing, agility is nevertheless essential to every singer as a reserve store of technic. Without undervaluing beauty of tone the importance of enunciation is dwelt upon, as it should be, with insistence—"songs without words are written for instruments only"—singing mere sounds is senseless, tho its performance may please the ears of an audience, and it is the artist who must educate the public. A strong plea is made for musical culture. Most singers, the author says, are obstinately one-sided practicers of their art. They should hear instrumental music, lots of it, should play some instrument, know something of musical form and master vocal sight reading—in short, they should make themselves real artists—and this is about the best advice of the whole admirable treatise.

Rosebery's Study of Churchill

Lord Rosebery and the late Lord Randolph Churchill were at Eton together; and from Eton both went to Oxford—Churchill to Merton and Lord Rosebery to Christ Church. Thereafter the association of the two men was social rather than political, for they were in opposing camps; but the friendship between them, which was really begun at Oxford in 1868, was continued until Lord Randolph's death in 1895. Lord Rosebery's monograph* has two phases—in part it is a review of Mr. Winston Churchill's remarkable life of his distinguished father, while for the rest it is what Lord Rosebery describes as a reminiscence and a study. There were times when such a work as this would have appeared first in the *Edinburgh Review*, for it has many of the characteristics that mark the earlier biographical studies in that famous organ of the English Whigs. But the *Edinburgh Review* is no longer doing its old service to English political literature. Times have changed. The reading constituency for such a work as this, written by a statesman of Lord Rosebery's distinction, has been enormously enlarged during the last twenty years; and thus we have this study of Churchill and of his part in English politics in book-form at first-hand, with none of the fading bloom that almost inevitably attends reprinting from a serial publication, however important that publication may have been or still is.

For Mr. Winston Churchill's work Lord Rosebery has nothing but praise. Among English political biographies he groups it much where it was grouped by The Independent when the biography was published in New York a year ago. "Mr. Winston Churchill is," he writes, "to be congratulated on a consummate achievement. He has under great difficulties produced a fascinating book; one to be ranked among the first dozen, perhaps the first half dozen, biographies in our language."

It was remarked at the outset that Lord Rosebery's monograph has two divisions. There are really three—the review of Mr. Winston Churchill's work, reminiscences of Lord Randolph Churchill, and an estimate of his short but brilliant political career. Lord Rosebery's reminiscences of his Eton and Oxford friend are perhaps the most illuminating part of the monograph, for they are full of intimate touches, revealing a close and unbroken friendship, and a friendship that was replete with many personal confidences. It is in this part of the book that Lord Rosebery is best able to supplement Mr. Winston Churchill's two large volumes by bringing out aspects of Lord Churchill's character of which it was practically impossible for his son, who was little more than a boy when his father was prominent in English political life, to write.

To some extent the estimate of Lord Randolph Churchill is also supplementary to the biography; for no son could express himself regarding the career of his father with the freedom and the confidence that marks Lord Rosebery's appreciation of Lord Randolph. In this matter Lord Rosebery enjoyed an exceptional freedom, for he was not of the same political party as Lord Randolph, and he was thus able to regard him from a more detached point of view than men who sat on the same side of the House of Commons, or who served with Lord Randolph in the two Salisbury Cabinets, of which, for brief periods, he was an intractable member. Lord Rosebery's ear-

* Lord Randolph Churchill. *By Lord Rosebery.* New York: Harper Bros. $2.25.

liest estimate of Lord Randolph—that to which he gives first expression in his monograph—is that he was one of the most remarkable men with the most remarkable career of the Victorian era. His definite career did not extend beyond six years. During that time he gained signal victories in Parliament, in the country, and in the counsels of the Tory party. But somehow all these victories and the hold that Lord Randolph Churchill had for a brief space on the country were fruitless and barren. Thus it is that the best that Lord Rosebery can say for his friend is that "even with his unfulfilled promise he must be remembered as one of the most meteoric of Parliamentary figures, as the shooting star of politics, and as one who when in office strove for a broad and enlightened policy, to which he pledged his faith and his career."

Few men have been more fortunate than Lord Randolph in their biographers. Fewer still have had added interpretations of their lives from so discriminating but always sympathetic a critic as Lord Rosebery in his study of Lord Randolph Churchill.

Three Garden Books

In the preface to *The Garden and Its Accessories*[1] the author calls himself a landscape architect. Mr. W. Robinson in his *Garden Beautiful*[2] greatly objects to this name, for he says the landscape gardener and the architect are two different professions and should not be named together. The many interesting illustrations of Mr. Underwood's book seem to show a reasonable connection between architecture and gardens. The pictures are upon highly glazed paper. The text is chiefly a running comment on the illustrations. They are suggestive and suitable for formal gardens, and the pretty dovecote on a column of field stone would be charming in any garden. The gazing-globe may be interesting and delightful in color, but exactly in the middle of the door of the summer house it makes the composition of the picture bad and looks like a lonely fence-post. It is fully as bad on the terrace. Pergolas and garden houses are always charming additions to a garden. In the chapter on fences there is the heavy cannon-ball post fence, but not one with the graceful urn above, as seen in old New England gardens—an illustration of one is in the frontispiece of Sara Orne Jewett's "Deep Haven." The composite is said to be the coming style for gardens—a natural garden, with some architectural conveniences and ornaments. This book gives examples of such garden accessories, which may be useful to lovers of gardens.

The Garden Beautiful is written not for small land owners, but for those owning large estates or tracts of land that can be planted with forest trees and wild flowers. Mr. Robinson has no patience with any one who differs from his ideas of landscape gardening. Watts said, when translating one of David's psalms: "Cursing one's enemies is not so evangelical a practice, therefore I have given this psalm another turn." It might have made a smaller book and been more evangelical, tho less racy if the abuse of other writers had been omitted. There will always be those who love the formal garden and those who think landscape gardening is the only desirable thing. Each style of gardening, if well done, has its own beauty and place. Mrs. Van Rensselaer says:

> "If we use our minds and eyes we find no reason to think that formal gardening and naturalistic gardening are deadly rivals, each of which must put the knife to the other's throat if it wishes itself to survive. There is no real opposition between the two systems, widely apart tho their extreme results may lie."

Edward Andre, of France, says:

> "Three styles may be recognized—the geometrical style, the landscape style and the composite style. The mixed or composite style results from a judicious mingling of the other two, under favorable conditions; and, to my mind, it is to this style that the future of gardening belongs."

Altho Mr. Robinson sees nothing good except landscape gardening in his preface, he allows that "small gardens are often the most beautiful and best for the happiness of their owners." John Ledling calls the garden "outdoor scenery neatly writ in man's small hand." Mr. Robinson's book is written "for the many who have greater opportunities." His

[1] The Garden and Its Accessories. *By Loring Underwood.* Boston: Little, Brown & Co. $2.00.

[2] The Garden Beautiful. Home Woods. Home Landscape. *By W. F. Robinson.* New York: Charles Scribner's Sons. $4.00.

knowledge of plants, shrubs and trees is delightful. He is wise in urging the planting of native shrubs, trees and plants. His directions for the planting of forests are valuable. But he scorns the agricultural schools and colleges, and has written a whole chapter against the use of Latin botanical names. This book is most valuable in England, as it is written for that climate. But his careful list of trees with directions where each should be planted, his lists of shrubs, and the true love of nature that runs thru the book will make it one that owners of woodlands or large estates will enjoy and find useful in spite of the mustard and pepper with which it is highly seasoned.

If one wished to make a garden tour thru England, as cathedral tours are sometimes taken, the *Book of English Gardens*[1] would prove a useful guidebook. Altho the first chapter is on gardens, and gives a short history of gardening, telling part of what is so ably told in Lady Amherst's book on "English Gardens," yet the book is not so much a garden book as a description of the "ancient homes of lord and lady, built for pleasure and for state." The garden is the out-of-door drawing-room and the good or bad history of the princely or royal folk who walked in each is carefully given, in connection with the house. The book is dedicated to Mary, Countess of Ilchester, and the first garden described is hers. There is a chapter on Cottage Gardens, and another on A Modern Garden, Surrey. Can this be the garden of Mrs. C. W. Earle, the author of "Pot-Pourri from a Surrey Garden?" There are twenty-four illustrations from water colors. The most charming, as a picture, is the Lavender Garden Knole. The book is full of laboriously collected information connected with the family history of the owners of the famous houses and gardens in England. They are the homes and gardens of the titled rich. The book has the interest of an old curio.

The Amulet. By Charles Egbert Craddock. New York: The Macmillan Co. $1.50

This is probably the best of Miss Murfree's stories of pioneer life in Tennessee. She writes now with more elegance and scholarly precision than in the old days when her tales of the Smoky Mountain region were so popular, but never with a finer sense of artistic effects. Considered simply as a story, this new book should prove interesting to those who care for the adventurous life of a pretty English girl in a military camp surrounded by Indian villages. But that which gives the volume a permanent value is the amount of historical information it contains about Indian customs, religion and points of view. These are so managed as to become essential parts of the romance, and the result is better than the bloodthirstiness for which the Indian usually stands in American fiction. "The Amulet" is a priceless pearl which is given the pretty heroine by the "beloved men" of the Cherokees as a charm against dangers and misfortunes because she restored to them the great red ruby which had been taken by a young officer of the garrison from their sacred village, and which they regarded as the symbol of their religion. The whole story is as natural and freshly told as if the author herself had been the heroine of the happy adventure.

A Lady of Rome. By F. Marion Crawford. New York: The Macmillan Company. $1.50.

When it comes to realizing Rome in fiction there is no one like Marion Crawford. Others write tourists' romances of Italy, but Crawford is so much at home there that he omits the spectacular details which catch the transient eye and presents life in its natural and historical relations to the scene. He has embodied in the characters of his last story the sedateness, the piety and the elegance of high life in modern Rome without the least of that affectation or that booming of words so noticeable in other authors who undertake similar scenes and situations. It is also an evidence of grace and mastery in a novelist when he can dramatize the good rather than the evil in men and women, and lend to his composition an interest and a charm quite beyond that of the sensational artist. The sin and repentance of a noble Roman lady constitute the tragedy of this story. But em-

phasis is laid not upon her fall, but upon the natural ways and means by which such a woman would strive to save herself. The fortitude she displays, the simple yet terrible sincerity with which she binds herself to duty cannot be described without producing the idea that the story is strained and morbid. And this it is not, showing again the author's admirable mastery over those realities in life out of which pure romance comes, the fire, the essence of the whole thing.

Listener's Lure. A Kensington Comedy. By F. V. Lucas. New York: The Macmillan Co. $1.50.

This volume is composed of letters from an English gentleman to his ward and from half a dozen other people related by fact or correspondence to the situation. The author who is master of one good literary style is usually considered fortunate, but here is a writer gifted with as many fashions of compositions as he has characters in his story, and all equally winning. The letters from Lynn Harberton recall the differdence and delicacy of Amiel, while those of Dennis Albourne are admirable essays which touch life here and there as a fine artist might copy scenes from nature. Equally interesting and diverting are the letters from various women of varying ages and points of view. The high tides of love and life are represented by a series of absurd telegrams exchanged between two university students. In short, it is the best of England, old and new, told at random in letters which also serve to piece out one of the prettiest love stories of the year, but the title of it is founded upon so trivial a circumstance as to be almost a meaningless alliteration.

A Much-Abused Letter. By George Tyrrell. 12mo, pp. 104. New York: Longmans, Green & Co., 90 cents.

Father Tyrrell was, a few months ago, recognized as the ablest British Jesuit, and yet liberal, for a Catholic. Prof. St. George Mivart, a distinguished biologist, since deceased, wrote Father Tyrrell asking how, with the light that comes in science and criticism, he could remain a member of the Catholic Church. This book contains the answer given; but Mivart's published views were condemned by the Church, and he died not in its full communion. Meanwhile Father Tyrrell's private letter passed from hand to hand, until an Italian journal took the liberty to print extracts from it as an example of the extreme liberalism that had invaded the Church. Then came the explosion. The head of the Jesuit order required an explanation, which was not satisfactory, and Father Tyrrell was expelled from the order, and forbidden to exercise the functions of the priesthood. In this volume he publishes and defends the letter. Its essence is certainly radical, and is intended to meet the esoteric needs. Under its principles creeds are the habiliments of faith, not its body. The same is true of ecclesiastical forms and organizations. The Church is to be maintained as the needed means of advancing goodness and that which works for righteousness; while one can worship the "Christ-Crucified" in the succession of those who have suffered for goodness. It is much the doctrine of that essential religion under all forms which students see in the study of Comparative Religion; and it is an illustration—very important and interesting—of a movement of thought in the Catholic as well as the Protestant Church.

King Philip's War. By George W. Ellis and John E. Morris. In the "Grafton Historical Series." New York: The Grafton Press. $2.00.

This new study upon *King Philip's War* is a useful chapter in the history of New England, in spite of an unfortunate beginning. Its paper wrapper distorts an intimation of the preface "that as between races ethics rarely exist" into a categorical statement that "ethics do not exist between races and nations." And the first sentence of the book speaks of Verrazzano and Champlain as explorers along the New England coast in "the opening years of the seventeenth century." If the book as a whole were as inaccurate as this grouping of men a century apart would indicate, or as misleading as the perversion of statement would suggest, we would have none of it. But it proves to disclose a better character to a persevering investigator. The Indian

war of 1675-1676 marks a stage in the struggle between the races for the continent of North America. Had the Indians been wise they would have destroyed the early bands of pioneers who settled upon their coasts. There was no great spirit in the early colonization, and with small resistance it might easily have been long deferred. But the Indians encouraged the white men who were to encompass their destruction. So long as Massassoit and Canonicus lived there was no war; yet before they died the expansion of the fields of the English made conflict inevitable, and in the reign of Philip the struggle came. The Indians delayed the fight until its result was determined before it was begun. As between a hunter tribe and a resident agricultural population there can be no long enduring question of supremacy. The book before us goes in great detail into the history of these two years of colonial war. It describes the conditions prevailing in New England in 1675, and after an account of the opening Swansea campaign goes into the actions in the Connecticut Valley. In their footnotes the authors reveal a wide acquaintance with the published documents of the Colonial period. The correspondence of the Colonial Governors is heavily and effectively drawn upon, so that the notes are a convenient guide to the further history of the years in question. The genealogical interest of Mr. Morris has resulted in a collection of biographical details that must make the book valuable to all tracers of New England ancestry. Indeed, one criticism of the book as a book lies in its multiplicity of names and explanatory notes.

This Was a Man. By Hattie Horner Louthan. Boston: The C. M. Clark Co. $1.50.

Is there such a thing as reversion to type in fiction? How shall we describe a modern novel which has been founded upon one of the oldest plots ever used in fiction. The wronged woman manages to exchange babies at the crucial moment, so that the rich villain brings up the child of his cast-off mistress in luxury, and condemns his own son to the despised position of a servant. That is the obvious part of the story, and the vulgarity of it consists in the author's effort to interpret the scandalous lives of two Don Juans by the free use of their own vocabularies. In the end, of course, the down-trodden young man who used to be the legitimate baby that was exchanged rises up hero fashion and asserts himself with great *eclat* and claims the heroine for his wife in the most spectacular manner.

Historical Greek Coins. Described by G. F. Hill, M.A., of the British Museum. Pp. xix, 181. Thirteen plates. New York: The Macmillan Co. $2.50.

The author has followed the plan which Canon Hicks took in treating historical inscriptions, selecting those coins which throw light on history. "No historical problem," says the author, "should be attacked without asking: 'How will the coins help us?'" Aegina, one of the earliest cities to control the Aegæan, spread everywhere coins bearing a tortoise, which referred to Aphrodite, whose ancient temple recently excavated lay in the city. The coins had on the reverse an incuse square of five unequal compartments, a feature repeated on a coin of Bœotian Orchomenos, which seems to prove that this city, so remote from Kalauria, the religious center of the league, was a member, altho all the others lay on the sea. Orchomenos, however, had only slight obstacles in reaching the sea. The influence of Crœsus on Greece is seen in very old coins with the fore parts of a bull and an open-mouthed lion confronting each other. How near a single coin brings us to the rich king who fared so ill at the hands of the Delphic oracle! One of the most suggestive of coins is the Damareteion, struck at Syracuse in 480-479 B. C., when the combined forces of Akragas and Syracuse annilated an enormous force of Carthaginians. This beautiful silver decadrachm, which has some reference to Gelon's queen, has archaic restraint. It is a real work of art of that period. The driver leans forward, and his dress is blown backward. A winged Nike is flying onward; but the horses' legs are stiff. On the reverse is the nymph Arethusa, with olive-wreath, necklace and earrings. The lion on the obverse

and the dolphins on the reverse are full of animation. Nearly seventy years pass, and Syracuse again strikes decadrachms as a trophy over the annihilated Athenian invaders. What a change in the art! The face of Arethusa and the quadriga are turned now to the left. Arethusa is a stylish lady. What life in the horses! The charioteer leans forward with his goad, and Nike rushes to meet him. But this joy and pride awaits the Semites with their revenge for Himera; and it came quickly. A coin of Thessaly, bearing the head of the nymph Larisa, and on the reverse a grazing horse with the letters ΛΑΡΙ above him and ΕΙΜΟ in smaller letters under his belly, tells a tale of some interest. No doubt we have here a coin of the Aleuad Simos, a warm partisan of Philip, who, according to Demosthenes, was cast aside with contumely when Philip had used him for his own purposes. In 306 B. C. Demetrios Poliorketes inflicted a crushing defeat on Ptolemy off Cyprus; and on a coin of that date appears the prow of a trireme with Nike on it trumpeting out the glory of Demetrios and his father, Antigonos, who, as well as the son, assumed on this occasion the royal title. A special interest attaches to this coin, since it reproduces the Nike of Samothrake in the Louvre, whose noble poise and swing gave evidence that statuary had not lost its power.

Evolution of Weights and Measures and the Metric System. By William Hallock, Ph. D., and Herbert T. Wade. New York: The Macmillan Co. $2.25.
